America can have no excuse for the lack of distance runners in this country. We have many first-rate sprinters, and yet most of our high-school stars and excellent college prospects are "burned out" early. In distance events there are fewer good performers and these must be nursed along carefully. The remedy is in our hands. If high-school coaches will only try to develop their men more carefully and avoid letting the growing athlete reach his full strength too soon through excessive competition, the result will be beneficial, for, even if they are abused thereafter, they will at least have had a chance to attain fair strength before they are offered to an almost year-round competition in hard races. Colleges will benefit this country if they insist that their athletes do not compete in open meets, at least in open indoor meets, while they are attending college. It takes years to develop good distance men and they must be brought along gradually. One season of overwork can easily ruin a man's entire athletic career.

A New Day Dawning for the American Garden

Garden Clubs Are Now Introducing a New Movement in Horticulture

By E. I. FARRINGTON

HORTICULTURE in America is undergoing a revolution. American women have brought it about. Until within a very few years ornamental gardening in this country was carried on in the most haphazard and unorganized manner. There was none of the co-ordination which has made gardening an art in Europe, none of the co-operation which produces a national type.

There have been gardens, of course, ever since the days when Washington planted his neat hedges of box at Mt. Vernon and the old sea captains of Salem filled their back yards with hollyhocks and larkspurs. There have been brilliant landscape architects who have laid out magnificent estates from Maine to California, but garden making as a coherent expression of American ideas did not exist until women here and there began to form little garden clubs, bringing their influence to bear on seedsmen, nurserymen and landscape architects. So prompt and so surprising were the results that now they are to be found in every state, hundreds of them, and their federated organization, the Garden Club of America, is probably the most powerful force for horticultural advancement on this continent.

In former times the foreman or superintendent of an estate was a law unto himself. He regarded his employer's ignorance with amused tolerance, but bought what he chose and planted where he pleased. His employer respected his scientific knowledge, interfered but little with his plans, and paid the bills. As a result, most large places expressed the personality of the gardener and not that of the owner.

Commonwealth, a new rose.

All this has been changed. As a rule, the employer still stands aloof, but the employer's wife knows every plant that goes into the ground and plans every important change that is made. The gardener works with her and not merely for her. In many instances warm friendships, based on mutual respect, exist between the mistress of a country home and her superintendent. The latter would not think of making a new rose bed or changing a border without a consultation. The women of America are studying the art of garden making with an earnestness and an intelligence that is reflected in better gardens, more attractive home grounds, and a higher type of horticulture in all parts of the country. Some of the most valuable garden books of the day have been written by women. Mrs. Edward Harding is a wealthy estate owner in New Jersey, but she works with her own hands, and her book on peony growing is the recognized authority. Mrs. Charles H. Stout, another New Jersey woman, has written the only important book on dahlia growing now to be found. Mrs. Francis King, of Alma, Michigan, the dean of women garden writers, has produced several books that have had a profound influence on the development of gardening in this country. Mrs. King has also been given the George Robert White medal of honor for eminent service in horticulture by the Massachusetts Horticultural Society, the highest award that can be made.

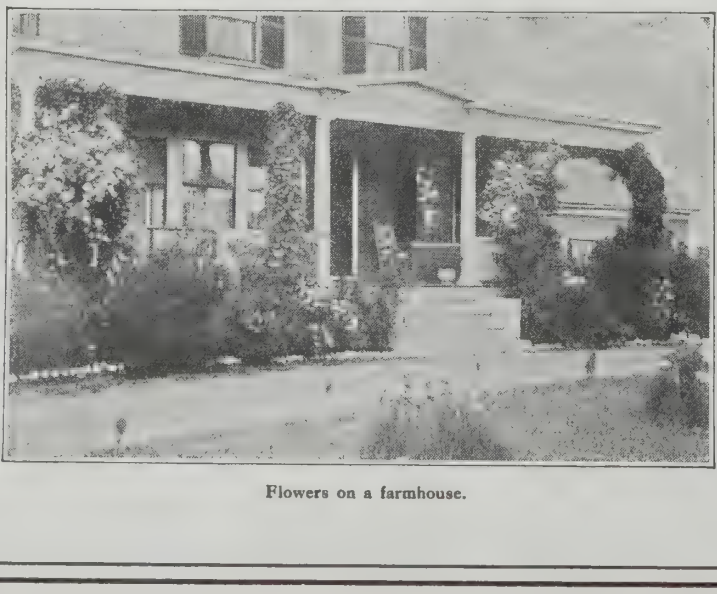
Many other women write for the bulletin of the Garden Club of America which contains, perhaps, more real, practical information on modern garden methods and the newer plants than any other publication on this side of the water.

A city garden.

Members of the club have gone further and have opened their gardens on certain dates to accredited members from any part of the country, resulting in frequent visits and bringing about not only a splendid feeling of comradeship but a welding of opinions as well, that is being felt by every seed house, nurseryman and landscape gardener.

It has always been the custom of men in the trade to grow and sell what could be handled in a large way with a minimum expenditure of labor. The result has been a tendency toward restriction, a tendency which is manifested in private hedges, specimen hydrangeas and Carolina Poplar trees. The garden clubs have insisted upon the finer, more refined plants, the novelties from Europe, the Asiatic shrubs introduced by the Arnold Arboretum, the choicer products of American hybridizers. This attitude has been of exceedingly great importance at this particular time, for importations on any large scale are made impossible by a very drastic (and what many persons consider a very arbitrary) ruling on the part of the Federal Horticultural Board at Washington. This ruling shuts out all plants which have balls of earth on their roots and many bulbs besides.

Roses, rhododendrons, azaleas and other plants were formerly shipped to this country by the thousands from Europe. Now they can be obtained only by special permit for propagation. The result has been that American nurserymen have been compelled to develop their own resources. But the whip of public opinion was needed to stir them to action. If left to themselves they would have grown and offered for sale only a limited variety of shrubs, comprising mostly the kinds easiest to grow. This is perfectly natural and offers no grounds for criticism. It would be the easiest way of making money. The awakened women garden makers of the country, however, declared that they would not be kept within any such narrow limits. They exhibited a surprising knowledge of the novelties available for propagation. They demanded that these novelties be grown. As a result a condition which seemed likely to beget only stagnation and apathy has resulted in the production of American-made plants on a scale never dreamed of in the past. At the same time, the amateur garden makers have not dropped their campaign for more liberal treatment from the Board at Washington, realizing that this country cannot live unto itself from a horticultural viewpoint if its gardens are to contain the best of the world's ornamentals.



Flowers on a farmhouse.

This country has come to excel already in the development of new roses, although the roses of Ireland and England are still prized. Each year sees introductions of merit, many of the best coming from the establishments of the Hills, father and son, in Indiana; and from the Montgomerys in Massachusetts, not far from President Coolidge's home town. Such roses as America, Angelus, Hadley, Commonwealth, My Maryland, Mme. Butterfly and Radiance will make any garden a delight. And the wonderful climbing roses developed by Dr. W. Van Fleet, M. H. Walsh, George Thomas and others have gone far overseas.

American peony, dahlia, iris and gladiolus hybridizers have given many wonderful new varieties to the world. Dahlia growers like to boast of the enormous size attained by their flowers. This tendency is being checked by the more progressive societies, which are insisting that dahlias shown at their exhibitions shall appear with long stems instead of being stuck into the top of a bottle. Now the cabbage dahlia usually has such a weak stem that the flower hangs its head as though ashamed unless supported, which militates against its exhibition in a long-stem class.

The flower shows of the country are in themselves an indication of the changes under way. Formerly milk bottles ranged row on row, each containing its one flower, were the rule. This arrangement is giving way to more decorative methods. Green burlap is replacing white paper on the tables. Baskets and vases are replacing bottles. More foliage is being used. The flowers are being grouped for decorative effect. Black velvet backgrounds, special lights and benches of different heights are adding to the effect. The garden clubs have pointed the way and the commercial exhibitors are falling into line.

Remarkable spring shows have been set up in New York for several years. In May of this year an international orchid show is to be held at Horticultural Hall in Boston which will surpass anything of the kind ever seen before on this continent. In the spring of 1924 a National Flower Show will be held at the huge new auditorium in Cleveland, preparations for which are already under way. Smaller communities everywhere are holding annual exhibitions which are reflecting both the love of the masses for nature's offerings and the newer ideas about displaying them to the best advantage.

There are national gladiolus, dahlia, iris and peony societies, and their conventions are always occasions of rare enjoyment. These societies have taken a very important step in starting test gardens and by making check lists, the purpose being to keep only the best varieties in cultivation and to avoid duplication.

As a culmination of the work of the different societies has come the book called "Standardized Plant Names." This book has been issued so that seedsman, nurseryman, botanist, author, and everyone dealing with plants and plant names has an accepted authority to follow which will make the catalogs easier for the amateur to understand, and planting directions easier to remember, a most desirable consummation.

Adventures in "Housekeeping" on a Railway

A Story in Which a Trip Across Canada Is Vividly Described

By A. R. PINCI

"IF YOU break those eggs you'll have to do without lunch!"

"I won't break them, mother, but I can't find them. Where are they?"

"I know I put them there, right next to the celery and the apples. They are in a cake box—"

"Oh!" It was an exclamation of petulant disappointment that surged from the depths of a juvenile heart—a very young one. "I thought that was cake."

"You shall have your dessert, Mary, because I packed everything we could use but we have three days to go and we must make everything count."

It was "mother" that was speaking.

There she was, in a washable silk waist and a sensible woolen skirt, and a very infectious if motherly smile, as she sat facing her daughter, aged about eleven, ready to do a little housekeeping—seventy-two hours of it—on a transcontinental train.

It was an interesting group of travelers in the tourist car that has made the Canadian railways noted if not famous; the car of the people for the people; the tiny home that permits of little rest from household cares to those who wish to avoid the commonplace comforts of the more formal and more expensive dining car behind.

I wanted to see how the Canadians do their housekeeping while traveling, or, more correctly, their traveling while housekeeping. So I became the possessor of a tourist ticket between Montreal and Winnipeg—half the transcontinental journey—at half the price for really almost all of the regular sleeping car comforts. The tourist car is just a wee bit less ornate than the more exclusive models after which they are patterned, but they are superficial simplifications. Instead of the customary green plush one begets artificial leather coverings that in warm weather are certainly cooler for sitting purposes. The only objection is that they show off the dust that the plush conceals and saves amid the fibers of its nap, but it's good exercise to blow it off. It strengthens the lungs. But there was a fellow traveler so powerfully lunged that he scattered his individual portion of Ontario dust all over neighboring seats. He was very generous with it—and with his snores, which also originated in his lungs.

At one end of the car there was the kitchenette. It was done in white tile, or a clever imitation of it, with its sink and running water, and the coal stove facing it across the space taken by the window.

Three meals a day for an average of twelve persons—the others being those who take their meals in the regulation diner, a privilege that graces the tourist-sleeper ticket—and each meal representing a variety of appetites and purses and *cuisines;* I call that a kitchenette in size but not otherwise. It's a kitchen, full-fledged and dependable that caters to individuals who in turn must cater to themselves when this duty is not a pleasing task; and I know of kitchens that cubically are much more extensive, much more fastidious, much more modernly equipped, that fail of their mission to feed—nay, to satisfy the inner man.

I have partaken of a complicated viand duly prepared in one of these kitchens, where every pot and kettle and pan and dish and fork was sterilized, scrubbed and polished, but when it comes to stimulating the nostrils, inspirit a lethargic stomach and excite the papillae of the tongue, through the delight of aromatic odors rather than the ocular enticements of suitably displayed eatables, the tourists' kitchenette gets all the gold medals, blue ribbons and diplomas.

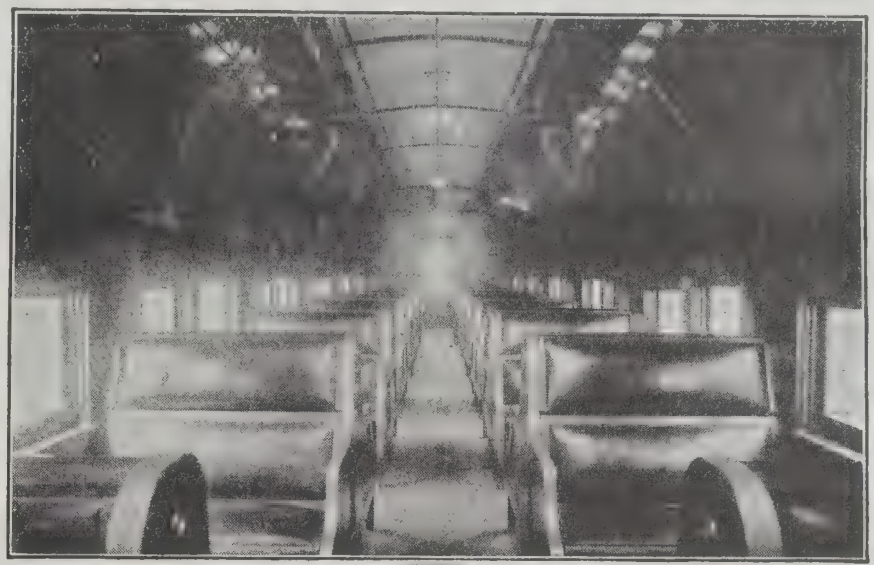
Lest I offend the sensibilities of an epicure I shall qualify to this extent; that I refer to individual odors and not to the ensemble, especially on a Friday, when fish holds the place of honor (especially if one happens to traverse the habitat of very religious peoples).

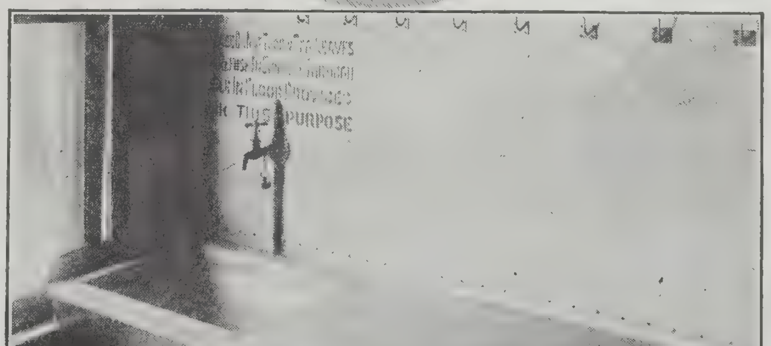
So while the very plain but businesslike mother was warning Mary to be careful with the eggs, my nostrils were dilating in response to the wafting forward of ham-like exhalations and another substance that I have failed to recognize. Undoubtedly it was a "folk" dish, because the gray-haired woman presiding over the diminutive kitchen had her mind on what she was doing—and that is more than can be said of many a woman today engaged in cooking. She looked like the sort of housewife that would delight to pierce a turkey with a spit and affectionately watch its turning over lambent flames. Have you ever seen a French peasant croon over a *poulet?*

It was an unusual crowd that was housekeeping and almost fraternizing while the miles were counted off under our feet. An aged couple; a woman with three grown-up sons; two spinsters; three men that believed in "saving fourteen dollars a head for four days of 'tourist' life"; two sisters; a man; another man; a bride; several children; two married couples; and one or two unremembered others.

It was typically Canadian in atmosphere; only one couple spoke French and originated somewhere in Quebec; all the others were Anglo-Canadians or Irish-Canadians. In general, however, they were all Scotch—they were so thrifty that they were afraid even of rubbing their hands upon the elbow rest—whether to save their skin or protect the brass lacquer I don't know. Thrifty but generous.

For here were chances galore to be a "guest." I could have eaten my way across Canada free of charge had I rotated as per invitations. Anything from a sandwich up to veal chops. It was shy on fuss—the kind of overdone, pampered table decoration that one gets almost anywhere in polite society these days—but long on food. Calories or vitamines—whatever it was, there was enough.





Above—Colonist car ready for day occupancy. Center—Cooking stove in colonist car. Below—Sink in colonist car.

The one drawback was bread; the second day from Montreal it was not especially appetizing and being inclosed in boxes, suitcases, paper sacks, napkins and the like, rendered it fit for puddling but nothing more unless one has a penchant for stale bread. The other drawback—but it had nothing to do with the cooking—was the heavily spearminted dessert affected by the following: one boy, two girls, one young woman, a man who with eyes closed was rendering an excellent imitation of a cow Fletcherizing meditatively (and there were hundreds of them on the pastures alongside our tracks) and one bride. If any of the others did it witness deponeth not.

If one wished to be captious a lament might be voiced about finding sundry orange or banana peels on one's window-sill, but one could not really get peeved about the unpremeditated decorative effect of such vivid hues at one's temporary casement. In my case it was the ambitious effort of a youngster who evinced his artistic proclivities as so many of us grown-ups used to do at about the same age. In fact, in honest-to-goodness boys' society, peels—especially banana peels—seem intended to ornate floors especially at those choice points usually selected by innocent passers-by, but no such thoughtless negligence marked our car. The floors could be walked on with impunity, for no banana peel would cause the floor to meet one's unequilibrated anatomy.

The aged couple was interesting. We shall call them Dobbs. Kindly eyed, cheerful faced, the expression of placid temperaments. It was not necessary to hear their story to fix, however approximately, their career of threescore years. Three children were theirs, and each male had strutted away to conquer new glories from nature, and so they settled, one in Manitoba, the second in Alberta and the third in British Columbia. As the parents belonged in New Brunswick it is evident that the Dobbs family "covered" Canada.

Well, Pa and Ma Dobbs were tired of being alone, even though prosperous sons came annually to visit them and tarry awhile, so they rented out their homestead, with privilege of purchase, and were migrating westward to rejoin their youngest son somewhere near Prince George.

"Ma" Dobbs told me that John—her baby—had fallen in love but that his girl died, and he wouldn't marry after that.

"Pa" Dobbs, with a knowing wink intended for me but which he was careful to conceal from "Ma"—a wink that sat well in that tranquil face—conveyed to me his belief that he doubted his son's avowed celibacy, and I believe he would have bet a whole Canadian dollar in support of that conviction against all comers—yes, except Ma. He let Ma have her own way, and it was evident that Ma, on her part, had always been equally conciliative, which accounts for their benign manner.

It was Ma, of course, that had been preparing the "folk" dish that had teased my senses—and it was Pa's favorite dish. It was plain, too. It consisted of potatoes cut into very small pieces browned in butter, with a great deal of finely cut parsley, and then the whole held together by one beaten egg.

There you are! How could Pa go four days without his favorite dish? It wasn't on the menu of the diner—and probably never will be, and here was Pa, his pockets well lined, evidently, with coin of the Dominion, producer, too, of potatoes, parsley and eggs and butter—all the fixin's—sticking to the simple life, and Ma herself happy now as she evidently must have been the first time she cooked it for him. That first time—you imagined you could almost "see" her think about it as a wistful look occasionally effaced her smile—the consciousness of life's approaching twilight.

But that was middle age, with its predilections—and here, by my side, was lusty youth, with its predilections, too.

Four women—the two spinsters and one young woman and one girl. In other words aged about as follows, since no beauty parlor embellishments had been practiced; thirty-four, thirty, nineteen, sixteen and a half. Don't be surprised if precision compels the inclusion of the half year, because the young lady herself had calculated her age but a few hours before during an argument she was having about age and ages.

It was this young lady—or girl, rather—who derived all the enjoyment from the game of cards they were playing. She smiled and laughed and giggled and sighed and twisted and pushed back rebellious hair and glanced restlessly about. Her partner was the young lady; the opponents were the spinsters. The latter were very friendly, but naturally not demonstrative, and seemed pained every time that a trick went against them, after which each would shake her head as if in extenuation of a recognized case of misjudgment. Then all would be serene again.

One carried a leather bag, fashioned like a purse, that hung from a shoulder strap. What that bag contained—that was the mystery that worried me. Every once in a while its possessor would open it and then shut it. I never detected anything emerge from it or go into it. It couldn't have been money since the woman was carrying travelers' checks; it could not have been jewelry. But as a mystery it was a huge success. My most inquisitive conduct failed to be rewarded, and the secret remained well guarded.

The two spinsters did not hanker much for light housekeeping on the car.

They had provided themselves with the wherewith for a few quick meals, but after the first luncheon they

(Concluded on page 14)

Adventures in "Housekeeping" on a Railway

Concluded from page 13

repaired to the diner and ate in style. Their first meal attracted my attention because the porter—a West Indian Negro who had distinguished himself in the war and was now studying medicine, by the way—had some difficulty in fitting the folding table into the lateral slots, and he tried several of them, even though they were, I believe, numbered.

But the table once in place—it was a regulation Pullman table over which in the States drummers classify their papers and annoyed travelers pretend to play cribbage—the two women arrayed it with sandwiches, fruit, two or three assorted jars that contained jams or marmalade, salt and pepper shakers, napkins duly folded into rings, namely: a pink one and a blue one; but with this result, that after half an hour or so there seemed to be as much on the table as there was laid out originally. There was no sign of a clean platter like Pa left after he got through with Ma's masterpiece. It's surprising how long it takes certain women to eat nothing!

The second morning out herring, or some such smoked fish, was olfactorily noticeable. It was evident that the alleged cook that was presiding over the fate of a poor fish that was born somewhere in Norwegian waters was treating it infernally in an undergreased skillet. I have known of such maltreated fish before, and I don't know just what culinary result boarding house cooks endeavor to reach, but I know this much—that one burnished herring of this kind will outdo, odoriferously, a ton of rose blossoms gathered at Grasse, in Southern France, for milady's boudoir.

One of the three men that were "roughing it" for the sake of economy at no expense of basic comfort evidently was awakened by the seared *Clupea harengus* fumes, and from within the green-curtained enclosure he declaimed something about breakfast.

That is a luxury that is not included in the more exclusive traveling circles aft, but in this case Lower 8 paid a tribute to the skillet, even though it was an unskill't one—and lo! here emerged No. 8 and then Upper 8 and Lower 10—the trio—who after a nod and a smile and a word directed their unsteady steps toward the diner, where together they seemed bent upon trying everything that Mr. Cooper provided for the inner man.

The bride—we mustn't forget her. She was alone. She was dressed in black. The only sign of life was her gum-chewing, unless it was a new way of talking to one's self. If so, she was a very talkative person. And because her nose was very retroussé the mobility of her lips and jaws seemed more emphatic. When she leaned her head back, her nose pointing to where the North Star must have been at that hour, nose and chin were operating alternately it seemed.

However, that's neither here nor there. The fact is that she barely nodded her greetings to the passengers. She boarded the train at the same time I did, and for almost forty-eight hours she traveled on the same car with me, with nary a word to any one. Whither she went, and whyfore none knows—none on that car. It was the second mystery, the first being the spinster's leather bag. And I should rather know the contents of the latter than the details about the former at that.

Two married couples. One of these was strictly housekeeping. The other was strictly non-housekeeping. One regarded her imitation leather suitcase that served as a food chest with much attention and care, throwing out whatever seemed to have lost its freshness, taking care at every important station to purchase this or that thing, but this much I know—her *hors d'oeuvre* was canned soup. She never missed a can—a can never missed a meal. And she made the incisions on the top with practiced fingers—first a tiny hole as a vent and then the larger opening for pouring out the liquid. It was consommé or purée in any event, sluggish or easy-flowing, but she certainly avoided laborious cutting of tin.

Of course, it is not a pastime, that of light housekeeping on a railroad car traveling at forty miles an hour for days, taking curves at high speed and imperiling these Lucullian feasts as they tremble or slide along the polished table top, but it is a convenience, and a great convenience to the family group that must travel on a limited allowance.

Nor is it solely a question of expenditure. In the case of Pa and Ma Dobbs, to whom a hundred dollars more or less would have been of little consequence, there entered the element of adherence to ancient and beloved standards—the kind that could not be abandoned or forsaken for even four or five days on the road. Pa would not have suffered had he been obliged to partake of diner meals, and as for Ma, it would have saved her some work, but they were much more contented by prolonging their "home life" even on the train that the railway company lost nothing by catering to their wants.

In the course of my one experience I believe that my fellow passengers represented about every class and type of everyday, garden variety of citizen, poor and well-to-do, easy to please and difficult to please. But if their housekeeping is any criterion—and I don't see how it could help being—then their domestic success is inevitable. And the best part of it is the self-unconsciousness of it; it is a recognized feature of Canadian railroading and no more to be fussy over than that of disrobing behind green curtains.

Canada has been obliged to study the needs of her traveling public far more than has been the case in the United States. Canada has one mile of railway for every 236 of population, in comparison to the United States which has one mile for every 404 of population, or to England's mile for every 1,804 of population. In order to make railroading profitable under the circumstances the system must be elastic and, above all, discretionary.

The tourist kitchenette-sleeper meets quite a want, and the proof of it lies in the fact that such cars are well patronized, nor is it always a sign of compulsory economy. In most cases it is a sign of independence and self-service. There is no false pride. The patron of the diner does not presume to look askance at the couple that partake of their own cooking. It is their privilege as well as their right. It is a fundamental part of Canadian life—and Canadian life is yet tinged with a nomadic temperament.

But recognizing that there are classes that wish to travel even cheaper or with less fuss—camping parties rather than picknicking parties—there is what is known as the colonist car, which is available to all holders of colonist tickets (whose cost is about half the regular fare) without extra charge.

The colonist car fulfills the needs for which it has been intended. On our American trains, for instance, it is a common enough sight to see passengers, men and women, sit up half or all night in a cramped position on what are known as coaches, satirically dubbed "first-class," and I can conceive of something better than sit up that way. I know, because I have tried it on European trains—such as the first-class and in a way luxurious French P. L. M. coaches—but soft as the cushions are the colonist Canadian car, with its berths, so to speak, that enable one to recline even though there is no bedding, would be preferable, especially since bedding can be easily obtained.

Lumberjacks, crews of outdoor workers, construction gangs, fortune seekers who are oblivious of physical discomforts, men who can sleep on marble slabs with the same ease that they can recline on hair mattresses, and a host of others attest to the popularity and necessity of the colonist car, whose presence on most important long-distance trains is a feature of Canadian travel.

In other words, the transportation idea in Canada seems to be to cater to all the people to the extent of their individual requirements, and that is more than is done in the United States, where in certain cases travel is prohibitively high without corresponding facilities. On the American transportation basis the traveler must act and appear prosperous even when he is not.

Is it not better, after all, to provide facilities for inexpensive travel—when the majority of the traveling public moves out of necessity and not for the sake of pleasure?

Blind Faith in Present Monetary System Dangerous

AN INTERESTING discussion of the Money Question occurred recently in a group of citizens, each of whom had attained a fair success in life, as measured in material competence, or was well on the way to such success.

Theories of finance had been treated pro and con, until the matter of gold contracts was touched upon. The dean of the party, whose success had been greatest of all, though reached through many vicissitudes, expressed confidence in existing conditions, and quietly gave his reasons.

"For my part I know the gold contract means little. I recently sent my check in payment for an obligation specifically providing for gold coin payment. I hold in full satisfaction a written acknowledgment of its receipt and acceptance, as well as the canceled check as evidence of payment. No gold was used in the transaction.

"On the other hand, I am a creditor on paper specifying gold coin as a basis of contract, but invariably accept payments of interest and principal in lawful paper money. To me this is evidence of the soundness of our present system, and I am unwilling to consider any change."

A second member of the group, known to be an opponent of the entire plan of a commodity-based currency and a believer in the overthrow of delegated power to issue currency at all, was challenged to reply.

"There is no question of facts as stated," he said. "The trouble is with those who hold such views; they are simply drifting along smooth waters that may at any moment develop into a rapids leading to a cataract, from which, once entered, there is no escape. Back of every national paper note is the pledge of the faith and credit of the United States, blind faith in which has misled the people to do business with the so-called lawful money, while the usurers have gathered to themselves all of the currency that is a first lien on the gold supply.

"The Federal Reserve System has permitted the concentration of more than half the world supply of monetary gold under its own control, creating a monopoly in that commodity that menaces the power of the government to redeem its pledge, if that becomes necessary.

"Personal responsibility aids in this facility of exchange, for the checks referred to assume the function of money, of which, in spite of the excess in volume of promises to pay over the aggregate gold supply, that volume represents but five per cent of the business exchanges of the country.

"The instance of the Ohio manufacturer who exported his product to Canada during the period when the railroads demanded prepayment of freight because the Dominion currency was at a discount in exchange, illustrates this. He gave his note for the amount of the freight, depositing it with his bank as a checking account. He gave his check for the freight, added the amount to his sight draft on the customer, received New York exchange for the whole in time to pay the note, and not a dollar left the bank. His only cash outlay was twelve cents for a revenue stamp placed on the note. Even the interest was prepaid by check on his private account.

"The contention of reformers is that the government should issue its currency direct upon what is now the real basis of money, the faith and credit of the nation, and that but one kind of currency be issued; that the farmer, the manufacturer, the wage-earner, and the banker shall each receive exactly the same dollar (not, as now, different dollars of different security) and that the power to corner gold by its holders shall be destroyed."

The gold contract is against public policy. It is giving the creditor power to exact something that does not exist. Read it. It is an agreement to pay "in United States gold coin of present standard weight and fineness"; not in gold bullion, not in fine gold, not in assayed quartz, but in "gold coin." Gold is not minted on government account. The holder alone can dictate as to how much may be coined. He can melt down existing coin at will. No man knows today the exact aggregate of gold coins of the United States.

Is not the danger plain? Is the Money Power which exacted from Austria a promise to pay, beside usurious interest, a dollar for every eighty cents borrowed, likely to spare America when the time comes it deems such action wise?

First Impressions of the Picturesque Orient

Concluded from page 9

must have a native guide, unless one has a very good working knowledge of the Chinese language. Until 1921 a great wall completely surrounded the city, and outside the wall was a moat. Two years ago both were done away with and in their place broad avenues of sorts have sprung into being and even the native city itself, dirty and filthy and unsanitary as it is today, has taken on some semblance of cleaning up and improvement over the old order.

In our grandmother's day to own a tea set of willow pattern china was the good housewife's ambition. The original Woo Sing Dong-Willow tea house, which was depicted in blue on that precious china, stands in the native city today in a pond of dirty, green, slime-covered water. The approach to the tea house is by zigzag bridges. You will miss the unpleasant odor—and that is a good thing to miss in China. There are worse things that could happen to a white man in China than to lose his sense of smell.

The angles in the bridge approach to the Willow tea house in the native city have great significance, as the Chinese believe they cannot be traversed by evil spirits, for if one should attempt it he could be precipitated into the slimy water below, where he would surely drown. The place to buy jewels is in the native city, in the thieves market. The thieves market is an actuality, and not merely a name. It operates year after year, never seriously molested by local police or government officials.

Captain Carnaghan of the Poyang, with as rich a burr as ever emigrated from Bonnie Scotland, entertained us all the day after we started up the river with stories of bandit attacks that had been made on his boat in the few months just passed. He also showed us a copy of a certain Shanghai paper of the day before, in which was told in a dispatch from Wuhu that bandits in large numbers had marched within twelve miles of the city and were encamped there, awaiting the word to march on the town. There were several hundred, it said, and the attack was hourly expected.

And in Wuhu we had expected to make our home for the ensuing eighteen months!

We landed at what seemed a peaceful and quiet little port; 300,000 Chinese, and 120 foreigners, including children and missionaries, is Wuhu's population. The sun shone brightly, flooding the hills that are Wuhu's one claim to beauty. Wuhu, once the terror of the treaty port towns of China, seemed as calm as Main Street in Gopher Prairie and about as muddy. Darkness came, and before I went to bed I looked into every nook and corner for the bandit that the Shanghai newspaper said was about to descend upon Wuhu, but nary a bandit did I see. He had been detained! I involuntarily lay awake to wait for him. Listening, I heard wonks barking down in the native villages, and heard the answering call of wonk to wonk mate from the hills. Occasionally, there would be the sound of bunches of little red firecrackers exploding—being shot off in some native home to welcome the new-born son, or to challenge the passing of a soul. In the distant village I heard the click click of bone on bone as the night watchman made his way about the streets and sounded the warning of his approach. My little traveling clock pointed to four and no bandits, armed to the teeth, had as yet descended upon me. Wuhu slept.

I, too, must have slept, but suddenly I was awakened by the most fiendish shriek, the kind known at home as the siren whistle and greatly affected by small town fire departments to sound fire alarms. Shriek after shriek it emitted.

Till break of day I lay, stiff with fright, in my wide and comfortable bed. That day I learned that the whistle I heard would blow every morning at 4:30 o'clock, to notify the many hundred Chinese employes of a local factory that it was time to change to the day shift.

About the story in the China *Press* that bandits were about to march on Wuhu—were within twelve miles of the city gates, in fact—according to the British Commissioner of Customs, it is only a bit of political propaganda.

The Sun's Rays and Plant Life

THE mystery of life is closely interwoven with the mystery of light. The transformation of inorganic substances into organic and living protoplasm is the most marvelous and important process in nature. At the initial end of this series of changes we find light as the potent principle. Light, therefore, is the greatest of all the cosmic transformers. One may say that the Creator's mandate, "Let there be light," was equivalent to the command, "Let there be life."

The process by which light rays' transform inorganic matter into organic substance is called *"photosynthesis"*; and this word literally means, *"combining by the agency of light."* Although *"photosynthology"* is a comparatively new science, some elementary facts in this interesting field of research were known in the latter part of the seventeenth century. In the year 1774 Priestley observed that air, which was not suited to sustain animal life, had its life-supporting properties restored when green plants were permitted to remain in it for a considerable period of time. Now we know that Priestley was describing air whose oxygen content was low and which, undoubtedly, contained an excessively high percentage of carbon dioxide. When the green plants were introduced into this type of atmosphere something happened which increased the percentage of oxygen because this element is essential to the support of animal life. The conclusion that plants act as chemical transformers is inevitable. It is now a well-established fact that plants manufacture starch which is later digested or transformed into sugar. It is during the process of manufacturing starch that plants liberate oxygen into the air. The chemical elements which compose starch are carbon, hydrogen, and oxygen. These elements must be combined in definite proportions, however, to form this particular substance. Chemical analysis has shown that starch is composed of six parts of carbon, ten parts of hydrogen, and five parts of oxygen. The plant gathers this raw material from the air where these required elements exist in the form of carbon dioxide and water. Carbon dioxide is composed of one part of carbon and two parts of oxygen. Water is composed of two parts of hydrogen and one part of oxygen. The only simple combination that will supply enough carbon, hydrogen and oxygen to produce starch is six parts of carbon dioxide and five parts of water which is equivalent to six parts of carbon, ten parts of hydrogen and seventeen parts of oxygen. Starch, however, requires only five parts of oxygen out of this supply. The excess, consisting of twelve parts of oxygen, is liberated into the air by the starch manufacturing plant.

This explains the purely chemical part of the process. The remarkable factor in the transformation, however, is the rôle played by light rays in the manufacture of the starch. It is the light rays, through their mysterious activity, that bring about the union of carbon dioxide and water, producing starch and liberating oxygen. Another chemical change is brought about by the activity of plants. After starch has been produced by the aid of rays of light and chemical action this compound, through the addition of water, is transformed into sugar (*glucose*).

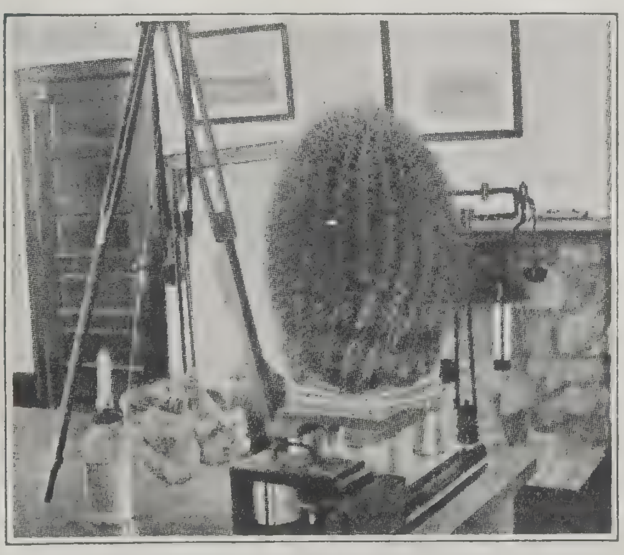
Desert Laboratory at Tucson, Arizona.

From the cosmic standpoint *photosynthesis* is one of the most important processes in nature. By this process enormous quantities of carbon have been stored in plants and trees. Coal is one of man's greatest sources of energy. It is a well-known fact that coal is of vegetable origin. When submerged under water, plant and vegetable matter is gradually changed into carbon. During the process of decomposition, under water, vegetable matter slowly gives off oxygen, hydrogen, nitrogen and comparatively small quantities of carbon. The great residue, from carboniferous times, consists mostly of coal containing an abundance of carbon and other substances which may be disengaged in gaseous forms and condensed into valuable by-products.

The process by which carbon is stored in plants and trees is colossal in magnitude. The following facts clearly prove the truth of this statement. A tree weighing about five tons (dry weight) contains about two and one-half tons of carbon. The quantity of carbon dioxide contained in 10,000 quarts of air is about four to five grams and the carbon content in this amount is about two grams. On this basis it can be easily shown that 12,700,588,000 quarts of air are required to furnish the two and one-half tons of carbon in the tree.

In the observation of Priestley we discover one of the most marvelous of nature's cycles—the interdependence of animal and plant life. Carbon dioxide is expelled by the lungs of human beings and animals. This carbon dioxide is finally transformed, by plants, into living protoplasm which is available as food for man and animals. The atom of carbon leaves the animal in the form of carbon dioxide and returns as food. Those who maintain that such wonderful natural processes are the result of mere chance must be the victims of irrational delusions.

Measuring the growth of a tree by the dendograph and the dendrometer.



Determining the weight of barrel cactus deprived of water for two years.

Photosynthesis operates through an ingenious organic device called the *"chloroplast."* This consists of minute flattened granules which develop only in those plant cells which are exposed to light. The *chloroplast* contains the coloring matter or pigment called *"chlorophyll"* which is the great essential in the production of such carbohydrates as starch by the photosynthetic process. Professor R. Willstätter's extensive researches (1913) have added much to our knowledge of the remarkable substance, *chlorophyll.* It is a very complex nitrogenous substance containing both green and yellow pigments. This substance is found in the *chloroplast* granules of the leaves of plants and trees. Chlorophyll occurs upon or near the surface of these granules. The exact process by which chlorophyll transforms carbon dioxide and water into starch is unknown. When the nature of this process has been discovered then one of the greatest mysteries of the universe will have been solved. We do know, however, that chlorophyll absorbs certain light rays, principally those corresponding to the wave-lengths found in the red part of the spectrum, and this absorbed vibratory energy of light is changed into the chemical energy which is required to combine the carbon dioxide, furnished by the air, with the water, which travels upward from the roots, into the carbohydrate starch. The process of absorption of vibratory energy by chlorophyll may be of a "sympathetic" nature. The vibration rates of the molecules of chlorophyll may be the same as the excitant light vibrations. Photosynthetic transfer of energy would then be due to the ability of light rays to cause the molecules of chlorophyll to vibrate sympathetically after the manner of two piano strings of the same gauge and length. This theory is the only one so far advanced which has gained the support of specialists in this obscure field of scientific research.

In nature the sun's rays are the principal source of this vibratory energy. Artificial light, however, is also effective in producing the same type of results in proportion to the available energy. In many countries horticultural experiments, using electric light, have shown that the development of the foliage and vegetative organs of various plants may be forced, to a certain degree, by this agency.

The Department of Botanical Research of the Carnegie Institution of Washington has had its headquarters in the Desert Laboratory of Tucson, Arizona, since 1905. We are indebted to a recent departmental report for the illustrations which accompany this article.

The problem of photosynthesis is one of the many within the scope of this department. An instrument called a "dendograph" has been developed for the "measurement of the course of change in volume of tree-trunks." The change in the circumference of a tree is measured by a "dendrometer." The work of this department is of exceptional practical significance.

URBANA ILL

BRIEFLY TOLD

There are boys and girls in certain sections of Ohio, and even men and women, who have never seen a "movie" show, according to reports from county agents in these remote districts.

It is the custom each year to present a silk hat to the skipper of the first grain-carrying boat to enter the port at Fort William, Ontario.

More than $6,126,000 worth of rice was produced in California in 1923, most of which was sold in Japan.

Persia will develop her railroad system by building new and needed roads, financing the work by selling the crown diamonds.

The German Department of Labor reports a remarkable revival of household manufacturing during the present period of economic distress. Spinning wheels, hand-operated linen factories and other home devices are being pressed into service.

In Spitzbergen the carcass of an animal can lie in the open for a couple of years and show no signs of decomposition.

The largest bridge in the world will be built over the estuary of the River Elorn in France to connect Brest with Plogastel. It will be six miles long and made up of two approaches, one-third of a mile long, and four spans of one and one-third miles each.

Regardless of the fact that the earthquake in Japan destroyed the warehouses, shippers have continued to consign merchandise to Yokohama and Tokio owing to the demand for goods. This merchandise is being landed and stored in the open, and steamship companies have issued an announcement to the effect that they can assume no responsibility for goods after discharge from steamer. At this writing there are more than 120 vessels discharging or waiting to discharge at Yokohama.

A proposal has been made to change the name of Manhattan Square in New York City to Roosevelt Square and the proposal contains the suggestion that space in that square be reserved for a Roosevelt memorial.

King George has installed in his palace a radio receiving set with two stages of radio frequency amplification and three stages of audio amplification. The British Broadcasting Company plans to broadcast the song of the nightingale in its native haunts this spring.

Prior to 1912 there was not a single labor organization in Japan; today there are nearly seven hundred unions with a total membership of a quarter of a million.

The State of New York has 9,000 more students in colleges and universities than the entire United Kingdom.

Many Icelanders have never seen a train nor a trolley car, a drama nor a masterpiece of art; nor have they ever seen a tree; only saplings in some very sheltered nook. They have no gardens, fruit or grapevines.

"The International Jew," a four-volume series on the Jewish Question, may be obtained from The Dearborn Publishing Company, Dearborn, Michigan. This set includes:

"The International Jew," Vol. I, 235 pages; "Jewish Activities in the United States," Vol. II, 256 pages; "Jewish Influence on American Life," Vol. III, 256 pages; "Aspects of Jewish Power in the United States," Vol. IV, 246 pages. The price of these volumes is twenty-five cents each; the complete set, four volumes, one dollar.

BINDERS

Readers who desire to save their copies of The Dearborn Independent can now obtain a specially constructed cloth covered post binder. This binder is very practical, holds 52 issues and permits immediate reference to or removal of any copy without disturbing any other issues. Price $2 each delivered. Remittance must accompany orders.

Oliver Wendell Holmes, Associate Justice of the United States Supreme Court and the son of Dr. Oliver Wendell Holmes, the famous poet and essayist, has been awarded the Gold Medal of the Roosevelt Memorial Association for distinguished service in the development of public law.

Old pioneers of the western towns are complaining that the film producers are not sticking to historical facts in many of their pictures taken on the old stamping grounds of the heroes of the plays. They contend that writing or picturing events without the aid of the men who lived through the times in which the stories are given tends to give a crooked slant to history.

French theater managers will allow critics to have their say only after theater patrons have manifested their sentiment, instead of inviting the critics to the first night's performance. The critics will receive their invitations for the third or fourth performance.

A Federal agent in New York City recently upset by accident a can of alleged Turkish paste in the appraiser's storehouse, revealing opium hidden under the paste. This led to the seizure of between $60,000 and $100,000 worth of the drug hidden in other tins consigned to Abraham D. Lake, radio merchant.

Gizzard stones from dinosaurs have been found by a scientist connected with the United States Geological Survey. They are of quartz and agate, varying from less than an inch to more than three inches in diameter. They are entirely foreign to the geological formation in which they are found in the oil-sands of Wyoming. They were found among dinosaur skeletons.

Water buffalo, imported into Italy from Africa by the Carthaginians under Hannibal about 200 B. C., perform their greatest service during their hours of leisure when disporting in the marshes. It is then they rid the irrigation and drainage canals of clogging aquatic plants, which they uproot with their sharp hoofs.

Tampico is the world's greatest oil port. Often nine million barrels of oil are shipped from there in a month.

The Netherlands back from the sea is not a flat land of dikes and ditches, as many believe, but a wooded, rolling country, abounding in old castles reminiscent of robber barons and heroes of historic days.

Marino House, Clontarf, Dublin, the old historic residence of the earls of Charlemont, is about to be demolished to make way for fifteen hundred workmen's houses.

Huston Thompson, member of the Federal Trade Commission, in a recent address, suggested measures for coping with what he described as the increasing "machinations of lobbyists in Washington," including their compulsory registration with a government agency.

After a survey of the premises of a farmer in Virginia it was found that the housewife, to obtain water for her work, was walking 140 miles a year and expending enough energy to do the work of two horses in plowing eleven acres of land. A small hydraulic ram, overhead storage tank, kitchen sink, and waste pipe were installed at a cost of about fifty dollars, which put running water into the kitchen.

The geophone, a small seismograph-like instrument, is so sensitive that in the quiet of a mine, sledge-pounding has been heard through about 3,000 feet of solid rock. Talking has been detected through a fifty-foot coal pillar.

Senator Curtis, of Kansas, it is said, had the Senate all to himself recently. When the gavel fell, calling the Senate to order, he was the only member on the floor, all the others being away, many of them attending investigating committees as witnesses or onlookers. It was fifteen minutes, according to reports, before enough Senators could be called together to form a quorum.

The Harvard University library received a gift of a rare volume in honor of the ninetieth birthday of Charles W. Eliot, President Emeritus. This book is Heylyn's "Cosmographie Containing the Chorographie and Historie of the Whole World," second edition, printed in London in 1657. John Eliot, apostle to the Indians of Massachusetts, at one time owned the volume and it bears his autograph and marginal notes written by him.

Prominent conservationists and agricultural officials of Massachusetts have protested to the Du Pont Powder Company against its proposed nation-wide crow-shooting contest. They believe that crows should be reduced when they become destructive, but that a nation-wide extermination campaign would result in more or less slaughter among nesting game and song birds and add to the fire risk in the forests.

CHRONICLER OF THE NEGLECTED TRUTH

Was Hugo Stinnes a Jew?—He Always Said No

German Industrial Leader Once Discussed the Semitic Question in Plain Terms and Gave His View of Its Ultimate World Solution

By JACOB ISAACSON

Was Hugo Stinnes a Jew? Certain American periodicals have assumed from his photographs that he was, and since his death the Associated Press has referred to him as descended from "an eminent Jewish family." The question of Mr. Stinnes' racial descent was at one time of sufficient importance to warrant inquiry, the result of which has never before been published. As a matter of public interest, and as giving a view of Stinnes personally, such as is not to be found in the mass of writing which has attempted to describe him, the article, part of which is here published for the first time, may be of permanent value. It was written in 1920-21.

HUGO STINNES was born in Mülheim, son of the junior chief in the firm founded by his grandfather, Mathias Stinnes. This firm, which dates from 1870, became very quickly one of the very richest and most influential of those coal-mining and coal-trading firms which at that time grew up in the Ruhr district, and out of which the heavy industrial undertakings in that district later developed.

It was these firms which first attempted to unite coal-mining, coal-dealing and coal-transportation and in this manner became the pioneer of the mixed or, as it is also called, closed industry (Trusts). Hugo Stinnes' grandfather and father had, in connection with their coal mines in the Ruhr, also their own line of river ships which handled the distribution of coal to South Germany and to Holland. The natural quest for freight for the return trips of these ships, together with the need of reliable and steady buyers for the coal, soon led to partnerships in other firms, both German and foreign.

Master of the "Vertical Trust"

HUGO STINNES was, then, the son of a relatively rich family, whose business development was founded on their own wealth. He acquired, through his own work, practical knowledge in mining, and later attended the mining academy in Clausthal. After that, he took his place in the management of the family business which, however, did not long satisfy his desire for enterprise and business on a large scale. In the first year of this century began the building of the Hugo Stinnes group, at that time perhaps best known by the part it played in the foundation and development of the Mülheimer Bergwerks-Verein (Mining Association).

During this period of Stinnes development, two things are typical of him and have often found expression in public; namely, first, the outspoken predilection for a quiet but nevertheless foresighted mode of working. All the larger transactions were always thoroughly planned beforehand and secured in each step of their development. Also the general evolution of the group was planned and mapped out years beforehand, so that the public often received a sudden and unexpected surprise in hearing of new large operations of the Stinnes group.

The other peculiarity which came to expression in the Stinnes operations, in opposition to all other industrial and banking groups, was the fact that the Stinnes group never lost sight of their extraordinarily large and ambitious goal. This was shown by the fact that Stinnes steadily bought more and more mining and industrial enterprises without afterward letting these works earn any interest; he simply wrote off all the earnings and undertook new investments.

Stinnes worked slowly and more or less secretly, so for years the general plan of these operations was not evident to the public. Several times this immense industrial structure was on the verge of collapse, because even the enormous fortune of Stinnes and his family was not nearly sufficient for the realization of plans of this magnitude, and it is debatable if they ever would have been realized had it not been for the war.

That Stinnes should become a factor in national politics, either directly or through the men that surround him, had before the war never been thought of. His first appearance on the political stage was during the war, when he acted as member and expert in the different commissions that dealt with the organization and operation of the industrial works situated in the Allied territory occupied by Germany.

Meeting Stinnes at the Adlon

MR. ———— and I were received by Mr. Stinnes in his rooms in the Adlon Hotel, Berlin, Thursday, January 27. Stinnes is a man of fifty, very dark, wears a full beard and the darkness of his hair and eyes is emphasized by the remarkable paleness of his skin.

His whole appearance gives evidence of a tired man who is addicted to working incessantly within four walls, and who seldom gets exercise in the open air.

As he talked he leaned back in a large armchair, and one could see that he had developed the habit of saving his energy. His voice never rose to much more than a whisper even when he wanted to give weight to a statement.

Present besides Mr. Stinnes, Mr. ———— and myself was a private secretary, who made a stenographic record of the conversation.

Mr. ———— said to Stinnes: "You look tired."

Mr. Stinnes answered, "Yes, I worked until five o'clock this morning and started again at eight; that is the way it goes every day. I seldom get more than three or four hours sleep."

I asked Mr. Stinnes if he had ever heard that it was generally believed in America that he was a Jew, due to articles published in magazines and newspapers, and also due to his widely published photograph.

Stinnes Discusses Facial Appearance

HE laughed and said: "That may be due to my appearance. In the first place I am dark; in the second place I had an accident as a boy and broke my nose—since then it has been somewhat hooked. But the blood in my family has been pure German as far back as I can trace it, and we are of the Protestant faith. However, it is just likely that the French and English are interested in discrediting me with the American Gentile public, after the affair in Spa last year, and therefore are spreading the information in America that I am a Jew."

A close scrutiny of Stinnes' face does not reveal any of the characteristics of Semitic blood, neither around the mouth, nor in the eyes.

To my surprise he seemed to be equally as interested in agriculture as in industry, and he certainly was well versed in farming methods. He explained his extensive experiments in fertilizing his own farms in Germany with clover and lupine which he (just as we do) lets grow a certain length of time and then plows it under. He believes that the lupine is the best fertilizing plant known, due to its large nitrogen content.

I asked Stinnes what he thought of the cry raised by German manufacturers against the entrance of other manufacturers into the country. He said that, according to his idea, it was most desirable that the industries of the various nations remain in the hands of their own nationals, but on the other hand Germany was at the present time in such an impoverished state that it could never extricate itself without American help—especially in the regeneration of the industries. He also said that he realized that this help would never have been obtained without the German industries becoming partly Americanized and partly American-owned.

We then reverted to the Jewish Question and I asked Stinnes if he thought there was any connection between Bolshevism and the Jews. He answered that there was.

I asked him if he felt that THE DEARBORN INDEPENDENT was also fighting Bolshevism when it exposed the activity of the International Jew. He answered: "Yes, absolutely."

I wish to call your attention in this connection to the fact that Stinnes has made an appropriation of one hundred million marks to combat Bolshevism.

Stinnes added that he thought there was a conscious organized effort on the part of some of the big international Jews to attempt the financial rule of the world.

"But," he said, "I am afraid it is too late to do anything about it in a direct, combative way; their hold is too strong by this time."

I asked what ways he would suggest for the Gentile world to meet the menace which the increasing power of the Jews constituted. He answered by explaining to me his program of "Antisemitismus der besseren Leistung"—(the anti-Semitism of doing better than the Jews) which he has preached at many public occasions and which is well known in Germany.

It consists simply in teaching Gentiles to work for quality results and to do business on straight lines. Shoddy goods and tricky dealing are not natural to the northern white race and they cannot compete in them with Orientals to whom they are natural. This is "the anti-Semitism of doing better than the Jews."

In the succeeding lines I shall try to point out what Stinnes really would seem to be if one scratches the surface.

How Far Was He "Used" by the Jews?

THERE is *no doubt in my mind about Stinnes' Gentile birth.* One does not have to take his own word for that; the best genealogical experts in Germany will testify to the truth thereof; but let us go a little further. Here we have this man as he stands today—a colossal figure in the industrial, political and economical life of Germany—the creator of the largest trust the world has ever seen. The fact that it is "vertical" and embraces all lines of industry from mining up, makes no difference. According to his own admission it is patterned after the Jewish style. This insatiable ambition and its ultimate triumph would not constitute such an enormous danger to the world if Stinnes were Stinnes—and nothing more:—But is he?

Among his immediate lieutenants there are no Jews—but the minute one starts to investigate the banks with which he has done business, the fact that the administration of these banks is Jewish cannot escape one's attention.

But the German Jewish banks with whom Stinnes does business are hardly large enough to own him. The unnamed corporation is indeed Dutch, but its activity in connection with Stinnes does not limit itself to engineering oil trusts with him. This syndicate of Dutch Jews are financing Stinnes in the most important of his combining operations since the war. These combinations are so wide-reaching that should the capital necessary to keep them going fail to materialize, Stinnes would be wiped out. In other words this syndicate of Jews having their headquarters in Holland at present *own Stinnes,* and therewith he automatically becomes their *"Gentile front,"* the most enormous Gentile front in the history of Jewry, but withal a Gentile front.

This Is All Settled Now

THAT Stinnes should have consented to be made a Gentile front with open eyes I do not believe, but his limitless personal ambition has driven him on and on until he had to play into the hands of the Jews or cave in—he apparently chose what to his mind was the lesser of the two evils. That the date of this Jewish gobbling up of Stinnes is a comparatively recent one can also be considered certain.

Where he will end is difficult to predict but my own earnest belief is that if the Jewish scheme works around to its final destiny as outlined in the Protocols, Stinnes' head will be one of the first to fall. The other possible alternative: That Stinnes should be taken into the inner conclave of the Jews, and continue to do business as one of their own indefinitely, I consider a very remote possibility, for the simple reason that Stinnes is a far too dangerous man for the Jews to fool with. There is namely every evidence to show that Stinnes will fight the Jews the minute he is independent of them. The idea that his abovementioned program of "Anti-Semitism of doing better than the Jews" should offer a solution to the problem is, of course, both insincere and utopian; and the fact that he hands it out to the public only offers another evidence that he is afraid of the Jews.

So, in view of this, there seems to be only one thing to expect, and that is that the Jews will squeeze him the minute they feel that they can do so with impunity, which means take over the colossal Supertrust built up by Stinnes and administrate it to suit their own needs and serve their own purposes.

Festival Held in Honor of Georgia Peach

Pageant Links the China of 2,000 B. C. With the Georgia of Today

By CLAIRE GILES

HISTORY cannot be made in a day, but one day's happenings can establish a precedent that will echo down the years with a recurrence that establishes its permanence for all time. Such an incident was the Peach Festival held at Fort Valley, Georgia, in March, 1922, and repeated every spring since. This was America's first really and truly native festival.

Festivals date from the dawn of history. Every country, with the possible exception of Persia, whose people have no temples and no common form of worship, has its festivals. These are either religious, pagan, or materialistic, according to the prevailing beliefs of the people. In some countries they have taken on more the color of feasts; in others, human sacrifice, and the Greek idea was a sort of joyful pageant in honor of the harvest or the vintage. Even now Japan has her cherry blossom carnival, Norway celebrates apple blossom time, and Holland, tulip time.

In America our few carnivals and festivals—among which are our rose carnival in Portland, Oregon, Mardi Gras at New Orleans, and Gasparilla Day at Tampa—are perpetuated by the descendants of other races. It is not strange that we should have no American festivals; first, because our country is yet young, and it takes centuries to grow traditions; second, because in early pioneer days the struggle for a bare existence precluded a lively play of the imagination, and in latter years commercialism and the strain of keeping garmented a country that, like a fast-growing boy, is always in danger of outgrowing his "britches," has left little room for sentiment or the spirit of play. Our nearest approach to the festival idea was carried out first in the custom of having "house raisings," later in quilting bees and husking bees (called "corn shuckings" in the South), all of which combined a hard day's work with feasting and dancing and merrymaking.

And now it seems that we have graduated into the ancient custom of combining our harvest celebration with pageantry.

There could not have been a happier inspiration than that our first native festival should be woven around the peach, and that its setting should be in a blossoming peach orchard. No one person, it seems, was responsible for the movement or is willing to take credit for the idea, since it seemed to occur to nearly everybody in Fort Valley at the same time. The Community Service Organization took hold of the movement, the Kiwanis Club sponsored it, and literally everybody did his or her part toward making the festival a success. It is told that a traveling man, happening into Fort Valley (which is a town of about 4,000 inhabitants) while the festival was on, asked: "Who got it up anyway?" For answer he was shown the telephone directory of the town.

The whole thought behind the festival was to interpret the spirit of joyousness with which the growers greet the awakening of spring and the bursting into bloom of the acres of peach trees which mean the very life and happiness of the people in that section of Georgia. This was done by combining a pageant with a feast—which means, in Georgia, a barbecue. A pageant play was selected, a king and queen of the carnival were chosen, and the Governor of Georgia and many notables were invited to attend.

Twelve thousand persons came to "The Peach Paradise of the World" to the first festival. All night long the night before, one hundred men attended the barbecue pits where twelve hundred pounds of meat was being prepared, and Negroes kept live coals under one hundred and fifty roasting pigs and ten roasting cows. There were three hundred and fifty gallons of Brunswick stew served, five hundred gallons of coffee, three thousand loaves of bread, three barrels of pickles, and many bottles of soft drinks. More than ten thousand plates were served to white people and two thousand to Negroes. Three hundred women superintended the dinner.

When the feast was over, the pageant began. The masque portrayed a bit of Georgia woodland. In the background, behind the throne of the king and queen, were acres of blossoming trees—a sea of pastel pink as far as the eye could reach, and down endless vistas thousands of lovely, fluffy blossoms. There was something ethereal in the spectacle. In the foreground were the court musicians, the lovely ladies in waiting, dainty flower girls, pages and courtiers. There was a chorus of several hundred voices, and music was furnished by two bands.

Then unfolded the allegorical pageant, which typified the anger of the Sun Goddess, the methods used by the Rice Maidens, the Cherry Blossom Maidens, Wisteria Maidens, and the Goddess of the Orchard to lure the lovely Sun Goddess from her cave. When it seemed as though the lovely, graceful dances of the maidens would prove unavailing, the goddess finally made her appearance from amid a shower of peach blossoms, and her advance was widely heralded as the omen that spring was at hand and that a prosperous season awaited the planter. The most beautiful girls of Fort Valley were chosen to enact the different rôles, and their daintiness, charm and grace lent much to the exposition of the theme.

Thirty thousand guests attended last year's festival, and 238 hogs, ten beeves and ten sheep were prepared. The pits in which the meat was barbecued were half a mile long, and seven miles of tables were required to serve the guests. "Last year," said the enthusiastic president of the Fort Valley Kiwanis Club, "we invited the United States and Canada. This year we extended a cordial invitation to the *whole world* to come to Fort Valley to the Peach Festival." Preparations were made to entertain 50,000 persons. Since last year, Fort Valley streets have been paved, a white way has been erected, and other civic improvements effected. In the 1923 pageant, 1,000 persons—all local talent—took part. This year the festival was even more spectacular, depicting the history of the peach since its first appearance in China, 2,000 B. C. There are between 10,000 and 12,000 peach trees in the Fort Valley community alone, and the festival is held when they are in full bloom.

Above—Grand ensemble Fort Valley Peach Festival and Carnival. Oval—Scene from 1923 Peach Festival at Fort Valley, Georgia.

The peach, which strangely enough belongs to the rose family, is native to Asia, its supremacy as a Western product being due to improved methods of culture and adaptability of soil and climate. There were 8,000,000 bearing peach trees in Georgia in 1921, and 3,391,851 trees not of bearing age—which means trees under three years of age. The number of bearing trees has almost doubled since then, and Georgia's peach crop represents an annual revenue of nearly $10,000,000, and gives employment to thousands of people, particularly during the picking, packing and shipping season, which is from the middle of May to the last of July. In 1922 there were 10,000 cars of peaches shipped from Georgia, of which sixty-five per cent went to eastern markets. Last year the crop was short, due to torrential rains during the blooming season (which washed the pollen out of many of the blooms), and this season promises between 12,000 and 15,000 cars.

Georgia's Elberta peach is widely known and highly favored, being probably more sought after than any other peach. It resulted, about twenty-five years ago, from the experiments of Mr. Samuel H. Rumph, a nurseryman living in Marshallville, Georgia, and is a cross between the Chinese Cling and the Crawford Early. It was named for his wife.

In the efforts of the growers and nurserymen to find an early peach, they have at last hit upon such early varieties as the Mayflower and the Uneeda. In 1921, the first car of peaches was shipped on May sixth, which is the earliest date on which a shipment was ever made. These early varieties have not proved as satisfactory, however, as the growers had hoped, since, being a forced growth and really out of season, they lack the flavor and "comeback" of the more staple varieties. These varieties come along in the order named: the Carmen, the Hiley (sometimes called the Hiley Belle, and named for a Mr. Hiley, of Fort Valley, who perfected the peach), the Belle of Georgia, and lastly, the Elberta, which is by far the most popular and the most extensively shipped.

In many respects the Georgia peach is considered superior to the California peach, the latter being dry and lacking the juiciness of the Georgia peach. For this reason it is essentially a canning peach, and the larger portion of the California peaches go into cans. This is not to say that the Georgia peach is unsuited for canning, for most of the varieties make an excellent canning peach, and canning plants have been established throughout the fruit section, which includes Fort Valley, Marshallville, Byron; and recently one of the best equipped plants of this kind was established at Franklinton, near Macon, Georgia. These canneries afford a ready market for a large per cent of the peach production.

Of all fruits, peaches and strawberries are most perishable, and require the most careful cultivation. Peaches are quite susceptible to all sorts of parasites and diseases. This necessitates eternal vigilance and constant spraying and dusting with chemicals under instructions from the government laboratories, and a United States Bureau of Entomology is maintained at Fort Valley for the benefit of the growers. There is not a month during the year that the trees are not given attention, and the most scrupulous housekeeping is practiced. When you cast your eye over a peach orchard, you see a house "swept and garnished."

Even with the most scrupulous care, peaches are subject to Brown Rot and a disease caused by the sting of an insect called the "curculio." This last is discoverable before the peach is mature, and is shown by tiny, jelly-like drops appearing on the outside of the peach, which means that the peach will harbor a worm.

Brown Rot is a peculiar disease that remains incipient, the defect in the peach often not showing up until after shipment. However, there is protection against these diseases through constant spraying and dusting, and government experts are constantly on the job to see that the peach growers have the advantage of every advance that science and experimentation can make, better to simplify and stabilize peach growing. There has not been a complete failure of this crop in twenty years, though sometimes the crop is considerably curtailed, as in 1923.

There is romance in the harvesting of peaches! They are picked by hand by Negroes in regulation peach baskets with handles, and left in the roadways to be gathered by trucks and taken to the packing shed. Every large plantation has its packing shed, and many of them have "hotels" where the help is housed and fed during the packing season. The packers are all white, and are composed largely of experienced citrus fruit packers who migrate from Florida to the peach section for the summer. Among the packers will often be found school and college students who are earning money for tuition.

The ramifications of the peach industry are almost limitless, literally affecting the lives of thousands of people. The cultivation of the soil (cotton, corn, peas, and so forth, are planted between the trees—which are planted about twenty feet apart—the first two years); the constant spraying, dusting and pruning; the hundreds of tons of fertilizer and chemicals used; the implements required in cultivation; the thousands of extra freight cars, and hundreds of tons of ice used in refrigeration; the extra employes required to handle on the railroads—all these furnish adequate reasons for a peach festival and carnival in Georgia, and cement the determination to make it a national and permanent institution.

Jewish Exploitation of Farmers' Organizations

III. Money for Everybody but the Farmer

By ROBERT MORGAN

IF THE impression has been left by preceding articles that Aaron Sapiro, or the Sapiro plan, is responsible for the co-operative marketing idea or its development, allow me at once to correct that idea. Mr. Sapiro did not originate nor develop co-operation. He simply has taken hold of an existing condition, the development of nearly a century, and is engaged in shaping it to his ends, and to the advantage of the bankers, attorneys, promoters and other exploiters of which he is the mouthpiece.

Mr. Sapiro in his addresses and in his "educational campaign" among the farmers uniformly tells the agriculturists of what "we" have done in California. Since he thus selects California as the scene of his greatest successes in the promotion of the Sapiro plan, and since it is a fact that more farmers, fruit-growers, poultry-raisers and vegetable-producers have been misled into following that plan in California than in any other state, let us turn to the record and see the results of the application of the plan there.

In the first place, neither Aaron Sapiro, nor any of his crowd, have had or now have anything whatever to do with the few co-operative marketing associations which have been markedly successful in California or on the entire Pacific Coast. The California Fruit Growers' Exchange, which handled 27,138 cars of the 43,620 cars of citrus fruits which the co-operatives marketed in 1923, has been in operation for thirty years. Mr. Sapiro never has had the slightest connection with it and has none now. This exchange has 213 local associations (not branches) and marketed $48,647,800 worth of citrus fruits last year.

The California Walnut Growers' Association, which markets about 81.5 per cent of the walnut crop of California, valued at more than $9,000,000 a year, has never had any connection in any way with Mr. Sapiro or his associates, and is operated on a plan and organization altogether different from that offered by the "leader of American agriculturists."

The Sun-Maid Raisin Growers' Association, of Fresno, which has had troubles enough of its own without borrowing any from Sapiro sources, is referred to almost constantly by Sapiro, Rubinow and others engaged in the improvement of the American farmer, as "an outstanding example of the success of *our* co-operatives in California." Yet neither Mr. Sapiro nor any of his associates has ever had the slightest connection with the Sun-Maid Association, any of its district or local organizations, or any of its members.

The California Peach and Fig Growers' Association, with headquarters at Fresno, is another which is frequently referred to by the promoters of the Sapiro plan as an example of the success of that plan. The truth of the matter is that Mr. Sapiro has not now and never has had any connection of any kind with this association.

Going farther north, I find that the Tillamook County Creamery Association—one of the most successful of all dairy co-operatives ever organized—was formed when Sapiro was a small boy, and has been functioning without his aid ever since.

The Apple Growers' Association of the Hood River Valley, Oregon, sometimes pointed out by Sapiro's agents as another shining example of the success of their plan, was organized nearly twelve years ago, with A. W. Stone as organizer and general manager. Mr. Stone is still general manager and has been able to operate the association successfully without a word from the Sapiros or anyone connected with them.

The Fraser Valley Dairies, Limited, of Vancouver, British Columbia, reports that, while successful, it can attribute none of its success to Mr. Sapiro or his organization, since his advice never was asked nor his plan used in any way in any connection with this notably successful co-operative organization.

So this list of those associations in which Sapiro never has had a word to say, but to whose success he "points with pride," could be continued indefinitely without going any farther outside the state of California.

Every stalk of celery shown in this corner of a large field pays direct tribute to Jewish domination of the co-operative marketing system in this section of the United States.

One thing that Mr. Sapiro, Mr. Rubinow and others neglect to mention is that the plan of organization, operation and control of virtually all the successful associations *is fundamentally different from the Sapiro plan.* Co-operative associations organized or reorganized under the Sapiro plan in California, and in other Pacific Coast states as well, are most conspicuous for the disasters which have overtaken them. As we read, we shall see that virtually all these disasters are due to two factors:

Every half a pear shown drying in the California sun belongs in part to the ring which controls the fruit co-operative marketing associations of the deciduous fruit districts of that state.

First, simple, yet fundamental errors in the Sapiro plan itself.

Second, bad management, sometimes bad because of ignorance of the industry, sometimes because of dishonesty on the part of the managers.

The majority of the managers are Gentiles, and all the managers must meet with the approval of Mr. Sapiro, or they do not remain as managers. There is nothing to show that Mr. Sapiro connives with these managers either in their ignorance or their dishonesty, but as a picker of managers, he has little success with regard to the prosperity or the safety of the farmer.

One of the first of the Sapiro plan fiascos was the California Tomato Growers' Association. Sapiro, with the assistance of Mark Grimes, organized this association some six years ago. Both Sapiro and Grimes received their fees for their services, but the unfortunate tomato growers were left holding the sack for approximately $48,000 at the end of the first year. The association never has been revived.

The Fruit Growers of California, a co-operative green-fruit marketing association, with R. P. Van Orden, a close friend of Sapiro's, as president, has found itself under the necessity of immediate reorganization, and the establishment of a new marketing agreement, according to Van Orden's announcement, made at San Jose, California, on January 28, 1924. The Fruit Growers of California was built on the Sapiro plan fully and completely, and it is the latest of the Sapiro-plan associations to go the way the majority of them have gone—into reorganization either to avert or to remedy disaster.

But between the unfortunate tomato growers and their loss of $48,000, including Mr. Sapiro's fees, and the latest movement of the Fruit Growers of California, lies a long list of wreckage.

In Oregon, no more than three years ago, there was a Dairymen's League, which had been working to the satisfaction of its members for some time. They listened to the call of the new era in co-operative marketing, followed the Sapiro will-'o-the-wisp, and, two years ago, were sunk without trace, with heavy individual loss to the members.

Farther north, in Okanagan, British Columbia, there was in existence, until two years ago, the Okanagan United Growers, Ltd., a successful co-operative marketing association, at least its members never had lost any money, and believed they were making more than they would trying to sell individually. Here Sapiro tried his usual scheme of destroying existing methods to make way for his own. The Okanagan growers were lured into the Sapiro plan, the existing organization and its methods were discarded, and the old association forced into bankruptcy. Just as the assignee in bankruptcy was clearing up the last details of this forced dissolution, late in January, 1924, comes the news from Okanagan that every member lost money, some of them large sums of money; that the new Sapiro-plan association is not functioning so well as the old one, and that the growers are not in such good condition in any way as they were under their own association, without Sapiro's assistance.

Sapiro now has agents in Eastern Canada, preparing the ground for the Sapiro plan, and making ready, also, to force to the wall those existing associations over whose members he can obtain control, as he did at Okanagan.

Apparently the Colorado Potato Growers' Exchange has found the Jewish fly in the American amber, for on the Pacific Coast, at the end of January, the newspapers gave space to a dispatch that "Aaron Sapiro, the

Every sack of grain produced in the United States will help to swell the fortunes of those now seeking control and direction of the wheat industry of this country, when the Sapiro plan becomes the method of marketing our grain. Here are barge loads of grain coming down the Sacramento River for shipment to Europe.

apostle of new prosperity for the farmer," had retired from that organization. Almost on the same day, it was further reported that he had quit as counsel for the American Farm Bureau Federation. There is some hope in these dispatches. Comes, too, the message that M. W. Blum, assistant manager of the Growers' Packing and Warehousing Company, branch of the California Prune and Apricot Growers' Association, had resigned about the middle of January. There is encouragement in this also.

In 1921, it became necessary for the division of markets of the California State Department of Agriculture—which, by the way, has not been nearly so enthusiastic in support of Mr. Sapiro as it was when under direction of Mr. Weinstock—to go to the rescue of a number of the co-operative marketing organizations founded on the Sapiro plan. Among these were the Turlock Melon Growers, who, despite a high-salaried staff and a widespreading sales organization, could not find a market for their product. The California Alfalfa Growers' Exchange, in the face of the fact that alfalfa was at a high price, and the crop no larger than average, had to be reorganized. The financial affairs of the California Honey Producers' Co-operative Association were readjusted, the banks at Los Angeles getting their bit during the reorganization. The Rice Growers' Association, threatened with destruction, was reorganized, a substantial loan from Mr. Meyer's War Finance Corporation figuring in this transaction, as it has in a number of others. The Sonoma-Marin County Potato Growers' Association also was organized in that year, and this is important, because it was from this small association that the exploiters of the farmer conceived the idea of organizing all the potato growers of the United States into one huge association, paying tremendous tribute to whoever could control it.

But the gem of the Sapiro-plan organizations in California is the California Prune and Apricot Growers' Association. It was considered the most successful example of co-operative marketing yet put into operation. As a matter of fact, this association has expended more of the money of its members without giving them an adequate return, and, in many instances, without giving them any return at all, than any other similar association, old or new, in the country. Conditions became so bad that a faction in the membership, led by Judge J. R. Welch, of San Jose, California, where the headquarters of the association are located, started a fight for a house cleaning against the entrenched Sapiro interests, of whom one, the Mr. Blum mentioned above, hung on until well into 1924, though the explosion started in 1922. The ousting of the old management, including the manager and the president, is a matter of internal combustion, which might occur in any organization. A trifling matter of nearly $38,000 which belonged to the apricot growers was shown to have been transferred to the prune growers. But the most interesting disclosure of all came in direct connection with Aaron Sapiro, who was made counsel for the prune and apricot growers. Sapiro persistently upheld the discredited management which was eventually forced out by a determined faction of the membership, notwithstanding the fact that he was taking $3,600 a year as a "retainer" from the growers to look after their interests.

Fruit-Growers Receive Payment for 1922 Crop Two Years Late

Members of the California Prune and Apricot Growers' Association, organized, controlled and directed by the Sapiro brothers, received on March 31, 1924, the final payment for the crop of fruit which they delivered to the management of this association in 1922, two years ago. This payment amounted to $285,000, according to A. M. Mortensen, manager of the association, who also issued the statement that the payment had been made at the end of March, this year.

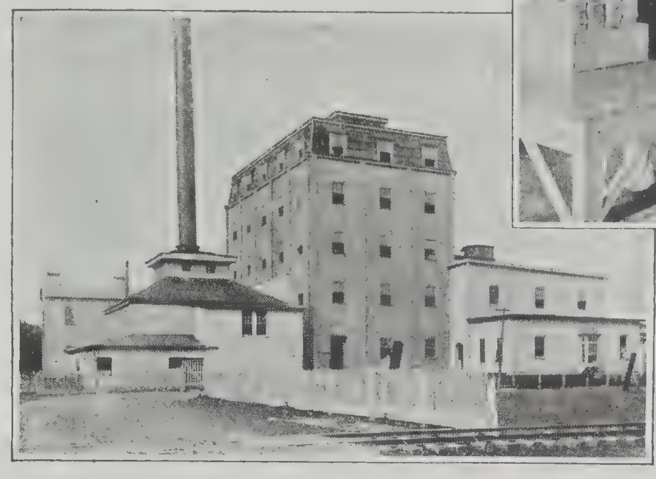
This means that the members of this association have been compelled to borrow money from the banks to carry themselves for two years, paying high rates of interest for funds which, had they not been members of this Jew-controlled organization, they would have received on delivery of their crops. Needless to add, Jewish bankers get the greater part, if not all, of this entirely unnecessary interest payment.

Let us see how that little retainer of $300 a month grew and grew and grew, under the skilful nurture of the Sapiro plan. Sapiro's partners, the Levys, mentioned in the second of this series of articles, went into court in San Jose and endeavored to hold in office the old management, and to expel Judge Welch and seven other members from the association. The Sapiro forces failed, and Judge Welch made public the report of the efficiency committee and the efficiency engineers. It is necessary here to say that, despite the Welch campaign, Sapiro is again in the saddle in the prune and apricot growers' organization. The growers who followed Welch put into office just the men Sapiro wanted in power, and there they are, with Sapiro still counsel, still dictator, still controller of the lands, the crops, the income, the marketing, and even the pay of the American farmers who comprise this association.

During 1920, 1921 and 1922, Aaron Sapiro drew from the California Prune and Apricot Growers, Inc., the parent association, $86,335 in fees, of which $3,083 went to other attorneys (all in the Sapiro firm) and the balance of $83,252 into the pockets of Aaron himself. This is an average of $2,312 a month for thirty-six months. Yet, during all but three months and a few days of the thirty-six months, Aaron Sapiro was touring the southern, middle-western and eastern states, organizing the farmers, fruit-growers, vegetable producers and dairymen as well as the tobacco and cotton planters into other co-operative marketing associations, for each of which he is "organizing legal counsellor." It would appear to the business man that an attorney who was paid $2,300 a month to attend to a firm's business, really should put more than one month in twelve into attending to that business.

It was the general understanding of the grower-members of the prune and apricot growers' organization that their legal services were to cost them $3,600 a year. Most of them have not yet learned how Mr. Sapiro collected approximately eight times as much as this for every one of the three years. However, he got it and there seem to be no prospects that any of the members will be able to get back a thin dime from their organizer, counsellor and friend.

It was not until the spring of 1921, when this same association was approximately four years old, that its members learned some interesting things about their own association, its financial condition and their own position.



A Louisiana rice mill. Rice is the most-used food in the world, ard exponents of co-operative marketing have obtained control of some of the rice associations, while they are reaching out for the control of all of them in the United States.

I quote from the report of the efficiency committee mentioned above:

"It was then (1921) for the first time that some of the facts concerning the association affairs came to the light of day. The growers then learned that the management had borrowed from the banks, and that the association then owed the snug sum of $4,650,000; that the manager (Coykendall) was receiving a salary of $25,000 yearly; that the secretary's monthly salary was $1,000; that the head of the sales department (Mrs. Wallace), a stenographer before she went into the employ of the association, was receiving $500 a month, though she was receiving only $65 a month before she went into the employ of the association; and that members of the executive committee were receiving $150 a month."

It was further shown at this time to the astonished growers, who thought that they owned, controlled and operated their own association, that the president, manager, secretary, and the governor's appointee, the representative of the state, knew little about the expenses of the association, and less about its business. Still these officials knew more than the growers did. The governor's appointee to the board of the association, for example, was a wholesale merchant, who never had cultivated a foot of land nor harvested a crop in his life.

At the time that the contracts for this Sapiro-controlled Association of Prune and Apricot Growers were signed in 1917 it was represented to the growers that the association would market the fruit of the members for *five per cent of the net price received* by the association from the trade, less taxes and carry over insurance on prunes held from delivery to January of the following year. This association controls and markets approximately seventy-six per cent of the production of dried prunes and apricots in the state.

> As a matter of fact, it cost the growers in this association, in 1920, *eighteen* per cent of their sales to market their prunes, or thirteen per cent more than had been agreed on.

For the 1920-1921 crop, some even more interesting statistics were brought out by the efficiency committee, whose figures have never been questioned. It was shown that the marketing of this crop on the agreed five per cent commission, with insurance and taxes added, should have cost the growers $836,830.

But it actually did cost the growers $2,091,377, a difference of $1,254,550, which was a dead loss to the growers and which went to join the thirteen per cent loss in the 1919-1920 crop.

One more example, chosen from a score, to show the manner in which the growers who, *supposedly*, organized, owned and operated this association *for their mutual benefit*, were deceived:

Negotiations have been entered into quietly by the agents of the Sapiro plan of co-operative marketing to obtain control of the commercial fisheries of this country. When they do get such control, they will collect from both the producer and the consumer, as they have in the co-operative marketing associations in farm products. This is a corner of a California fish-canning plant.

On the statement issued by the now-discredited management of the association, for the 1921 crop, appears this item:

Freight and storage, cartage
paid back by trade................$508,327.

In another statement, prepared by McLaren-Goode & Company, a firm of accountants, this item is placed at $474,038, and these last figures are borne out by the report of the independent committee of efficiency engineers. A discrepancy of $34,289?

Added to the $1,254,550 loss on the 1920-21 crop through overcharge for marketing, this makes $1,288,839, which the growers should have had but did not get. Added to this, the precious management of this association paid out $421,145 for "brokerage," on fruit sold by their own sales department. And this was $91,117 more than was paid for the same purpose on the 1920 crop.

Due to the efforts of Judge Welch and several other members of the organization, the California prune and apricot growers were saved, temporarily at least, from utter disaster. There hardly can be a question that their misfortune was due to downright dishonesty of management, though just where the blame lies never has been revealed. Some of those who exposed conditions under the Sapiro plan have been terrified—and I mean *terrified*—into silence by their Jewish masters; others have decided to pocket their losses, smile, watch their directors and managers a little more closely, and let the dead past bury its own dead. But the manipulators of the fruit crop, the exploiters of the California orchardist, are far from dead, and the fruit-grower who is out of the California Prune and Apricot Growers, Inc., is a fortunate man.

The business handled by co-operative marketing associations in the United States in 1922—the latest year for which complete figures are available—totaled a little more than $1,000,000,000—one billion dollars. California alone handles about $240,000,000 worth of products of the soil through co-operative associations every year. The Sapiro plan has been given its widest application in that state. Here is what the Sapiro plan actually does in California, and what it is to be made to do, locally, by states, by crops, and, eventually, by the entire nation:

Binds the producer to turn over his entire production for a period of years to men outside the agricultural industry, and allows them to sell it at a price they fix.

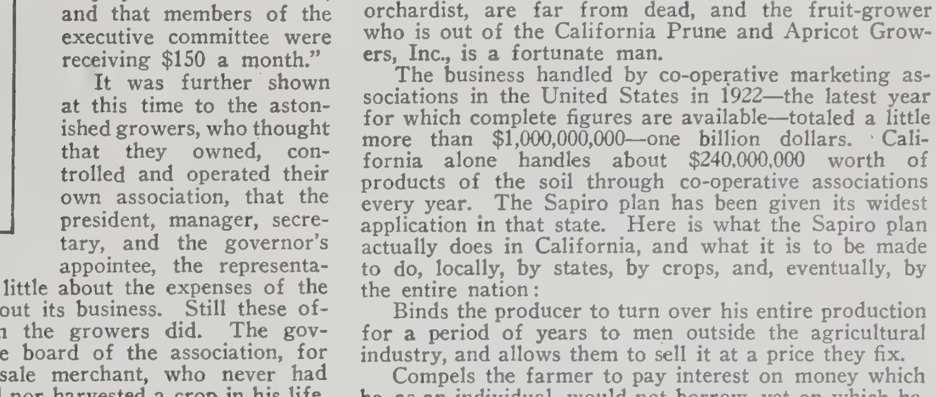
Compels the farmer to pay interest on money which he, as an individual, would not borrow, yet on which he, as a member of the association, must pay interest. This is one of the cleverest tricks in the Jewish deck, the "bankers' joker," so to speak.

Puts the farmer, grower or producer completely in the hands of the directors of the association, without giving him other than a figurative (and largely fictional) voice in the disposition of his property.

Destroys the small local association and substitutes for it a "branch" of the main association.

Completely eliminates contact between the grower and his market. It is an irrefutable principle of economics that the closer the contact of the producer with the consumer, the greater the profit to the producer and the lower the cost to the consumer.

Fixes an arbitrary price, regardless of the demands of the market, or the ability of the public to consume, and attempts, either by costly advertising or by holdovers and storage, to bolster a falling market. These methods, as well as the original price-fixing, work injustice to the consumer, and handicap the producer.



On their knees to the controllers of American farm products. Picking strawberries for distribution and sale through an association operated under the Sapiro plan.

Gold Standard "Dead as Mutton"—Keynes

Noted Economist Writes Startlingly Frank Book on Failure of Gold, Danger of Interest and the Immediate Need of Monetary Reform

To illustrate how far ahead of the United States other countries have forged in their study of the Money Question, excerpts from the work of various thinkers have been presented here from time to time. John Maynard Keynes, whose notable book, "The Economic Consequences of the Peace," won wide fame, has written a startlingly frank and very able new book on "Monetary Reform," published by Harcourt, Brace & Company, New York. This book will greatly enhance Mr. Keynes' reputation as a thinker, but his fearless handling of the Gold Standard and his warnings concerning the effects of usury can scarcely be welcomed by the Money Power. However, Keynes' face is now in the right direction.

SPEAKING of the factors which produce a change in the value of money, Mr. Keynes says:

"It is one of the objects of this book to urge that the best way to cure this mortal disease of individualism is to provide that there shall never exist any confident expectation either that prices generally are going to fall or that they are going to rise; and also that there shall be no serious risk that a movement, if it does occur, will be a big one . . . The remedy would lie in so controlling the standard of value that, whenever something occurred which, left to itself, would create an expectation of change in the general level of prices, the controlling authority should take steps to counteract this expectation by setting in motion some factor of a contrary tendency. Even if such a policy were not wholly successful, either in counteracting expectations or in avoiding actual movements, it would be an improvement on the policy of sitting quietly by, while a standard of value, governed by chance causes and deliberately removed from central control, produces expectations which paralyze or intoxicate the government of production. (pp. 43, 44)

"We see that rising prices and falling prices each have their characteristic disadvantages. The inflation which causes the former means injustice to individuals and to classes—particularly to investors; and is therefore unfavorable to saving. The deflation which causes falling prices means impoverishment to labor and to enterprise by leading *entrepreneurs* to restrict production in their endeavor to avoid loss to themselves; and is therefore disastrous to employment . . .

"Inflation is unjust and deflation is inexpedient. Of the two, perhaps deflation is, if we rule out exaggerated inflations such as that of Germany, the worse; because it is worse, in an impoverished world, to provoke unemployment than to disappoint the *rentier*.

"But it is not necessary that we should weigh one evil against the other. It is easier to agree that both are evils to be shunned. The Individualistic Capitalism of to-day, precisely because it intrusts saving to the individual investor and production to the individual employer, *presumes* a stable measuring-rod of value, and cannot be efficient—perhaps cannot survive—without one. (pp. 44, 45)

"Tricks" of the Gold Standard

"CONFIDENCE in the future stability of the value of gold depends on the United States being foolish enough to go on accepting gold which it does not want, and wise enough, having accepted it, to maintain it at a fixed value. This double event might be realized through the collaboration of a public understanding nothing, with a Federal Reserve Board understanding everything. But the position is precarious; and not very attractive to any country which is still in a position to choose what its future standard is to be . . .

"It is natural, after what we have experienced, that prudent people should desiderate a standard of value which is independent of Finance Ministers and State Banks. The present state of affairs has allowed to the ignorance and frivolity of statesmen an ample opportunity of bringing about ruinous consequences in the economic field. It is felt that the general level of economic and financial education among statesmen and bankers is hardly such as to render innovations feasible or safe; that, in fact, a chief object of stabilizing the exchanges is to strap down Ministers of Finance. (pp. 182, 183) . . .

"If, indeed, a Providence watched over gold, or if Nature had provided us with a stable standard ready-made, I would not, in an attempt after some slight improvement, hand over the management to the possible weakness or ignorance of Boards and Governments. But this is not the situation. We have no ready-made standard . . . And—most important of all—in the modern world of paper currency and bank credit there is no escape from a 'managed' currency, whether we wish it or not;—convertibility into gold will not alter the fact that the value of gold itself depends on the policy of the Central Banks. (p. 184) . . .

"Those who advocate the return to a gold standard do not always appreciate along what different lines our actual practice has been drifting. If we restore the gold standard are we to return also to the pre-war conceptions of bank-rate, allowing the tides of gold to play what tricks they like with the internal price-level, and abandoning the attempt to moderate the disastrous influence of the credit-cycle on the stability of prices and employment? Or are we to continue and develop the experimental innovations of our present policy, ignoring the bank ratio and, if necessary, allowing unmoved a piling up of gold reserves far beyond our requirements or their depletion far below them? (p. 186) . . .

"In truth, the gold standard is already a barbarous relic. All of us, from the Governor of the Bank of England downward, are now primarily interested in preserving the stability of business, prices, and employment, and are not likely, when the choice is forced on us, deliberately to sacrifice these to the outworn dogma, which had its value once, of £3:17:10½ (three pounds, seventeen shillings, tenpence half-penny) per ounce. Advocates of the ancient standard do not observe how remote it now is from the spirit and requirements of the age. A regulated non-metallic standard has slipped in unnoticed. *It exists.* Whilst the economists dozed, the academic dream of a hundred years, doffing its cap and gown, clad in paper rags, has crept into the real world by means of the bad fairies—always so much more potent than the good—the wicked Ministers of Finance. (p. 187) . . .

"Therefore, since I regard the stability of prices, credit, and employment as of paramount importance, and since I feel no confidence that an old-fashioned gold standard will even give us the modicum of stability that it used to give, I reject the policy of restoring the gold standard on pre-war lines. At the same time I doubt the wisdom of attempting a 'managed' gold standard jointly with the United States, on the lines recommended by Mr. Hawtrey in his 'Monetary Reconstruction' because it retains too many of the disadvantages of the old system without its advantages, and because it would make us too dependent on the policy and wishes of the Federal Reserve Board. (pp. 190, 191) . . .

"Nor must we neglect the possibility of a partial demonetization of gold by the United States through a closing of its mints to further receipts of gold. The present policy of the United States in accepting unlimited imports of gold can be justified, perhaps, as a temporary measure, intended to preserve tradition and to strengthen confidence through a transitional period. But, looked at as a permanent arrangement, it could hardly be judged otherwise than as a foolish expense. If the Federal Reserve Board intends to maintain the value of the dollar at a level which is irrespective of the inflow or the outflow of gold, what object is there in continuing to accept at the mints gold which is not wanted, yet costs a heavy price? If the United States mints were to be closed to gold, everything, except the actual price of the metal, could continue precisely as before. (p. 182) . . .

"The United States has not been able to let gold fall to its 'natural' value, because it could not face the resulting depreciation of its standard. It has been driven, therefore, to the costly policy of burying in the vaults of Washington what the miners of the Rand have laboriously brought to the surface. Consequently gold now stands at an 'artificial' value, the future course of which almost entirely depends on the policy of the Federal Reserve Board. The value of gold is no longer the resultant of the chance gifts of Nature and the judgment of numerous authorities and individuals acting independently." (p. 181) . . .

Prof. Irving Fisher's Plan

IN HIS chapter, "Positive Suggestions for the Future Regulation of Money," Mr. Keynes points out what appear to him as defects in Prof. Irving Fisher's plan:

"The pioneer of price-stability as against exchange-stability, Prof. Irving Fisher, advocated the former in the shape of his 'compensated dollar,' which was to be automatically adjusted by reference to an index number of prices without any play of judgment or discretion. He may have been influenced, however, by the advantage of propounding a method which could be grafted as easily as possible on to the pre-war system of gold-reserves and gold-ratios. In any case, I doubt the wisdom and practicability of a system so cut and dried. If we wait till a price movement is actually on foot before applying remedial measures, we may be too late. As Mr. Hawtrey says: 'It is not the *past* rise in prices but the *future* rise that has to be counteracted.' . . . Prof. Fisher's method may be adapted to deal with long-period trends in the value of gold but not with the often more injurious short-period oscillations of the credit cycle. (pp. 202, 203) . . .

"We have scarcely realized how far our thoughts have travelled during the past five years. But to re-read the famous Cunliffe Report on Currency and Foreign Exchange after the War, published in 1918, brings vividly before one's mind what a great distance we have covered since then. This document was published three months before the Armistice. It was compiled long before the unpegging of the pound sterling and the great break in the European exchanges in 1919, before the tremendous boom and crash of 1920-21, before the vast piling up of the world's gold in America, and without experience of the Federal Reserve policy in 1922-23 of burying this gold in Washington, withdrawing it from the exercise of its full effect on prices, and thereby, in effect, demonetizing the metal. . . . Of all the omissions from the Cunliffe Report the most noteworthy is the complete absence of any mention of the problem of the stability of the price-level; and it cheerfully explains how the pre-war system, which it aims at restoring, operated to bring back equilibrium by deliberately causing a 'consequent slackening of employment.' The Cunliffe Report belongs to an extinct and an almost forgotten order of ideas. Yet the Report remains the authorized declaration of our policy, and the Bank of England and the British Treasury are said still to regard it as their marching orders. (pp. 210, 211) . . .

"If we agree that gold is not to be employed in the circulation, and that it is better to employ some other criterion than the ratio of gold reserves to note issue in deciding to raise or to lower the bank rate, it follows that the only employment for gold (nevertheless important) is as a store of value to be held as a war-chest against emergencies and as a means of rapidly correcting the influence of a temporarily adverse balance of international payments and thus maintaining a day-to-day stability of the sterling-dollar exchange. . . . Nor would the amount of gold, which it would be prudent to hold as a reserve against international emergencies and temporary indebtedness, bear any logical or calculable relation to the volume of paper money; for the two have no close or necessary connection with one another. Therefore I make the proposal—which may seem, but should not be, shocking,—of separating entirely the gold reserve from the note issue. (pp. 211, 213) . . .

The "Dollar" Standard

"THE principles underlying these proposals remain just as true across the Atlantic. In the United States, as in Great Britian, the methods which are being actually pursued at the present time, half consciously and half unconsciously, are mainly on the lines I advocate. In practice the Federal Reserve Board often ignores the proportion of its gold reserve to its liabilities and is influenced, in determining its policy, by the object of maintaining stability in prices, trade, and employment. Out of convention and conservatism it accepts gold. Out of prudence and understanding it buries it. Indeed, the theory and investigation of the credit cycle have been taken up so much more enthusiastically and pushed so much further by the economists of the United States than by those of Great Britian that it would be even more difficult for the Federal Reserve Board than for the Bank of England to ignore such ideas or to avoid being, half-consciously at least, influenced by them.

"The theory on which the Federal Reserve Board is supposed to govern its discount policy, by reference to the influx and efflux of gold and the proportion of gold to liabilities, is as dead as mutton. It perished, and perished justly, as soon as the Federal Reserve Board began to ignore its ratio and to accept gold without allowing it to exercise its full influence, merely because an expansion of credit and prices seemed at that moment undesirable. From that day gold was demonetized by almost the last country which still continued to do it lip-service, and a dollar standard was set up on the pedestal of the Golden Calf. For the past two years the United States has *pretended* to maintain a gold standard. *In fact* it has established a dollar standard; and, instead of insuring that the value of the dollar shall conform to that of gold, it makes provision,

(Concluded on page 14)

Mr. Ford's Page

THERE are sixteen investigations in progress in the Congress at this writing, which may mean any or all of three things. It may mean that there has been a most amazing amount of wrongdoing in public office; it may mean that a number of inquiring minds have suddenly decided to learn for themselves how the business of government has been done; it may mean that political and campaign material is being sought out of the naturally fallible actions of public men.

Looking over the list of these investigations it becomes clear that the best harvest that can be hoped for is the harvest of knowledge. This is only what any post mortem is expected to yield. If it does not, the effort is wasted. The knowledge that it may yield is of three possible kinds; whether all the alleged misdeeds really occurred; whether such as have occurred are due to bad intention or ignorance; and how to prevent the same things from occurring again. For it requires more than curiosity to justify a post mortem; its whole value is in enabling us to prevent recurrence in the future.

It is almost certain that there can be no large measure of reparations or recovery of damages, as a result of these investigations (except, it may be, in the matter of lands and natural resources) so that our chief gain must be more knowledge.

This statement is of itself sufficient to forestall the charge that one opposes the investigations. We have just mentioned knowledge as their best fruit, but knowledge comes through experience, and these investigations are a part of the nation's experience. It is only to be hoped that through this experience the government will not fail to get knowledge.

Running through the list of the various investigations, what may we hope from them? Of course we must first hope *for* them a seriousness of intention and method. Let them search for the fact—always the fact. An investigation is a trial of an action, an inquiry into all the elements necessary to a judgment. That of itself should save it from descending to factionalism of any kind.

We must also hope for our people the judicial mind. What may be charged is not thereby proved. Here is a publication which has had in its files for several years much of the material that is now finding its way out through the Congressional Investigating Committees, and some that perhaps will not so find its way. This material could have been printed, exposure of certain suspicions and certain strange-looking situations might have been made, but that would not have been proof. The public appetite for sensation and scandal might have been pleased, but that would not have been sound proof of the actual situations. And neither is testimony before a Committee. As a trial before public opinion the contentions of the prosecuting witnesses have probably won a widespread verdict of Guilty, and doubtless the public is as often right in these matters as any other body could be. But nevertheless, accusation is not proof. And the people would not so often mistake it for proof if legal methods did not permit of so much juggling and escape.

So, with these matters in mind, what may we expect *from* these sixteen investigations in progress? In the Teapot Dome matter we may expect exact knowledge whether United States rights were tamely given away, and if so how this whole leasing system can be brought out into the open and avoid even the appearance of evil. That is about all the country can expect in that instance, except the possible cancellation of the leases if found to have been corruptly obtained or contrary to the public interest.

The Committee investigating the conduct of the Department of Justice cannot be expected to do much more than to discover cases that may have been handled with favoritism or shelved for the same reason, and start belated justice again on their trail. It might perform a service to straight dealing if it would inquire also how far a government department is permitted to invade the rights of citizens through the use of vicious private detective methods.

The Committee investigating the Russian situation, or "the American activities of the Soviet government," as the title runs, can do much good by thrusting its inquiry beneath the superficial, that is, the political, aspect of the question, and dig out the real sources of Sovietism. It is rather strange that Americans are still talking of a "Russian Communism" that has been abandoned in Russia, and are carefully refraining from the study of that idea, that purpose which always exists regardless of the form of government. The Committee could serve the people by giving it the philosophy and method of organized revolutionism as it now exists; but this would lead into certain racial investigations which, it is understood, Congress is not willing to take up as yet.

Instead of fighting off investigations, they should be welcomed where demanded. There is no reason why the Internal Revenue Bureau should not be opened to Senators, if only to satisfy the public of the administration of a bureau that has become vitally important to the spirit of confidence in multitudes of our citizens. Crooks may be found, of course, unless they are kicked out beforehand; but a department head who does his full duty will always come out ahead in one of two ways; either he will be kicked out by politicians and therefore will not be present when eventually his department is investigated, or he will always be able to throw open the doors to all comers and say, "Gentlemen, if you can find anything I have overlooked, I'll be obliged to you."

As to the Committee investigating propaganda whether it be on the Mellon tax plan or the Bok peace plan, it too can add to the nation's knowledge if it will take propaganda as a whole and issue so comprehensive a guide to its detection that the public will never be fooled again. The tax plan and peace plan publicity were angelic compared with what is going on all the time, even around Congress.

There is the Shipping Board investigation, too. That Committee deserves sympathy. If it seriously undertakes its work, it will require half a lifetime to unravel the tangle. It would not be worth while unraveling unless it gave us preventive information for the future. Of all complexities, there is none like the history of the Shipping Board. Perhaps all that we can expect from it is a report on some of the thousands of ways to tie up a big business.

Other matters should have been cleaned up by executives and never left to Committees, as the matter of the alleged duplication of securities in the Bureau of Engraving and other similar difficulties which in private business would have been straightened out at the moment, not two years later. Now they are in the hands of investigating committees and, of course, being there, the utmost rigid thoroughness ought to mark their examination.

Some of the Committees occupy a position similar to that of Chairs in the University. They are making researches which should enable them to teach the people valuable lessons in frustrating the activities of the forces of subversion. Other Committees are ironing out current difficulties of administration. Our government cannot claim perfection until a system is created which will take care of these matters by prevention, rather than by the tardy and expensive method of post-mortem examination.

SOME of the investigations now proceeding in Congress are important because they constitute serious studies in methods of doing government business. We may expect from these sufficient information to form the basis for better methods. Others of the inquiries deal with matters that could have been settled at the time by any competent foreman who did not know how to spell "politics." Now that the Committees have been set up and are at work there is nothing for them to do but justify themselves by the permanent character of the work they perform. They are research bodies in public affairs. As such they can easily command national respect by the quality of their motives and methods. The pardonable amount of partisan zeal which may mark debates in Congress has no place whatever in this important Committee work.

A volume of 452 pages, durably bound, containing 98 of these articles, under the title of "Ford Ideals," will be sent postpaid for $1.00.

Cutting Off a Year

PROMINENT educators are seeking a substitute for the present standard four-year college course. The traditional term is in danger of being set aside in a striking manner.

A three-year course, whose short summer and Christmas vacations will give it as many study hours as the usual four-year term, is to be inaugurated at the new five-million-dollar college for women in Bennington, Vermont, that is being projected by the heads of Wellesley, Radcliffe, Bryn Mawr, Mt. Holyoke, Barnard and other distinguished schools.

The new college is sponsored because the present women's colleges in the East cannot take care of the young women seeking to attend them. The new institution is planned that parents may be spared the expense of unnecessarily long collegiate courses.

American parents will welcome anything that will spare the sacrifice necessary to send children to college for four years, if three years will do as well. It is significant that our tax-supported state universities have not led the way in this possible improvement; it had to be done by those who appeal to private citizens for endowments.

What of That "Surplus"?

THE Treasury Department announces the offering of $400,000,000 certificates of indebtedness, running for one year at four per cent. This amount, in addition to collections on March 15, is announced to be necessary to meet interest and maturities on the public debt for the March account. It is further announced that additional financing will be necessary in June.

To those who have accepted the statements of the department that the revenues have so far overbalanced requirements as to leave a surplus of more than $300,000,000 for the current fiscal year, the announcement must cause surprise. We have been told that the public indebtedness was reduced to the amount of practically a billion dollars during the year, and while it is generally understood that this means simply that present available funds are merely offset against the aggregate debt, the showing was creditable. But as the new offering is made with the expectation of using also such funds as are available, it will be seen that when disbursed the total indebtedness will not have been reduced at all.

The people are entitled to accurate knowledge of the condition of the national finances at all times. This new issue will pass the three billion mark in short-term securities issued since the advent of the present administration, not including savings certificates which do not represent an indebtedness of full face value until maturity. As to how many of these are outstanding, it is doubtful whether even the department has positive knowledge.

Legends of the Dead

DEATH as a rule is not dramatic. Princes and peasants are as alike in their deaths as in their births. Yet there is a cult of dramatic tales of how the great have passed, what their last words were, what depth of wisdom or reach of prophetic insight was vouchsafed to them as they neared the marge of the mystic crossing. When Lenin died, the story sped abroad that he breathed his last crawling around on his hands and knees, cursing the Jews. The basis of the tale, perhaps, was the Russian peasantry's genuine belief that Lenin really stood between them and conquest by international Jewry. Anyway, the tale is typically Russian.

And hardly is Hugo Stinnes gone from his multitudinous activities than the legends begin to be told. They are all attributed to "witnesses of his last moments," but they are all too dramatic to be true.

"Toward the end," says one, "he seemed to see a Communist horde advancing on him. His face was contorted and his voice shrill as he imagined they had come to take his possessions away. It seemed as if they advanced nearer and nearer until he felt their hands about his throat, and he fell back, exhausted, breathless, in fearful agony. He recovered for a moment. Then he reviled his enemies with terrible curses."

This is New York *World* stuff and is to be given the same degree of belief as most of the "foreign correspondence" fed the American public.

Vanderlip's Venture

MR. E. P. Swenson is by way of being a Wall Street personage. Chairman of the board of the National City Bank, he is influential in various other companies. Most of the public was ignorant of Swenson's existence until the other day he wrote Frank Vanderlip a nasty letter removing him from the directorates of some Freeport, Texas, companies because Vanderlip has busied himself with the Washington scandals, some of which involved international bankers and business men.

Swenson wrote the sort of letter that goes to any man who doesn't play the Wall Street game according to the unwritten rules:

"I cannot advise you of this feeling solely on behalf of the other directors, for, personally, I am not in sympathy with your attitude in public matters. As a friend, I have asked many times the question in my own mind as to whether you stop to consider the ultimate results and how they may affect you personally."

Mr. Vanderlip might have answered, "What shall it profit a man if he gain the whole world and lose his own soul?"

Mr. Vanderlip's retirement from the presidency of the National City Bank in 1919 was coincident with a frank expression of opinion on European affairs. Now come other retirements coincident with his bold stand for clean government.

To anyone familiar with the signs, certain interests are afraid of what Vanderlip knows and may tell; they are using the familiar method of trying to discredit him in advance. The prophecy may be risked that they will not succeed. Mr. Vanderlip was not born yesterday and, more significant still, he has not always been a banker: his newspaper training is still observable in his strong reliance on facts.

Now that he has set up his own research bureau to get at the facts, to do his utmost to meet "the fact shortage of America" (to quote "Mr. Ford's Page"), there is a tremor in the ranks of those who fear the facts. More dangerous to the American people than all the Teapot Dome disclosures is the organized daily, insidious, widely ramified efforts of Mr. Vanderlip's erstwhile co-workers to prevent facts reaching the people and to plant in lieu of facts a set of ideas along which the American mind is to be regimented.

We are not prophesying how thorough or useful Mr. Vanderlip's new service venture will be. Even brave men are cowed by some of the discoveries they make when they go out to seek facts. Even honest men sometimes hedge when it comes to calling out names. But, no matter by whom, the work is going to be done.

Pay-As-You-Go System

A LATTICE girder wooden bridge was erected over the river in Chicopee, Massachusetts, in 1847. It cost $7,000 and is still going strong.

The startling increase in the cost of municipal administration is illustrated by the fact that when the floor system of this ancient bridge was rebuilt in 1921 it cost $30,000, more than four times the original cost of the structure.

Back in the good old days when the Chicopee bridge was built, such costs were met out of current taxation. Nowadays, politicians fear to let the people know the full extent of their extravagance, and issue bonds for improvements and sometimes for operating expenses as well.

This is fine for the bond brokers, but the interest upon the bonds makes the improvements cost the taxpayers twice as much as a "pay-as-you-go" policy would entail. This bonding policy compels many cities to pay half their yearly income for interest.

When taxpayers find themselves unable to carry the interest and sinking fund charges of all these accumulated bond issues as well as the regular operating expenses of their respective cities, the system will find itself in imminent danger.

Japan Protests

JAPANESE immigration has been handled in a manner to create difficulties instead of solving them. We have "a gentleman's agreement" adopted after a secret conversation with a President of the United States, the exact terms of which have never been made known. Its purpose, of course, was to save Japan's face by preventing exclusive legislation while at the same time obtaining for us the desired measure of exclusion. That is, Japan agreed to do what was wanted, provided it was not put into legal statutes and enforced. The Japanese government won its point of obtaining the right to itself enforce on its own people the same restrictions we should otherwise have enforced by legal enactment.

Now that it is proposed to include Japanese under an immigration law, the Japanese ambassador makes a strong protest. He says his nation will stand by "the gentleman's agreement" or any modification of it which may be agreed upon, but he wishes to save his nation from the humiliation of being legally classified with other Orientals. The note which he presents to our government is couched in terms and resolves itself into tones that Americans are not accustomed to receive. It did not help the matter. And the fact that he argues on a basis supplied by our own muddling of the question does not help us. For the moment, however, the ambassador has supplied Congress with a touch of that "natural pride" which he pleads in behalf of his own nation, and thus provides a little breathing space for the contending sides.

But it doesn't settle the Japanese Immigration Question. And the time is coming when it must be definitely settled one way or the other. At present it is plain that our government is persuaded to different views of the Japanese than are citizens of the Western coast; the "gentleman's agreement" is a straddle between Japan's contention and that of California. Japan, which has never lacked the highest skill in the game of bluff, talks big enough to breed resentment in minds of better world perspective. But regardless of that, a principle is involved, and the sooner the American people find out which principle it is, and act upon it, the better for the general situation.

Rarely Solitaire

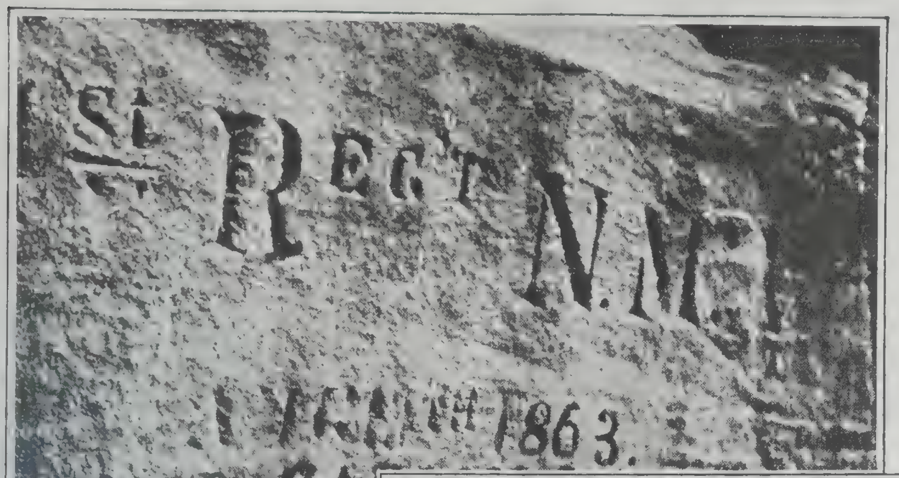
IN A CITY of 60,000 the treasurer has been convicted of embezzlement of some $30,000 and sent to prison for a term of from two to ten years. A man of exemplary personal habits, for thirty years a trusted citizen, he lost the money in stock speculation. His friends joined in asking a parole for him, placing the circuit judge before whom he was tried in a position of embarrassment, because he could not consistently free a popular man and in perhaps the next case send a friendless man to prison for a felony less offensive.

It would have been better if the friends, instead of trying to stay the hand of the law, had made up the defalcation before the law was invoked. Many of them, no doubt, were his companions in stock gambling, with the only difference that they used money belonging to their families, if they lost, instead of money not their own. Speculation, like other folly, is rarely a game of solitaire.

Discussion still swirls around President Coolidge's responsibility for the Harding Cabinet. Those who would injure the President claim he should have thrown out some of his predecessor's appointees. Those who defend him say that he was only following precedent by retaining them. The Cabinet itself could have forestalled all this difficulty by resigning. Cabinet members are personal appointees of the President, and in that sense they rise or fall with the President who appoints them. In practice, however, they are usually the choice of the party as well as of the President, and the continuance of the Cabinet in office is held to continue the party government which had been elected by the people. From this point of view it is held that the Cabinet gives continuity to the government across any breach caused in the performance of Presidential duties. The argument is somewhat strained, inasmuch as the Vice-President immediately assumes Presidential functions. Recent experience emphasizes the wisdom of a Cabinet resigning en masse upon the death or removal of the President appointing it.

The "gentleman from New York" who assailed the Muscle Shoals offer because "attacks" on the Jews caused pogroms in Poland in 1919 is mixed in his dates. The Poles woke up to the Jewish Question about 1790, while the articles in THE DEARBORN INDEPENDENT did not begin until 1920.

Famous Frontiersman Leaves His Calling Card



Photos by U. S. Forest Service

Above—The card Kit Carson left, carved deeply in the face of the rock on the trail he blazed in pursuit of rebellious Navajo Indians under War Department orders, in 1863.

Right—Kit Carson's grave in Taos, New Mexico.

Kit Carson's Record Cut in Rock Sixty Years Ago Discovered by Exploring Party; Facts Borne Out by War Department Order

By S. R. WINTERS

"OLD KIT'S calling card, by all that's holy," exclaimed a member of a party that camped one night on a sheep ranch en route to the annual snake-dance ceremony of the Hopi Indians, in Northern Arizona. This exclamation had reference to the discovery of a rock on the face of which was imprinted the name and regiment number of Kit Carson, who sixty years before had quelled an uprising of Navajo Indians and arrested their plunderings and robberies of the citizens of New Mexico.

Among the group of persons that camped at a desert water hole that night, which resulted in the unearthing of evidence of a bit of thrilling American history in the frontier days, was Will C. Barnes, forester, cowboy, author and prince of fellows. He brought back to Washington a series of photographs showing the discovery made by this party while on their way to the snake-dance ceremony in Northern Arizona. This pictorial evidence, coupled with an order copied from the records of the War Department, support the conclusion that Kit Carson was in that vicinity on the date imprinted deeply on the face of a rock on the trail this warrior blazed in the pursuit of the rebellious Navajo Indians.

The following order was issued by the War Department:

"General Orders, No. 15
"Headquarters, Dept. N. M.
"Santa Fe, N. M.,
"June 15th, 1863.

"For a long time past, the Navajo Indians have murdered and robbed the people of New Mexico. Last winter, when eighteen of their chiefs came to Santa Fe to have a talk, they were warned and told to inform their people that for these murders and robberies the tribe must be punished unless some binding guarantees should be given that in future these outrages should cease. No such guarantees have yet been given, but, on the contrary, additional murders and additional robberies have been perpetrated upon the persons and properties of our unoffending citizens.

"It is therefore ordered that Colonel Christopher Carson, with a proper military force, proceed without delay to a point in Navajo country known as Pueblo, Colorado, and there establish a defensible depot for his supplies and hospital, and thence to prosecute a vigorous war upon the men of this tribe until it is considered at these headquarters they have been effectively punished for their long-continued atrocities.

"By command of Brigadier General Carleton:
"(Signed) Benjamin C. Cutler,
"Assistant Adjutant General."

The manner in which this party of snake-dance attendants stumbled upon this bit of historic lore is quite as interesting as the find itself. The discovery was made a few miles below the present Keams Canyon Indian School, the namesake of Tom Keams, a pioneer who founded an Indian trading post in this locality in 1876. Will Barnes, in his inimitable style, tells about how this group of wanderers on the way to a Hopi village unearthed Kit Carson's calling card. He states:

"That night a Navajo boy, herding sheep on the mesa above, came to the water hole for a supply of water for his sheep camp. While he was filling two ten-gallon kegs slung on the "sawbuck" pack-saddle cinched to a diminutive burro, one of the party questioned him as to the road ahead, the grass for their horses, the exact date for the snake ceremony—always an uncertainty—and also asked him if he knew of any cliff-dwellers' ruins or hieroglyphics they could look over on their way to the Hopi village.

"The boy, with a combination of Spanish, Indian, and English, ably filled out with a plenteous supply of signs, answered their questions as best he could, and what the interrogators didn't understand they guessed at, just as the majority of explorers in strange lands have ever interpreted the information imparted to them by the natives. When it came to the matter of pictographs the questioner took a piece of sharp rock and scratched a few crude figures upon the near-by canyon wall. "You sabby?" he asked. The boy's face lit up. "Si, si," he exclaimed eagerly, pointing down the canyon as if to indicate the location of the place where cryptic writings could be viewed.

Bold Cliffs and Yawning Chasms

"BEFORE the boy left with his burro-load of water, he had agreed to guide the party to the place where the pictographs were to be found, which he explained was "No mucho lejos"—not very far. Early next morning the boy rode into camp, and the men of the party were soon mounted and following him down the canyon. Arrived at a rather wide opening in the canyon, the boy reined in his pony and pointed toward the sky line of the canyon's crest. The walls here were from a thousand to fifteen hundred feet high, but not perpendicular, being formed by a number of ledges of varying thickness, each with a sloping mass of talus at its foot, the result being a series of terraces until at the top the canyon was probably ten times as wide as at the bottom.

"The boy indicated that the hieroglyphics he would show them were at the very top of the canyon, and promptly pointed his pony up the first slope, which was not only exceedingly steep, but also a mass of sharp, broken rocks, 'just like riding over a pile of broken beer bottles,' one of the party declared.

"The diminutive Navajo pony, without a shoe to a single foot, plunged through the rocks, often flinching from the sharp points, but forging straight ahead under the constant lash of the rawhide 'quirt' in the boy's right hand, plus a very devil's tattoo played on his none-too-well-covered ribs by both heels of the rider. We followed, but our horses, though grain-fed and well shod, made mighty poor work of the climb.

"Soon the kid picked up a trail which zigzagged up the side of the canyon, finding here and there narrow openings or passes in the bold cliffs, where from the bottom nothing but a solid wall of stone seemed to exist, until we reached the last terrace, with a last wall above us possibly twenty feet high. The trail here led along the edge of the talus, with the ledge of the cliff below yawning under our stirrups until it turned up through a narrow cleft to the mesa above. Just before we reached this turn, the boy slipped from his pony and we followed him to the foot of the ledge, where he pointed triumphantly to some carvings on the face of a smooth sandstone, which were pictographs all right, but neither prehistoric nor Indian. Carved deeply into the rock, which was protected from the weather by an overhanging shelf, we read, easily:

"1st Regt. N. M. Vols.
Aug. 17th, 1863
Col. C. Carson Comdg."

Although Mr. Barnes tells this writer that several subsequent trips to the former location of this historic rock have failed to reveal its original identity, the first evidence is indisputable. This former cowboy, who is now in charge of grazing experiments of the Forest Service, United States Department of Agriculture, also delved into the records of the War Department, revealing other interesting bits of history than the general order already cited. Additional orders instructed Kit Carson to designate the new post after General Canby, who had recently relinquished command of the Department of New Mexico. General Canby a few years prior to that had met death at the hands of the Modoc Indians in the lava beds of Northern California.

Noteworthy, also, in contrast with present-day warring tactics, Carson was allowed only three other commissioned officers to handle 333 enlisted men, the number comprising a regiment sixty years ago. The records of the War Department indicate that Carson transmitted official reports frequently to Washington, indicating the progress of the expedition. Among these reports was found the one which virtually verifies the carving found near a sheep camp. It reads as follows: "At 8 a. m. on the 23rd (August), 1863, arrived at the west opening of the Canyon de Chelley, but could find no water. About twelve miles further found abundance of running water and good grass and encamped."

Carson's Devastating Warfare

THE reports of the War Department were dated Fort Canby, New Mexico, August 31, 1863. The evidence tends to support the belief that Fort Canby was located on the Pueblo Colorado "Wash," a few miles east of where Will Barnes and his party camped and just over the line into what is now Arizona. The latter state was not divorced from the mother state of New Mexico until December, 1863. The Canyon de Chelley lies to the northeast where Kit Carson's calling card was located and the reports suggest that this warrior bold scouted to the westward from Fort Canby into the vicinity of Keams Canyon, where he left his impress on stone, and then swerved his course to the northeast, toward Canyon de Chelley, where the Indians were sequestered in canyon depths.

The methods of warfare in the frontier days were quite as devastating as were those which swept clean the battlefields of European soil in the recent World War. Kit Carson resorted to the method of starving the Indians into submission. To accomplish this end, he cut down in excess of 3,000 producing peach trees in one canyon alone, and his charges were ordered to level peach orchards with the ground wherever found. Moreover, these devastating tactics resulted in the slaughter of more than 50,000 sheep and goats that belonged to this tribe of Indians. Will Barnes, who figuratively knows every cow path and pig trail in this section of our country, observes that the Hopi Indians, then residing west of the Navajo Indians, have today many peach orchards. It is likely that the trees destroyed by Carson and his army belonged to these Pueblo Indians, described as an inoffensive and kindly disposed race of men. The Navajo Indians, it is assumed, had hardly established a permanent agriculture so early. The Hopi Indians, however, have cultivated peach orchards, among the sand hills, for centuries.

Closing Days

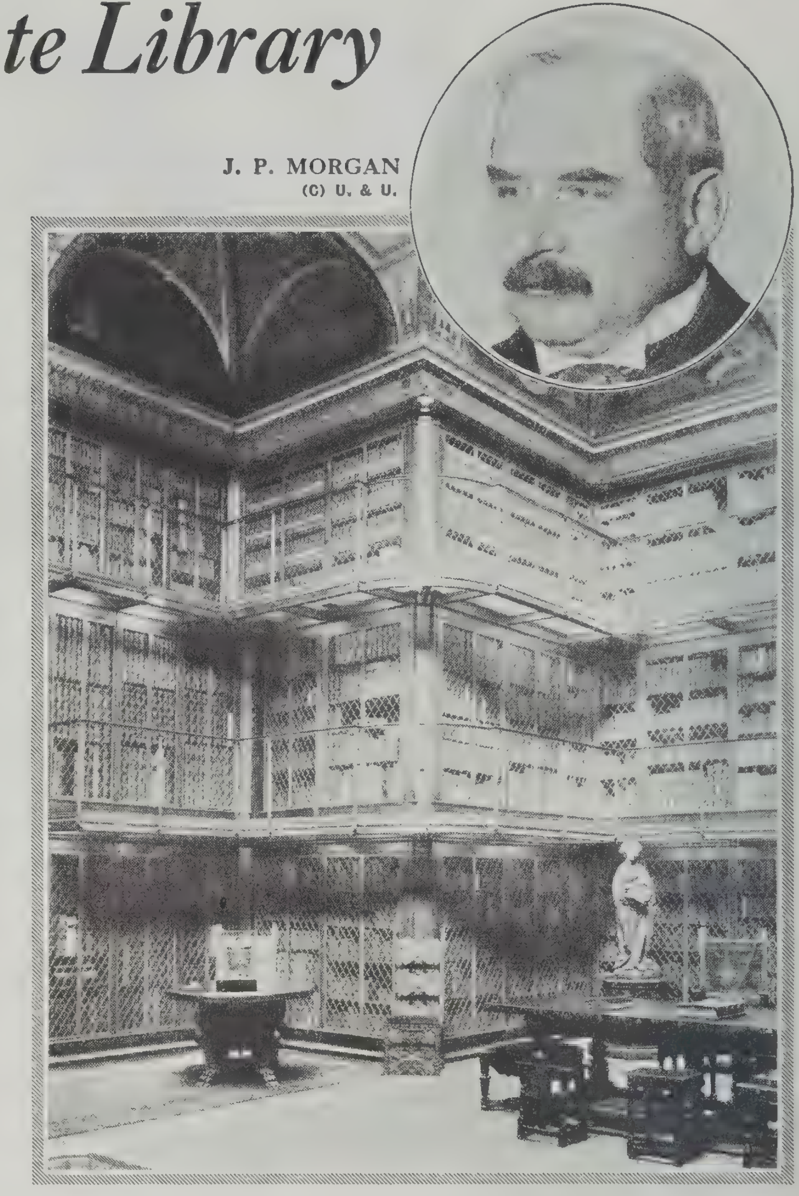
THE eventful life of Kit Carson, whose career was replete with thrilling incidents in subduing the Indians and unruly members of his own race, came to an end on May 23, 1868. Unlike the storm-tossed life he had lived, his passing across the Great Divide was peaceful, the end coming in his bed at Fort Lyons, Colorado. This point was one of the early outposts of civilization in that region. As a government station it has retained its identity to this day. It is situated on the north bank of the Arkansas River, a short distance east of La Junta.

The quaint town of Taos ("Towse"), New Mexico, was for years identified by Kit Carson as his home. At this place he obtained a wife and his request was that his body be buried there. This request was granted and his remains are slumbering in the dust in the little "Campo Santo" of the Mexicans, where the body of his wife was also interred. Mr. Barnes says, "Near by the wonderful six-story edifice of the Taos Pueblo Indians rises into the clear blue sky like some modern pyramid, while dominating the whole region the mighty peaks of the "Sangre de Christo" range (The Blood of Christ) form a backbone at once glorious and inspiring."

World's Finest Private Library Property of Public

Gift of Priceless Books and Manuscripts Sets Mark in Educational Benefactions—Intrinsic Value Greater Than Millions at Which Appraised

By JULIUS MORITSEN



J. P. MORGAN
(C) U. & U.

An excellent survey showing how the priceless books are housed.

THE gift of the J. Pierpont Morgan's private library to the City of New York can be appreciated only by remaining aloof from the money values involved and considering what this magnificent gift means to the present and to future generations.

One may say that perhaps some ten million dollars could not buy the magnificent structure on East Thirty-sixth street and its priceless contents. But the spirit of reverence for all that is beautiful and lasting in art and letters, such as must have moved the elder J. Pierpont Morgan to gather together these treasures of past ages; it is this thought that crowds upon the mind as the observer steps across the threshold of the library building and is brought into rapport with perhaps the greatest collections of their kind in the world.

This building, known as a library, in truth a beautiful art gallery, is in the Italian Renaissance style, in white marble, approached from the street by a stone walk, which cuts through a vivid oblong of green lawn. Once inside the bronze doors of the building, one finds himself in a vaulted entrance hall paved with Roman stones, with a great circular piece of porphyry, on either side of which stands a pair of Cipolino columns of greenish marble from the Chateau de Bagatelle in the Bois de Boulogne.

The books are in an east room, on shelving of Circassian walnut, above which are medallion portraits on a background of gold—the whole bathed in a warm, tempered light from the glass-paneled ceiling. In this beautiful and expressive building, the whole effect of which, in its architecture and decorations, is to proclaim the spiritual greatness of its contents, are stored numbers of priceless manuscripts and rare books.

The collection and preservation of such relics of past greatness as these manuscripts seem properly the work of national governments. Mr. Morgan, besides gathering these unreproducible documents, has shown how they should be housed and cared for, in safety from fire and in an artistic setting.

The elder J. Pierpont Morgan was a connoisseur on his own account and he knew how to surround himself with those experts whose judgment was considered beyond criticism. His wealth enabled him to outbid many whose interest in the preservation of the great things of the past were no less keen than his own, but it was not individual ownership that he desired, so much as the collection and housing in complete security of objects up to his time subject to the hazard of purchase and sale. Instead of a scattering of old books and manuscripts under conditions not making for their preservation, he desired to care for them in one building under such auspicious circumstances as mark the existence of the Morgan library. The people of the future may therefore anticipate as much pleasure and benefit from their inspection as the people of the present enjoy.

The method whereby such a library can be made accessible to the public must in some respects differ from what obtains in a public library as the term is ordinarily understood. Asked a question relative to this, Mr. Morgan said: "The most important thing about a collection of this kind is to preserve it. If we want to do this we must throw safeguards about it or we defeat our purpose. You can see that a collection of this kind is not such as you can throw open to indiscriminate visitors. You cannot have large numbers of visitors going over these books. Think of it, one soiled thumb could undo the work of nine hundred years and a misplaced cough would be a disaster."

As you view the Morgan library from without, the crowning achievement of Charles F. McKim, regarded as the leader in Renaissance architecture, the imagination is stirred as to what may lie behind that wonderfully wrought entrance gate, said to be one of the finest pieces of work of its kind in the country. You are not long left in doubt as to the precautions necessary for the protection of these great treasures. A ring at the door brings the inner guard who, after duly examining the necessary credentials for admission, takes you into the presence of Miss Belle da Costa Greene, the chief librarian.

Exterior of Morgan library from East Thirty-sixth street.

As you slowly pass through the reception hall, looking first to the left and then to the right, wide-open doors afford glimpses of half-hidden beauties to feast the eyes, and the impression comes that this is an art institution rather than a library of books. The decorative skill employed in the interior soon fades from sight as little by little the visitor becomes conscious of the objects kept safeguarded behind the thickest of glass doors. The splendor of some of these ancient works in their wonderful bindings begins to fascinate the beholder. The craftsmanship there in evidence is little short of marvelous.

A book encrusted with jewels and set in gold stands alone in its case in Mr. Morgan's private study. A gorgeous thing requiring extreme care, this volume is no less than the Golden Gospels presented by the Pope to Henry VIII, together with the title of "Defender of the Faith" in appreciation of Henry's book in defense of the Catholic church. Its text is written in gold on vellum stained with Tyrian purple. A gold and jeweled manuscript cover near by is decorated with the gems which are said to be those a niece of Charlemagne gave to the church when she retired to a nunnery. Pearls and clear stones—red, green, blue and white—are set here in pedestals which rise half an inch above the gold and silver. It is a rich relic of a fine old barbaric age. Of a later date are the jeweled covers of the Ashburnham Gospels, whose splendid craftsmanship is believed to show the influence of Benvenuto Cellini. Cellini is otherwise represented in the library by a bust attributed to the master and by manuscripts in his handwriting.

The Morgan collection contains the masterpieces of great artists who raised bookbinding to one of the fine arts. Many of the examples have the richest historical associations. A fine work in leather by Clovis Eve covers a Ptolemy's geography which belonged to Mary Queen of Scots. There is much material in the library relating to women who were unfortunate in wearing a crown. A sheaf of letters in the handwriting of Marie Antoinette tells the story of her vicissitudes. These letters speak of much that occurred during the last three years of her life and were written to the Count Mercy-Argenteau.

But it is perhaps on some old and tattered leaves that the imagination dwells in preference to the dazzling richness of the more obviously precious items.

The contents of these manuscripts are of great interest. They are in Coptic, or medieval Egyptian, and were written by the monks of the Monastery of St. Michael the Archangel, at Payum in Egypt. These Coptic manuscripts were one of the last and greatest acquisitions of the elder J. Pierpont Morgan.

"These manuscripts were dug up by Arabs in a dry well connected with the Monastery," said Mr. Morgan in commenting on the relics. "My father heard of it and was able to buy the whole collection in 1911. It had been the custom of the Arabs, on finding manuscripts, to tear them up into separate leaves, distribute them to the whole population of the village and let them sell them. Luckily it was possible to buy these as a whole."

These Coptic manuscripts fill sixty volumes and have recently come back to the Morgan library from the Vatican where for years they have been carefully restored under the eye of the Pope who started the work of reviving the tattered pages while he was Monsignor Ratti. The Pope himself is one of the greatest living authorities on early Christian manuscripts and his interest in the Coptic collection was intense. He put the best manuscript restorers in the world to work on them. Parts of the original were so ragged and faded that it seemed impossible that they could ever be read. These were stiffened with gelatin and the writing cleared up so that nearly all of it can be read.

Ten complete photographic copies of the sixty volumes have been made and deposited at the chief libraries of the world. The great interest of scholars is in the differing versions of the New Testament and other Christian literature which is found here. As a contribution to the study of early Christianity it is the opinion of scholars that the Coptic manuscripts have no equals. They are beautifully illustrated and the style of the pictures forms a connecting link between ancient and medieval painting.

What, after all, may be considered the greatest literary treasure within the Morgan library? To answer this is difficult. The range is so wide, time and distance have been such contributory causes not only for the preparation but the gathering of these accumulations of man's written word that to hazard an opinion would be but to have someone else make a different choice. The late Theodore Roosevelt said that to him the greatest thing in the library was this letter by Lincoln:

> Executive Mansion,
> November 13th, 1861
>
> Hon. Secretary of War.
> My dear Sir:
>
> Please have the Adjutant-General ascertain whether 2d. Lieut.—— of Co.—.—— infantry, is not entitled to promotion. His wife thinks he is. Please have this looked into.
>
> A. Lincoln.

With regard to documents bearing on the history of the United States the Morgan collection stands in the front rank. There is, for instance, a three-volume compilation of letters that refer to the Siege of Yorktown, including the letter Cornwallis wrote to Washington proposing a cessation of hostilities, really the British official notice that the beginning of the American victory was at hand. There is also a great collection of letters that Washington wrote. No one seems to know just when the elder Morgan's interest in the Washington correspondence took its start, but with regard to the Valley Forge letters it is believed that their accumulation began some time in 1883, giving evidence that the founder of the library turned to Americana as his first choice when entering upon the quest that has borne such rich fruit.

Other Presidential documents are autograph letters of Grover Cleveland, while Roosevelt is represented by the manuscript of his autobiography.

Imposing view from entrance of the Morgan Library.

A corner in the study, illustrating characteristic blending of art and literature.

In one corner of the room which was Mr. Morgan's private study is a door with heavy bars and braces—plainly the entrance to a vault. And a vault it is, lined with bookshelves which hold collections of priceless original manuscripts and letters.

Mr. Morgan took from the shelf a little volume and opening it, he remarked simply: "A Christmas Carol." It was indeed Dickens' great little masterpiece. "And Scrooge and all the rest of them are in there also," he added.

Considering what pleasure and comfort "A Christmas Carol" has furnished men and women, boys and girls, since the days when Dickens penned the immortal words, there are those who feel that no greater literary treasure rests between the four walls of the Morgan library. Again we see demonstrated that after all it is not the gold and glitter that constitute the real treasures of mankind, but that which goes deeper into the consciousness, that touches the heartstrings of humankind, of which "A Christmas Carol" is so striking an example. With all that the ancient manuscripts may mean to the scholar bent on discovering the links that united the past with the present, some of the things nearer our own time have the power to move us even more strongly because of our better understanding of a genius who, like Charles Dickens, gave expression to the emotions that stirred the common human heart.

Manuscripts of the works and correspondence of American, English and Continental authors in the library total 905 volumes. There are about 7,000 signed letters and documents, unbound. As for autograph manuscripts, the collection is vast and varied. Here you see Keats' manuscript poems. There are the three volumes of Emile Zola's "Nana," the only Zola manuscript not in the Bibliotheque Nationale at Paris. George Sand is represented by "Les Dames Vertes"; Alexander Dumas by portions of his "Le Vicomte de Bragelonne"; Victor Hugo with "Journal de Pexile." Boswell's letters to Temple from 1758 to 1794 form a valuable part of this collection, as does Lamb's "Dissertation Upon Roast Pig," and many of his letters. The complete manuscripts of Thackeray's "The Rose and the Ring," "The Virginians," "Denis Duval" and "Lovel the Widower," together with the original drawings, are other choice bits kept under lock and key except on such special occasions as this to tell the world what is here preserved for posterity.

Of other English authors whose manuscripts have been collected here some of the outstanding names are George Meredith, John Stuart Mill, Thomas Moore, Campbell and Johnson, whose "Life of Pope" is considered a special literary treasure. Among the American writers occur such outstanding ones as Edgar Allan Poe, Walt Whitman, Thoreau, Hawthorne, Whittier, Holmes, Lowell, Bret Harte.

The great collection of Bibles, ancient and of later days, may be considered among the most notable in the Morgan library. There are just thirty shelves of Bibles—three Gutenbergs (Mazarins), one of paper, the others on vellum; the Hebrew Bible of 1482; all the English Bibles from the Coverdale onward; Bibles owned by celebrated personages, such as Colbert's, in thirty-two volumes, with the statesman's arms on the cover; Mme. de Maintenon's; Sir Walter Scott's; Bibles in Icelandic and other strange tongues; a set of the Gospels in ten volumes, exquisitely bound by Padeloup.

Of other religious relics the list includes the Gospels of Mathilda, Countess of Tuscany, written and illuminated between the years 1055 and 1115; leaves from a "Bible Moralisee," written for and containing the portraits of Blanche of Castile, and her son, Louis, about 1230; the Huntingfield Psalter; a manuscript written and illuminated in England about 1170; the "Windmill," Psalter, dating from about 1280; the Tiptoft Missal, from around the year 1332. There are more than 200 French Bibles, Psalters, Gospels and Service books, dating from the VIII to the XVII century, including the "St. Louis Bible," the only known complete manuscript of the Bible, in French, of the thirteenth century. A number of the manuscripts contain full-page pictures in red, yellow, green and brown, depicting such scenes as the Annunciation; the Virgin and Child; St. Michael and the Dragon; Martyrs, Saints, Anchorites, and so forth; and very often a large Calvary Cross of interlaced design, the spaces between the arms being decorated with sacred monograms or symbolic animals.

The extensive collection of Incunabula, comprising books printed before 1500, includes the only specimen in America of the earliest dated piece of printing, the Indulgence, dated 1455, of Pope Nicolaus V. issued to such persons as should contribute money to aid the King of Cyprus against the Turks; also, the first printed book, the so-called Gutenberg or First Bible, printed at Mainz before 1455. Of even greater importance, according to collectors, is the Great Psalter printed at Mainz by Fust & Schoeffer, successors to Gutenberg, since it is the first book to bear a date (1459). The Morgan copy, printed on vellum, is the only one in America.

As you turn from the Bibles to the other side of the great room, what an array of Caxtons and Wynkyn de Wordes greet the eye! See those Elizabethan and Jacobean first editions. Practically everything is here—Shakespeare folios and quartos, Sidney, Spencer, Johnson, Sir Thomas Browne, Marvell, Waller, Burton and hundreds of others. There is also the manuscript of "Paradise Lost," of Keats' "Endymion," Shelley's notebook, Pope's "Essay on Man," Lord Byron's "Don Juan," "The Corsair," "Marino Faliero," Burns' "Auld Lang Syne," "Mary Morrison," "Comin' Thro' the Rye," "Tam O'Shanter," "The Cotter's Saturday Night," Scott's "Waverly," "Ivanhoe," "Anne of Geierstein," "Old Mortality," "Guy Mannering," "The Lady of the Lake," and Scott's own journal. It is said that not even the British Museum can match the Morgan collection of Caxtons.

It is claimed, and with good reason, apparently, that there has never been a complete description of the contents of the Morgan library. The only article known in print dates from 1908, since which time there have been many additions made both by the elder Morgan and the son from whose hands there now passes to the public this great storehouse of knowledge.

The library, as has been said, will be maintained primarily as a work place for scholars and scientists. It will not be open to the casual sightseer, since that would defeat the end in view. Those gaining access to the precious volumes will have to show proper credentials. To all such the collections will be available. The viewpoint that these books now belong to the world of letters and not to a private family will be observed throughout, with the safeguards so necessary in a case where the future even more than the present is at stake.

Indictment of Easel Art by Workaday Artists

The World Wants Peaches—Modern Art Offers It Persimmons Instead; Creative Genius No Longer Works to Definite Specifications

By MORGAN D. E. HITE

MY FRIEND, Roland Darkert, who is an artist and a thinker, was speaking. We were together at a late afternoon luncheon in the Comus restaurant where silk-shaded lights glowed on tiffanized walls and snowy damask cloths. Sitting in the subdued light of a side aisle, at a table-for-two against a wall, the conversation had turned—as it usually did with Darkert—to art and esthetics.

"Have you noticed that art today seems to be thought of as something distinct and apart from everyday activities?" Darkert asked. "That is to say," he added, "it is deemed to be something out-of-the-ordinary, instead of being, as it ought to be, the most ordinary thing in life. Do you want to know what is the trouble, that is to say, what I believe is the trouble? Easel art is the matter with art."

"What is easel art?" I asked.

"Easel art is that kind of a work of art which has been created solely according to an individual artist's own whim and fancy, something evolved from his own desires without consulting the wishes of others, a kind of art, strictly individualistic, if you will, brought forth by the initiative of the artist himself, expressive solely of himself, a one-sided baby, so to speak. The easel artist abhors the idea of bringing out something made to order, that is to say, as the expression of some other individual, community or race. Easel art is the kind that is not made to measure, not made to order, not made to fit a given place or to fulfill a given purpose. Easel art is the kind that is made, on the contrary, to suit best the artist's own comfort and idiosyncrasies, accommodated to himself alone, with only one chance in ten thousand of a meeting between his piece of easel 'art' and its most fitting place and purchaser."

Easel Art Once a By-Product

"IN OTHER words," said I, "you would imply that the three factors should always go together—artist, place and use, and purchaser?"

"Yes, I mean just that—artist, use, buyer, and the work of art itself are one and inseparable, and that they must be a unit or the work will fall short of being true art. That is what is the matter with easel art—it is detached, and the only things I know of in the world that are detached, unrelated and purely individualistic, are dead things. Nature soon eliminates them from the scene.

"Easel art's detachment will remove it in due time and real art may have an opportunity to breathe again. The world is suffering now for the stimulus of art which is lacking in our everyday concerns, because easel 'art' has had unchallenged possession of the popular mind."

"Well, I think I begin to see why 'art' is unpopular in this age and generation," I returned, "that after all the popular disregard for art and artists is founded on a true instinct of the people that most so-called 'art' and 'artists' is just one more form of 'spoofing'. . . . Who invented easel art, anyway?"

"The present-day conception of art," replied Darkert, "is an outcome of the Renaissance period, when in addition to the magnificent opportunities extended to the artists of that time for doing work *in situ*, in place, such as frescoes, monuments, architectural works, the fashion of painting individual easel portraits, portable pieces without special requirements of use or place, was developed as a by-product. Hitherto the work done by the art workers was in every case integral with and a definite part of the building or space it occupied. The detached painting was almost as unknown as the detached statue, mosaic, altar or column. Up to that time all art work was done to order, to definite specifications, ordered in advance, each piece being the co-operative result of art worker and owner, such as we see today in the relation of architects and the owners of the buildings they plan for them, and architecture appears to be one of the few surviving arts. All the rest degenerated, until we witness the multitude of works of every description poured forth in the present age, representing individualism at its maddest, whimsies, erotics, temperamental. The modern 'artist' works without restraint of any kind. He has license without limit. That is what is the matter with him. The greatest artists of the past worked under the severest kind of limitations. The modern artist is 'free,' on the other hand."

Spiking a Popular Misconception

"AND let me say," added Darkert, "that the urge of the artist, the urge of a human being to create art, should be under control, its efforts directed into the best possible channels instead of frittering away on aimless productions of easel art. The modern artist—and mayhap his progenitors of the past centuries—is asserted to be loose in his love ties, and to disregard marriage relations, and his 'temperamental' actions are condoned. It is supposed to be the 'natural' thing for artists to act so, a part of the general license seemingly granted to them because they are 'artists.' Fortunately there is a class of artists who lead matter-of-fact lives, have happy homes and raise regular families, and particularly true is it so not only of the art workers of the present time who labor industriously day in and day out to fill orders given them in advance for art creations, such as the architect; but it is true of the greatest artists of the present day and likewise of the past, that they were 'family men,' devoted husbands, matter-of-fact in their business affairs and generally men of everyday plain living. The neurotics, individualists, and temperamentalists that we see today in the art world are a new tribe, something new under the sun. What they need is reasoned restraint, and the diversion of their ability into useful art work—into any channel except the wild freedom of easel 'art'."

"Darkert!" I exclaimed. "You would class the easel artist with the Fijian or Bushman, as one who is unequal to the possession of full citizenship rights, unfit for self-government?"

"I would say that the more powerful the urge of a thing in a human, and the more necessary, the more civilized a thing it is, it is more in accordance with nature's line of evolution, and more in keeping with the dignity of the human race, to put on artificial curbs and restraining influences. Great forces should be harnessed, and in mechanical things the human race recognizes this and puts it into practice with a new invention every day.

"Great urges in human beings should likewise be harnessed and diverted when and as needed. Salt is a wonderful thing—but it must be used in small pinches only. Too much individualism, license, lack of restraint, in an artist is the same as putting too much salt in our food. The use of salt, or anything, no matter how meritorious, must conform to our actual requirements. The work of the artist comes into this category. He must be reduced to a useful instrument of society by making him a willing, nay, an enthusiastic slave to the limitations of actual life. It can be done. Witness ancient and medieval art, and the best of modern architecture, and the wonders of modern mechanical genius."

The Utilitarian Viewpoint

"WOULD you imply, Darkert," I asked, "that it is the nature of art to be utilitarian, that art necessarily must have, to be true art, a strictly utilitarian basis?"

"Work of the human hands, if it is to be classed as true art," he answered, "must fulfill an actual requirement of a community, a nation or a large section of the human race. That is why you will see certain works of ancient or modern art widely received by all those minds which have a common communal, national or racial heritage, and rejected or accepted negatively by others to whom the heritage is not common. The artist cannot produce a universal work of art, that is, I mean something which has an absolute universal appeal, because of basic differences which inhere in different racial and communal and national groups, but most of all and chiefly because of the fundamental racial differences, which are such as to break the human race as a whole into several distinct parts. But within any given racial unit, where there is a common meeting ground of minds and the way of looking on life and the world, the artist may have scope to produce a work of art with a 'universal' appeal, that is to say, restricted within these wide limits. But to make the appeal it must be grounded on some common experience of the communal, national or racial unit in question, and not on the casual appeal of isolated souls. The common experience of a community or a race is intensely practical, at base utilitarian, and any work of man which is to gain influence or glory must have this common appeal.

"How many works of *easel art*," and here Darkert leaned forward and almost thundered, "have this universal, this common appeal! On the contrary, works of most of the artists of today pass neglected and unappreciated for the very reason that they are addressed to 'Nobody, Nowhere,' unless it be to the artist himself and no other!

"That is what is the matter with easel art—it is made by the artist to please only himself! The selfishness of this modern-day art is colossal. 'Temperament' is only one of the outcroppings of a selfish nature, and no one is so full of unrest, dissatisfaction and aimlessness as those who are most selfish in the world. The truest artist, on the other hand, is well balanced, generous, reasonable, and has so much respect for the rest of humanity, for his community, that he limits his productions to those things solely and best fitted for those around him. The persuasion and the reason of his art is to raise civilization's eyes to the purest heights of beauty—which may be truth for all we know—that within him resides. To do this much he had done the utmost that lies within human scope, to lead gloriously while serving faithfully . . . . But does the present-day *easel artist* do this? Rather he wants to lead while unwilling to serve. There is nothing reciprocal in his nature. They go on and on, these easel artists, desperately producing things, and pitifully starving, if need be, things for which there is no demand because they fill no real need. They grow persimmons, as it were, for a world hungry for peaches."

"But, my dear Roland," I interjected, "let us go back a little on this subject, to where you implied that artists produce great work only to specification, and that doing so they are therefore immediately appreciated by the world. What about Keats, whose work ranks as great work, and who in his brief life suffered cruelly, received little appreciation for the work which he did and which the world now acknowledges to be the truest kind of art? Yet Keats did his work on his own initiative, probably for his own pleasure, 'easel art,' as you would call it. Would not this imply that easel art has possibilities of its own, even though I may grant your argument that art made specifically for a time and a place has prior claims?"

What About Those Others?

"CUDGEL your memory," said Darkert, "for more examples like Keats. And then I will try to answer this phase of the problem."

I cudgeled, as it were, for more outstanding instances of a like nature with the wonderful boy, Keats. Fleeting names passed through my mind, such as Aubrey Beardsley, Poe, Chatterton, Stephen Crane, but one and all, with the possible exception of Chatterton, had seemed to retrieve something of success and celebrity, recognition, before they died. I began to note with a glimmer of intelligence at the fact, that names of artists of ancient times and of the Renaissance who died without recognition were totally absent from my memory, and for the first time it occurred to me that perhaps there were none such, that artists in those days never did any work unless they were given orders for their work in advance, and this, of course, meant that they secured recognition, appreciation—and payment—in their lifetime. The artistic tragedies of modern times have few prototypes in history! I began now to see that the worth-while pieces of art which have come down to us were designed, in by far the largest part, for a given place or given purpose, and for some exacting or relentless owner, and done to order, to exact specifications, with a time limit."

"Keats," replied Roland Darkert, "is perhaps the exception that proves the rule. Whistler, Corot, Turner, these, like many hundreds of other easel artists, did come into some decent form of recognition and reward during their lifetime. They produced something which met adequately some definite human requirement, and had to endure only that slow process which precedes success, and suffered the fate of the young man in any profession, who must grind ceaselessly and strive endlessly upward, persistently, before receiving recognition from the public. The professions recognize the truth of what I am saying, that years of hard, hard work must pass before the young man can build, first, public confidence, a character; and second, a reputation for good work, for the world is canny. Keats, had he lived, would sooner or later have achieved a wonderful success, as no doubt would have Chatterton, who also died so young. The others you had in mind, like Beardsley, Crane, Poe, each attained to some success and fuller recognition during his lifetime, and at the time of their passing out, the further success of each was assured.

The Instinct of the True Artist

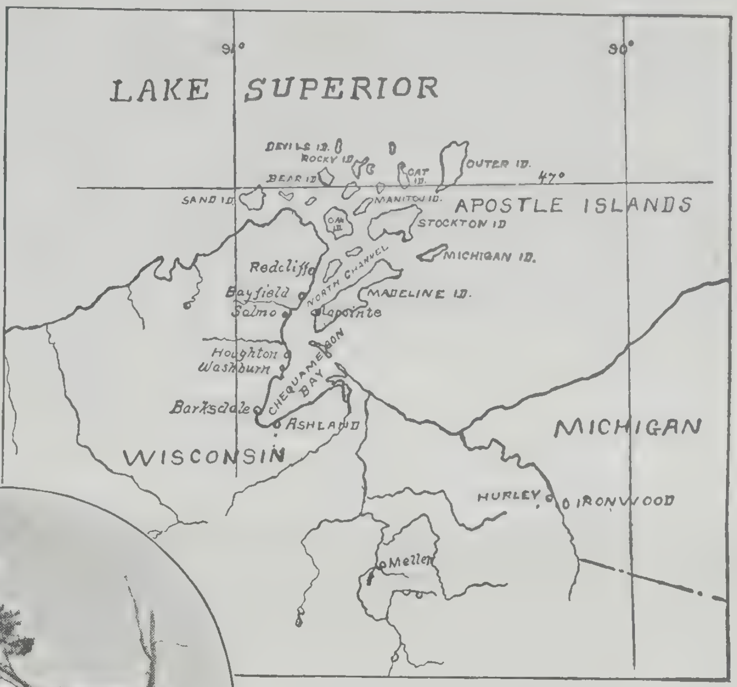
"BEARDSLEY indeed was not an easel artist, but did nearly all of his work for specific needs of his—clients, shall I say? He did his work in his own way, nevertheless, but to fit given requirements, very certain limitations. In producing 'The Raven' Poe laid down for himself certain extraordinary limitations and requirements, and unquestionably 'The Bells' was produced in much the same way. Poe was not an easel artist in the sense that I have applied the term to the modern-day average artist.

"Now, just how an easel artist can continue to be an easel artist and yet step into the charmed circle of the true artist, as all of those just named have done, and answering your objection, it is simply because the stuff they produced met the ten thousandth chance that I spoke about a short time ago—met the one chance in ten thousand where or when the work they did seemed as naturally in place or as fitting in time as a pea in its pod. When such work meets the ten thousandth chance it is fully equivalent to having been done satisfactorily to order. When a *true artist* works as an easel artist—for his own personal satisfaction or for lack of a client to give him an order—he will sooner or later come into his own, because the true artist has a true instinct for the needs and requirements of his people. His instinct and his public's needs are as one, integral. Hence his work meets a ready reception and, given the necessary time to build his reputation, his reward is sure.

Apostle Islands: Gateway to Old Northwest

Enchanted Lands of the Coureurs de Bois and the Jesuit Missionaries

By FRED L. HOLMES

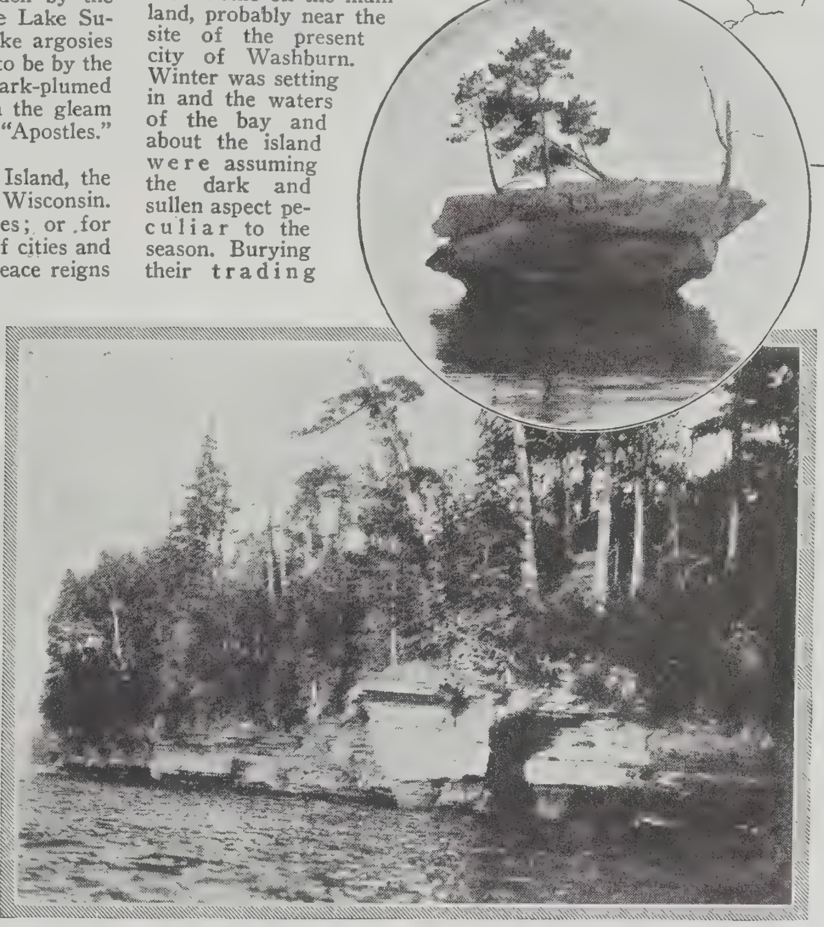


Map showing Apostle Islands off the northernmost tip of Wisconsin.

A CRAGGY shore line, sea caves and red stone cliffs, picturesque grottoes with pillar after pillar of variegated stone, high white columns of lighthouses, dazzling villas planted like tents under curtains of verdure—this is a glimpse of the enchanted Apostle Islands off the shore of Chequamegon Bay in Lake Superior.

The approach up the ascending Bayfield peninsula of Wisconsin thrills a visitor, like the glamour of childhood stories upon entering a fairyland. Viewed from the mainland, the Apostle Islands, one of the earliest spots in the Northwest to be trodden by the feet of white men, lay anchored in the blue Lake Superior waters, bathed in an afternoon sun, like argosies of green. Twelve islands there were believed to be by the early explorers, who first visited these dark-plumed lands of evergreen, irregularly streaked with the gleam of white birches. So they named them the "Apostles." Twenty-two islands there are in reality.

In summer, La Pointe city, on Madeline Island, the largest of the group, becomes the Lucerne of Wisconsin. Visitors throng to view its sculptured shores; or for quiet and rest far from the dust and smoke of cities and the noise of a commercial world. Sublime peace reigns in these isolated lands.



Above—Lone Rock, Bass Island, glistens from afar off like a green-mantled boat. Below—The Bayfield shore line off the Apostle Islands is rugged and picturesque.

Legend and history abound in these remote places. Before Columbus discovered America, the Ojibwas had made Madeline their island home. Still later the lands became the northwest gateway for zealous French explorers and trappers; for pious "black-gowned" priests seeking converts in the wilds, and then as an early commercial outpost of the Astor fur company. Long since the Indians were moved to reservations after an internecine warfare for years with the tribes on the shore. But the stories of their daring and bravery, their trials and vicissitudes linger, rehearsed by old island residents on their porches during the cool summer evening with the solemnity of a gospel reading.

The collective name of the Apostle Islands is at least two centuries old. Based on information gathered by Charlevoix, a noted Jesuit missionary, who in 1721 visited the western country as an agent for the French Government, this name was placed on a 1744 map. The first English traveler to note these islands was Jonathan Carver. He coasted the shore of Lake Superior in 1767 and published a map in his "Travels," applying the name "Apostle Islands" to the group.

Governor Lewis Cass, of Michigan, and James D. Doty, afterward territorial governor of Wisconsin, were probably the first Americans to make an official tour to this locality. Their visit was in 1820. At that time Henry R. Schoolcraft, later a distinguished Indian agent at Sault Ste. Marie, who accompanied them, attempted to rename the islands after several of the states in the Union. His proposal was not generally followed, although the present names of York and Michigan islands seem to remain as a part of his suggestion.

It is apparent that the early traders did not see each of the separate islands. Since the principal mission was named "Mission du Saint Esprit," the name of the twelve islands which they had counted appeared appropriate. Strange as it may seem, not a single island of the group bears the name of an apostle. The individual names of many of the islands have been taken from their outward natural characteristics. Outer Island explains itself, as do Ironwood, Oak, Basswood, Sand, Rocky, North and South, Twin, Bear, Wild Cat and Otter. Raspberry Island takes its name from the Raspberry River which empties into Lake Superior. Devil's Island and Manitou Island are both the same name. Hermit Island and Stockton Island have taken their appellations from their early inhabitants. Madeline Island received its name from the wife of an early trader, Michael Cadotte. The island was frequently known as St. Michael's, from the given name of Cadotte, who was the principal trader on the island for many years. Its Indian name was Moningwanekaning, supposed to mean "the place of the Golden Breasted Woodpecker." By the name of "Woodpecker Island" it is often referred to in story and song.

Probably the most remarkable scenery is to be seen along the shores of Outer, Devil's and Bear islands. At Bear Island, if one cares to penetrate the shore, is the great brown stone bathtub hewn from the foundation of the island by the force of the waves.

There are no characters in American history more picturesque than the first two adventurous fur traders to visit the Lake Superior region—Pierre d' Esprit, Sieur Raddison, and his sister's husband, Medard Chouart, Sieur des Groseilliers. In their fond desire to "travel and see countries" and to be known "with the remotest people," they roved through the country of St. James Bay and Central Wisconsin in 1655 and by many able historians are believed to have discovered the Mississippi River twelve years before Marquette. Five years later they are found exploring the Lake Superior region, skirting the shore of Chequamegon Bay, visiting the famous "Pictured Rocks" on the banks of Michigan peninsula.

Within full view of the Apostle Islands, they made their home on the mainland, probably near the site of the present city of Washburn. Winter was setting in and the waters of the bay and about the island were assuming the dark and sullen aspect peculiar to the season. Burying their trading supplies, doubtless on one of the islands, they spent the winter on a hunt with remnants of the starving band of Algonquin Indians in the Mille Lacs region of Minnesota.

A white-columned lighthouse on Michigan Island, one of the Apostle group.

In 1665 the first missionary, Father Claude Allouez, reached the locality. For four years he labored alone with the Indians, attaining little success amid the greatest of hardships and privations. Father James Marquette, a more youthful zealot, was sent to relieve him in the autumn of 1669. Here it was that he first learned from the Indians about the mighty Mississippi with which his name will be linked through the ages. Soon trouble arose among the warring Sioux and their neighbors, with the result that Marquette and a band of Hurons were forced to retire to Mackinac. It was 1835 before Mass was again said on the tree-mantled shore overlooking the Apostle Islands.

Within this interregnum a panorama of noted fur traders passed in an historic procession. Sieur Raudin, the personal representative of the impetuous La Salle, came cajoling the Sioux in 1673; Daniel Graysolon du Luth, after whom the city at the head of the lakes is named, followed in 1679; Le Seur in 1693 to build his stockade on Madeline Island and other notable traders who were to leave an imprint upon the early history of this enchanted land.

After the fall of New France, an English trader, Alexander Henry, spent the winter of 1766 opposite Madeline Island and formed a partnership with the Cadotte family. About the opening of the nineteenth century, Michael Cadotte took up his abode on Madeline Island, and from that time to the present it has been permanently occupied. In 1830 Frederick Ayer, of Mackinac, visited the island and opened what was then the only Protestant mission on the shores of the Great Lakes. Five years later Father Frederick Baraga established a Catholic mission there, just one hundred and sixty-four years after Marquette had been driven from Chequamegon Bay by war parties of the western Sioux. The old "mission house," which he built in 1841, was recently destroyed by fire.

Little wonder, with all this early history dramatized by the fiery words of Parkman, that the Apostle Islands should be a place of historic remembrance. But even the romantic and fabled story of trials and disappointments, of strivings for power and control, the rise and fall of kingly domain in the Northwest, pale into comparative insignificance when the islands themselves are visited. Long ago as a schoolboy I had traced the line of advance of these first traders and missionaries, but it was never so indelibly imprinted until one autumn afternoon I motored over the peninsula to have the dreamland of a quarter of a century made a reality.

Before me the great lake was calm as a mirror, silvery in the light of a noonday sun. First one island and then another came into view upon the blue haze of the Lake Superior background. Here was the gateway of the Northwest.

Each of the islands had some especial peculiarity; some grotesqueness of outline or sculptured shore which differentiated it from the entity. Madeline Island, the largest of the group, is the only one of the islands that is settled. It is reached by a little steamboat, which makes daily trips to LaPointe, a prosperous community for tourists.

The inhabitants of the remaining islands are limited to lighthouse keepers, and a few summer campers, several of whom have been coming to the locality for more than a quarter of a century.

Madeline, "Queen of the Apostles," is a treasure spot of romantic interest. Indian legends make it the foundation stone of Mother Earth. Among them there is a story that "Winnebozho," the first white man, had a quarrel with the "Water Spirit," who ruled the floods, in consequence of which the Spirit determined to drown him. The waters were caused to rise so that they covered the whole earth. But supernatural powers were also possessed by "Winnebozho," and when he saw the flood advance he went to the pine tree, and climbing into its topmost branches, commanded it to grow as fast as the mounting tide. Finding his efforts fruitless, the "Water Spirit" then allowed the waters to subside. After the twelfth sun the surface became calm and still and "Winnebozho" descended. Around the tree trunk an otter was swimming, seeking safety. "Winnebozho" lifted him up and after he had rested him in his arms, told him to dive down and bring up some earth that he might create land. Trial after trial was made, but the otter could not reach bottom. As he had given up, a mink came swimming along, but his efforts were also unsuccessful.

Still "Winnebozho" was not discouraged. Seeing a muskrat paddling about in the waters, he took him up, and breathing into his nostrils, told him to go down and bring up earth, or never to come back. The rat swam swiftly down, and after a terrible struggle below

(*Concluded on page 14*)

Apostle Islands: Gateway to Old Northwest

Concluded from page 13

floated up, lifeless, on his back. "Winnebozho" picked him up and found in his black claws some grains of sand. Restoring the animal to life, he took the sands and blew a strong breath upon the grains, scattering them at some distance over the surface of the waters. Every grain began to grow and multiply and soon the grains became islands. It was thus that the lands were originated and one of them, "Madeline," became the hunting ground of "Winnebozho." As the muskrat saved "Winnebozho" it has since been the favorite animal of the Ojibwas.

Several miles out from the Wisconsin shore line near the city of Bayfield, at the north end of Chequamegon Bay, lies Madeline Island, a succession of great land waves. It is a beautifully wooded island, twelve miles long and three miles wide. Fine summer homes line its western shores and a number of farmsteads have been carved out in the interior. Autumn makes it a haven for hay fever sufferers.

It is La Pointe, old and historic as a city on the island, which attracts attention. A long dock comes out from the water's edge; one long shady street traverses the town; farther on is the old Indian cemetery, and then at the deep bend in Crescent Bay are the beautiful grounds of the old mission. The air, pungent with the scent of evergreens, the paths of the village, the byways through the land seem to be permeated with its legends and romances of a day when the Indian and the trader held heyday in the land.

Rich in Indian Tradition

ACCORDING to tradition, the Ojibwas settled on the island about 1490. They had been driven westward by their ancient foes, the Iroquois. They rested for a time at Mackinac, and then moved on to the Apostle Islands. Soon they became adept in the handling of the canoe and were able to escape from their enemies on the shore. It is estimated that at one time 10,000 Indians of the Ojibwa tribe made their home on Madeline Island. The waters about abounded in fish and great flocks of wild pigeons came in the early spring and autumn. Here they lived for 120 years unhampered by their enemies, their camp fires never smothered.

Then came a sudden change. Their desertion of the island home is one of the sad, romantic chapters in the story of the islands. Among these Indians there grew up a strong group of medicine men, known as shamans, who demanded every year the sacrifice of an Indian maid. The Indians, steeped in superstitious fear, reluctantly acceded to their demands. Once the maidens were given up, they were never again seen. It remained for a dusky Indian lover who had been robbed of his sweetheart to solve the mystery. Spying on the medicine men, he learned that they had slain his sweetheart, had taken her body to the medicine lodge and were roasting it for a feast.

Arousing the young braves, he led them against the shamans, destroying their lodges and murdering the cannibalistic feasters. Among the Indians there grew up a superstitious fear that the spirits of the murdered maidens haunted their homes and hovered menacingly over the island. Women heard their cries in the night and warriors saw their faces in the clouds. Panic seized them. In fear they fled to the mainland. By the year 1620 the island was entirely deserted. Some migrated far north into Canada and Northern Minnesota, and the Ojibwas or Chippewas who are there today are the descendants of the tribes who never returned to their island homes.

Years afterward some returned. For them fear lurked in their footsteps. Whenever they passed the big stone, near the cliffs, where the shamans were supposed to have murdered the maids, they would scatter tobacco on the rock and waters to appease the angry spirits.

The scene of life in the Northwest was about to shift. Soon thereafter came the traders and missionaries, and again Madeline became a place of pulsing interest.

Devil's Island, which, according to the Ojibwa legend, was the prison of "Matchie-Manitou," the evil spirit who was confined there by "Kitchie-Manitou," the great spirit, has its surprises—among them being the most picturesque sea caves of the group. The island is a huge block of Potsdam sandstone rising from forty to fifty feet above the water level, the land covered with a dense evergreen forest. Resisting the force of three hundred miles of sea, during the passing centuries, the waves have honeycombed the solid walls into great chambers, expanding arches and fantastically carved pillars. A rowboat can pass through these connected caverns several hundred feet, the cold, moist corridors narrowing and expanding from passageway to chamber.

The Hermit of Wilson's Island

"DURING the terrible storms that periodically sweep over the great chain of lakes, these caverns become seething caldrons, and the rushing waves dash into them with almost resistless power," declared an old resident of Madeline Island. "Often when the storms are at their height, the spray from the sea, beating against the rocks below, is thrown against the glass of the lighthouse lantern, forty feet above its base, while the roar of rushing waters is like deafening thunder, and the island itself is shaken to its very foundation."

Near by is Presque Island, known on government maps as Stockton. Third in area, it stands out boldly in the watery mirror with several miles of high frowning walls, crowned with moss-seamed battlements, along its north and east shore line. Centuries of rain and storm, sunshine and frost, have fashioned these stone ruins to resemble ancient castles. A rocky sentinel, known as the "Sphinx," guards the entrance to one of the dells, whose walls tower from forty to fifty feet in height. Sheltered in one of the grottoes is the little musical waterfalls, the Silver Cascade. The wave-nibbled shore line seems like a beguiling cavern to a fabled fairyland.

Two miles away is Hermit or Wilson's Island. Shortly after the American Fur Company had settled at La Pointe, a stranger appeared at the post. He made a few purchases, lingered about the place for a few days, and then disappeared. A month later the Indians reported that the stranger was erecting a log hut and making a clearing on an island. Soon he had a large garden for cultivation. Twice a year he visited the fort, bought his supplies, paid for them in Mexican gold and silver and then departed. His money caused a comment among the inhabitants and it was whispered that he was possessed of fabulous wealth and had a hidden treasure on the shore. Seldom was he visited except by the Indians. One day they reported at La Pointe that he was dead. Investigation disclosed that he had been murdered for his money. Among his effects were found a number of books, both in French and English, indicating that he was well educated. In a clock, overlooked by the assassins, a canvas bag was found. It contained forty-four Mexican dollars and a few gold pieces, which the authorities used in defraying the expense of his funeral at La Pointe. Thereafter the island was known as the Hermit's Island.

A few miles west of Oak, between Raspberry and Steamboat islands, is Sand Island with its great sea arch made famous by the celebrated American landscape painter, Bierstadt, who visited there in 1878. Fable and fancy have connected them with other thrilling romances.

As we left the islands the sun was setting over the Bayfield peninsula, bathing the anchored ships of green in a flood of golden light, mirroring their trees and shore line in the deep blue of Lake Superior. Far off a freighter was steaming past on its way toward the "Soo," a reminder that the paths of civilization are near these enchanted islands of beauty and peace.

Gold Standard "Dead as Mutton"—Keynes

Concluded from page 6

at great expense, that the value of gold shall conform to that of the dollar." (pp. 213-215)

On the "fell and furious" toll exacted by usury Mr. Keynes writes with an illumination rare in expositions of real-politics. Thus he writes:

"The active and working elements in no community, ancient or modern, will consent to hand over to the bond-holding class more than a certain proportion of the fruits of their work. When the piled-up debt demands more than a tolerable proportion, relief has usually been sought in one or the other of two out of the three possible methods. The first is Repudiation. But, except as the accompaniment of Revolution, this method is too crude, too deliberate, and too obvious in its incidence. . . . The second method is Currency Depreciation, which becomes Devaluation when it is fixed and confirmed by law. . . . In Germany the National Debt has been by these means practically obliterated, and the bondholders have lost everything. In France the real burden of the debt is less than a third of what it would be if the franc stood at par; and in Italy only a quarter. (p. 71) . . .

"The remaining, the scientific expedient, the Capital Levy, has never yet been tried on a large scale; and perhaps it never will be. It is the rational, the deliberate, method. (p. 72) . . . . There is a respectable and influential body of opinion which, repudiating with vehemence the adoption of either expedient, fulminates alike against devaluations and levies, on the ground that they infringe the untouchable sacredness of contract, or rather of vested interest, for an alteration of the legal tender and the imposition of a tax on property are neither of them in the least illegal, or even contrary to precedent. (pp. 73-74) . . . Nothing can preserve the integrity of contract between individuals, except a discretionary authority in the state to revise what has become intolerable. *The powers of uninterrupted usury are too great. If the accretions of vested interest were to grow without mitigation for many generations, half the population would be no better than slaves to the other half.* Nor can the fact that in time of war it is easier for the state to borrow than to tax be allowed permanently to enslave the taxpayer to the bondholder. Those who insist that in these matters the state is in exactly the same position as the individual, will, if they have their way, render impossible the continuance of an individualist society, which depends for its existence on moderation. (p. 74) . . .

"Experience shows with great certainty that the active part of the community will not submit in the long run to pay too much to vested interest, and, if the necessary adjustment is not made in one way, it will be made in another,—probably by the depreciation of the currency." (p. 77)

"Easy Money" Alecks No Longer Fester Europe

By WALTER M. WOLFF

MISSISSIPPI Bubbles, rat ranches, goat farms, and Panama oil wells are not the only methods used to court Dame Fortune. The "wise guy" does not buy promotion gold mine stock in Alabama nor does he waste much time with perpetual motion machines.

A particularly fertile spot in 1922 and 1923 for all seekers after easy gain was the new German Republic, fighting desperately an uphill battle to prevent the mark from rolling off altogether into nothingness. It suddenly became possible to spend one's stable currency in a country where one dollar meant four or five dollars and a pound was worth four pounds as if touched by the fingers of Aladdin. Germany became the very cheapest, most inexpensive nation in the world in which to live and a considerable part of the migrating world packed up and came to Germany for an indefinite and comfortable sojourn. But there were many indeed who preferred to see the fun from their front porches. These individuals merely placed an order with their bankers for so many dollars' worth of German marks and then figured up to see how much profit they would make when the mark should get back to normal once more. But if these German-Americans and other stay-at-home "wise ones" would only have bought Czech crowns or Italian lire, or, best of all, have kept their tidy savings of gilt-edge American dollars, all would have been perfectly blissful. As it is or was, a grand total of more than ONE BILLION dollars changed hands and German mark "investors" are still holding the sack into which no snipe will ever run. However, like all snipe-hunting contests, it can be reported that a good time was had by all—except by the snipe hunters themselves.

When a Bargain Is Not a Bargain

ONE man who left his sister at home in New York thought he could get away with something if he sent back to her at regular intervals small parcels or envelopes containing gold leaf which he bought for paper marks at much reduced prices. The sister is bothering American consuls and the customs agents in Germany to this day in an attempt to secure a release of the confiscated parcels. About this time it was a grave offense to send more than a very small amount of currency out of the country. It is not known just how much cash was actually seized by the German postal and customs officials but place the figures well ahead of six ciphers in the dollars column.

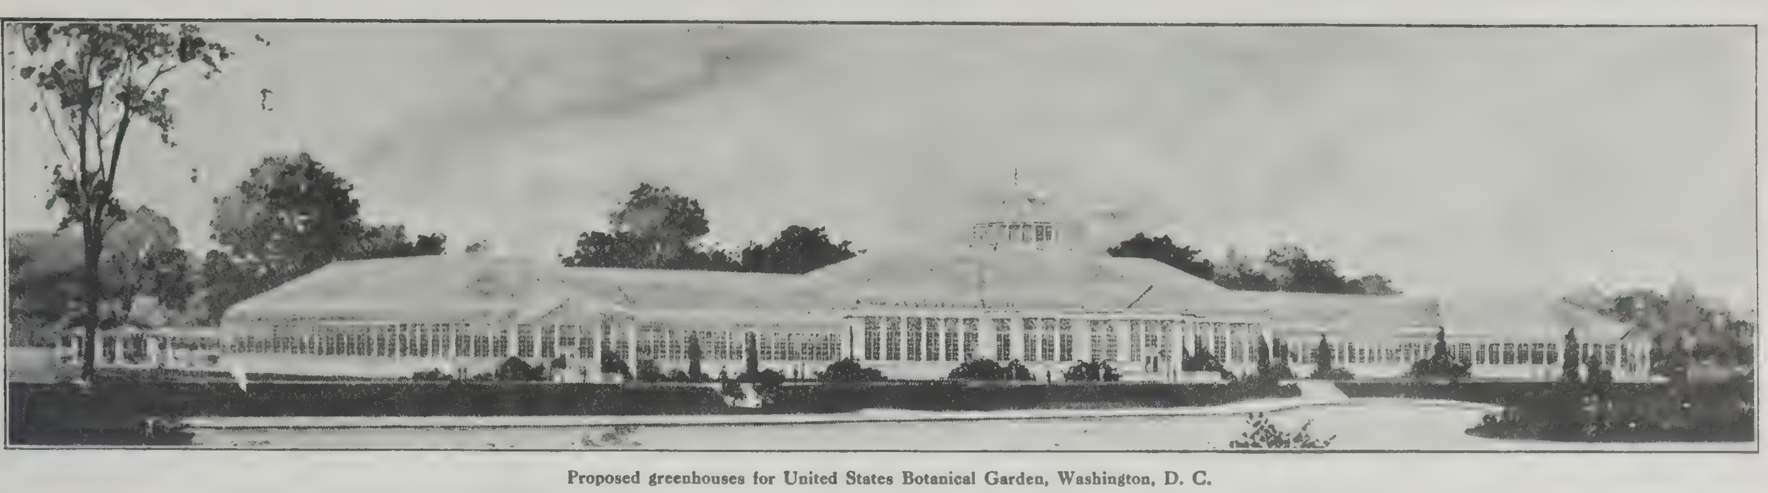
Every other Tom, Dick and Harry in Germany during the halcyon "harvest" days loaded himself up with all sorts of articles which he expected to take back home with him and dispose of at a neat profit. But one redeeming grace saved the Germans from complete commercial annihilation. This all-saving grace worked like a boomerang to the invader after he had filled his bags and prepared to leave. Everything went smoothly until the victim approached the border, wheresoever that border may have been. Here the German officials shone like a bellboy's brass buttons and the general outcome of every inspection usually meant that most of the "bargains" were left behind and the purchasers proceeded on their way with only a slip of paper to show what had been left behind. Very often, in cases where direct violation of the law was evident, the "wise guy" also departed minus fifty dollars or seventy-five dollars which were exacted from him in fines, and he could congratulate himself that he got off without a prison sentence in most instances. The law in the matter was clear and specific: an export permit from the customs officials was necessary *in every case* before goods were allowed to leave the country, immaterial whether toothpicks or traveling bags were involved. The fact that people overlooked the *every case* clause cost them very dearly, for very few of the confiscated goods have to this day been returned and then only after diplomatic or consular intervention in most instances. For those individuals who supplied themselves with an export permit beforehand, matters went on very smoothly but these "fortunate" persons usually paid enough duty on what they bought so that they found themselves bringing home articles which were often not as cheap as the home product.

"Never Again" Says the American

BUT we will not suppose for a moment that everybody was caught red-handed and punished accordingly. Not at all. So many goods were smuggled out of Germany successfully that even the stories about daring rum-runners seem tame in comparison. Everything contraband crossed the border in a thousand different ways, but by far the greatest number of lawbreakers were caught very soon after attempting a get-away. The eagle-like watch on the German frontiers prevented anything like a big haul from leaving the country unmolested.

Another little stunt which was worked upon the German populace was that of passing or circulating old Confederate currency and also counterfeit American bank notes. Not a small number of Germans accepted these spurious bills and became suspicious of every foreigner who crossed their thresholds thereafter.

Today Europe is no longer the happy hunting grounds for the "soft snap" seeker. Not even the reports of the falling French franc arouse the "wise guy's" avarice nor does he lose much sleep over the matter at all. The "wise guys" of this generation are all back home, likely as not bigger and better Americans for their experiences. There will be no "next time" for them and so much the better for posterity!



Proposed greenhouses for United States Botanical Garden, Washington, D. C.

Uncle Sam's Plant Museum, Washington, D. C.

Unique Botanic Collection Begun One Hundred and Four Years Ago

ON THE eighth of May, the United States Botanic Garden will celebrate its one hundred and fourth birthday. Few spots in Washington attract more visitors than does this garden of Uncle Sam. For, in spite of cramped conditions and dilapidated conservatory, the garden has preserved a remarkable collection of plants and has distributed throughout the length and breadth of the United States countless thousands of trees and flowers and ornamental shrubs to beautify and adorn American homes.

In early American history we find that George Washington contemplated, among other projects considered by him for the Federal city, just such a botanic garden. It was the subject of correspondence between him and the commissioners of the Federal District. The commissioners, writing Washington on the first day of October, 1796, discussed

> "The disposition of the public grounds in the city, and having already recommended sites for the national university and mint, they add that the establishment of a botanical garden has been lately suggested, and if the site proposed, which is not named, does not meet with the President's approval that a portion of the national university site can be devoted to that purpose."

In his reply of October 21, Washington decided the site for the university, and stated further,

"Conceiving (if there be space sufficient to afford it) that a botanical garden would be a good appendage to the institution of a university, part of this square might be applied to that purpose. If inadequate, and the square, designated in the plan of Major L'Enfant for a Marine Hospital, is susceptible of that institution and a botanical garden also, ground there might be appropriated to this use. If neither will admit of it, I see no solid objection against commencing this work within the President's Square . . . ."

However, nothing definite was done until May 8, 1820, when Congress granted the use of five acres for a botanical garden, and four years later, May 26, 1824, extended the area of the grant.

Among the original ideas in establishing the botanical garden we find that "The collection, cultivation and distribution of plants were proposed in the interest of medicine, foods and the arts and industries, and as it was the living plant that was sought, their care and growth required a botanic garden. . . ."

From the very beginning the Botanic Garden has had difficulty in obtaining finances. At first, Congress seemed practically content to grant the five acres of land. Friends of the garden contemplated a lottery (they were frequent in those days) as a means of overcoming their financial difficulties. Upon the granting of the five acres it was placed in the care of the Columbian Institute for development. The idea of a lottery was finally abandoned, and a plan of selling public lots adopted.

The Metropolitan Society in June, 1816, proposed to apply "to Congress for the appropriation of 200 acres of ground, called the 'Mall,' which was designed in the original plan of the city for a public garden. In this place it is proposed to cultivate the plants and seeds which may be presented to them; and as they multiply, to distribute them throughout this extensive continent." It was also later explained that the garden might be used to cultivate all kinds of indigenous trees, shrubs, roots, grasses, and so forth, to be distributed to every part of the United States. "Beautiful, shady, cool walks may be formed, yielding a pleasant and healthy means of recreation, and the science of botany be improved and encouraged."

In August, 1830, one Francis Barnes made a most unusual proposition to the Institute, and, due to the financial difficulties that were being encountered, it was even favorably considered by some of the most influential members. Mr. Barnes wanted to lease the garden for a term of years, and he intended to be recompensed by charging fees to visitors. He proposed to make some kind of pleasure garden out of it, although he was not quite definite as to the kind of amusement he intended to provide. His proposal contemplated the taking care of the plants and the cultivation of plants and seeds, beautifying the garden and keeping it in good condition.

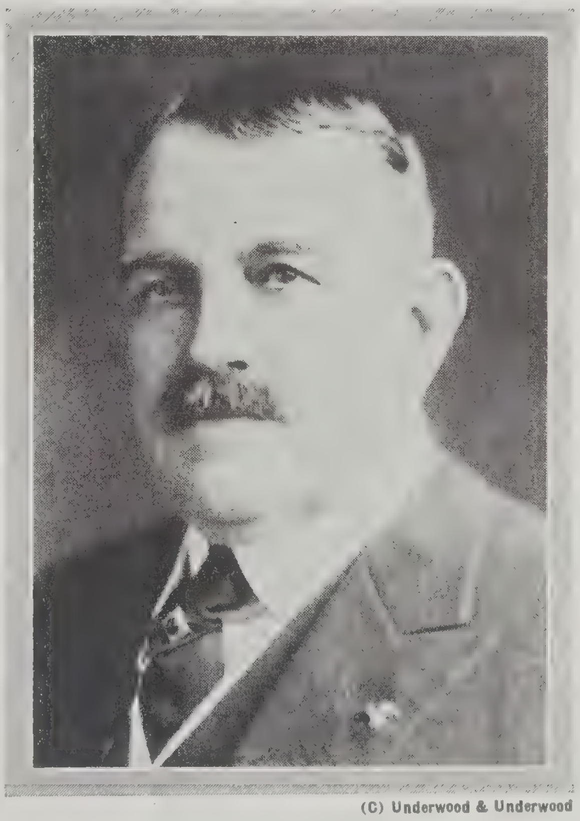
Indeed, the United States Botanic Garden is a development that has been continuously beset by difficulties. Numerous incidents and points in its history are interesting, but what of the garden today?

The plants in the Botanic Garden come from all parts of the world. The first collections were abandoned by the Columbian Institute during the thirties, the garden was required by the government to provide accommodations for the collections of the United States Exploring Expedition to the South Seas, 1838-1840, which had been deposited at the Patent Office as they had been received in Washington.

At first, small greenhouses had been built at the Patent Office. These became inadequate and public agitation finally resulted in the transfer of the greenhouses and plants to the site of the former Botanic Garden, where they have since remained. This collection of the expedition to the South Seas constitutes a very important group of the plants now owned by the government.

The Botanic Garden is under the direction of George W. Hess, who not only has to be a botanist, but a diplomat as well. He was brought up with the soil, and has worked in various public gardens all over the country, some of which obtained their principal supply of plants from the United States Botanic Garden. He is an expert on Chinese plants and knows their names in Cantonese dialect.

There is great lack of room in the present garden. You may walk into one of the greenhouses and there find six rows of beds, with passageways almost too narrow to pass through. All available space has been used. You will see 40,000 plants in one propagating bed that you would think could hold only half that number. There is a continuous process of shifting and changing to make room, out of the propagating beds into pots, and as soon as the weather will permit the young plants are set out in the nursery.



(C) Underwood & Underwood

GEORGE W. HESS.

Plants from all over the world are found in the collection. The Hottentot poison tree which bears a small fruit, purplish like a small plum, the fruit and sap of which are both very poisonous and used in making poison arrows, is an interesting specimen. It is also called the ordeal tree because its fruit was given in a broth to the accused; if he died, he was guilty, if he lived, innocent. There is a bamboo that often grows a foot in twenty-four hours; the Gamboge, a tropical fruit out of which is made artists' colors and yields medicinal products; spice trees, mahogany trees, Indian Bread Fruit; the celebrated Bena, or the "fish-tail" or toddy palm, which is used in Colombia and the Philippines in making intoxicating beverages of a percentage clearly outlawed by the Eighteenth Amendment; banana trees, the Papaw—a melon fruit tree, all the fruit being borne on the female tree.

Out in the garden, on the approach to Maryland avenue, is a European Hornbeam tree alleged to have been planted by Abraham Lincoln. It is declared to be one of the finest specimens of this tree planted in America. Just to its right is a Cedar of Lebanon. Within a few minutes you can walk over the entire garden, yet you will be astonished at the variety that has been packed into such a small place.

When one considers that the plants and flowers cultivated in the United States Botanic Garden are at the beck and call of four hundred and thirty-five Congressmen as well as ninety-six Senators, it is easy to understand why it is necessary that Director Hess should be a diplomat as well as a botanist. Since Congress failed to appropriate last year for the distribution of seeds and plants by the Department of Agriculture, it has thrown an added burden upon the Botanic Garden, because if a Congressman cannot get votes by sending garden seeds he will insist upon "saying it with flowers."

So, if you go down to call on Mr. Hess you will be lucky if you do not have to wait until some Congressman or his secretary gets through explaining his "requests" and the exacting demands of his constituency. Naturally, the supply of plants is limited, and the director's diplomatic powers are often tested in an effort to satisfy every demand and yet keep within his possibilities.

There are many social occasions among the Congressional set that demand flowers, and again the director is called upon to furnish the decorations. He always meets the demand and usually succeeds in getting most of his potted plants back into his greenhouses again, since they are only loaned for the occasion.

At last it begins to appear that Congress is going to recognize the needs of the Botanic Garden. The plans now contemplate an $800,500 new conservatory. (The old one built in 1867 is in bad shape and in danger of falling down. It is closed to the public.) Recently Congress has authorized new lands for the garden and it is now proposed to open up all the land in a direct line down to the War College and the Potomac River. If this plan is carried out the Botanic Garden will become one of the real beauty spots of Washington and will be a credit to our nation.

A report of progress made to the society on December 6, 1823, stated:

"The ground for the garden has been completely drained and partly leveled, and is in a great degree fit for cultivation. An elliptical pond has been formed 144 feet for the transverse and 100 feet for the conjugate diameter, with an island in the middle 114 feet by 85 feet. The canal that surrounds it is fifteen feet wide and two and one-half feet deep. There is also a drain from the spring leading to the pond through the center of the ground, and from the pond to Tiber Creek, with a conduit at the lower side of the pond by which water can be either let into, or out of, the pond. At high water and a spring tide, two and one-half feet of water flows into the pond, which can there be confined by putting a plug into the bore of the log; or the water can be nearly all let out and kept out."

A visitor to the Botanic Garden today would recognize no such spot.

In the garden is placed the imposing Grant Memorial. Just why, it is hard to say. All that can be said for the present site can be outweighed by the statement that the Grant Memorial should be set upon some imposing eminence where its real grandeur and beauty can be appreciated, not stuck down in a bottom hedged in by objects that obscure its artistic magnificence. The Memorial to General Meade is now being erected in another corner of the garden. These are mistakes in taste, errors in judgment, which sooner or later must be corrected.

BRIEFLY TOLD

Archeologists excavating on the site of ancient Carthage have found, among other things, a pair of spectacles of the third century B. C., and in a Punic tomb, a terra cotta figurine of an organ, pots of rouge and face powder, bronze razors and milk bottles.

An old Spanish proverb applicable to the present is "Truth and oil will come uppermost at last."

The Pullman Company has posted the following bulletin in certain of their sleeping cars: "Strangers who invite you to play cards generally are too lucky for the average mortal." This warning is emphasized by a picture showing the corner of the ace of clubs sticking out of a player's pocket. Officials report the Florida runs have had more robberies by card sharps this year than at any time during the last twenty-five years.

America's first helium reserve, comprising 7,100 acres of gas-bearing lands in Emery County, Utah, has been created by President Coolidge on recommendation of Secretary Work, the man appointed by Coolidge to take Albert Fall's position. This land is known as Helium Reserve No. 1, and will be closed to public settlement, location, sale or entry. Except for a few prospecting permits, issued about three years ago, the mineral title to the land is vested in the government.

Karl Wittig, famous bicycle rider, gave such an excellent demonstration at the Paris velodrome that he was called upon to do an extra lap "for honor," a request usually reserved for victors in races that they may receive the plaudits of the audience. The race was won by a Swiss, Paul Suter, who rode sixty-nine kilometers, 980 meters in an hour.

A modern lumbering concern in Oregon is using six-inch square timbers as rails in short-line logging railroads of a temporary nature.

By having "dummy" Ecuadorean and Peruvian concerns first obtain concessions and prospecting permits, British oil companies are said to be rapidly gaining a commanding position in the potentially fertile petroleum fields of these two South American countries, which experts believe will, in a few years, become two of the richest oil-producing sections in the Western Hemisphere.

Mahatma Ghandi is fifty-six years of age.

The Triangle Theater is an underground theater in New York City where professional actors, temporarily at leisure, try out plays. Membership to the theater is open to all lovers of art and there are many players who are persons of the literary and artistic world.

The railroad system of Germany is the best in the world, according to the report of the Dawes Commission.

The Afghanistan Government employs a great deal of labor, which is organized in military fashion. Gangs of workmen march to and from their work in military formation. The entire country resembles a private feudal estate and the Amir's word is law.

"The International Jew," a four-volume series on the Jewish Question, may be obtained from The Dearborn Publishing Company, Dearborn, Michigan. This set includes:

"The International Jew," Vol. I, 235 pages; "Jewish Activities in the United States," Vol. II, 256 pages; "Jewish Influence on American Life," Vol. III, 256 pages; "Aspects of Jewish Power in the United States," Vol. IV, 246 pages. The price of these volumes is twenty-five cents each; the complete set, four volumes, one dollar.

BINDERS

Readers who desire to save their copies of The Dearborn Independent can now obtain a specially constructed cloth covered post binder. This binder is very practical, holds 52 issues and permits immediate reference to or removal of any copy without disturbing any other issues. Price $2 each delivered. Remittance must accompany orders.

A law passed during the time of Napoleon is being revived by the French to save Paris from Broadway advertising methods. The great electric signs around the Place de L'Opera are to go. The prefect of police has jurisdiction over exterior design of buildings in the vicinity of "historical monuments."

Of the ten cents paid for a loaf of bread, on the average, six cents goes to the baker, one and four-one-hundredths cents goes to the retailer, nine-tenths of a cent is given to those who haul the wheat to the mill and the flour from the mill to the baker. The elevator gets not quite one-tenth of a cent and the miller slightly more than half a cent. Producers of the wheat, the yeast, the salt and other ingredients get a little less than one and a half cents. The bulk of this cent and a half goes to the wheat farmer.

The desert areas of the United States are included within a great triangle whose base, 800 miles long, rests upon the Mexican border in California, Arizona, New Mexico and Texas, and whose apex is in North-Central Oregon.

The average person in the United States consumed fifty-three gallons of milk and cream last year, or 1.16 pints a person each day.

Hair from Chinese queues are stretched across a wooden frame in the mechanism of a fog buoy. The fog rolling in on the coast expands the strands of hair. This elongation of the hairs is sufficient to set in operation automatic fog bells, sirens and whistles, warning vessels off the rocks. When the fog recedes, the hair strands dry out, contract and close the valve, shutting off the signals.

A new instrument known as the electric telemeter records strains produced in bridges by trains or motor trucks passing over them.

In New Zealand the native Maoris living near the hot springs cook their food in the bubbling pools of boiling water. In the Whakarewarewa region there are geysers, hot springs and other volcanic phenomena, similar to our own Yellowstone National Park.

Australia is often described as a climatic paradise. It is a land of sheep and cattle, wheat and corn; apples, grapes, peaches and figs, pineapples, cocoanuts and bananas. The climate is tropical, alpine, temperate and uniform.

The average farm wages in the United States last year were $33.18 a month with board.

The Alaska Railroad, the only railroad operated by the United States Government, will be self-supporting within another year, according to a statement made by the general manager.

Icebergs in the Atlantic steamship lanes are destroyed by means of high explosives.

The normal loss of sugar cane in Louisiana, caused by the sugar cane moth borer, is estimated at 570 pounds of sugar an acre.

Ramsay Macdonald married a woman with sufficient dowry to relieve him from all further anxiety. The trade unionists had far more confidence in Macdonald married and prosperous than in Macdonald the needy.

Disdaining to give up his ship and backed by his crew, Captain Charles Williams, seventy, of Cambridge, Massachusetts, steered his vessel, the *Brina P. Pendleton,* for ten days without a rudder after the schooner had lost her steering apparatus in a gale. A sister steamer offered to take off the crew but they stuck to the vessel and by manipulating the sails, they zigzagged through gale after gale to Norfolk, Virginia, Harbor.

White salmon, dyed and sold as high-grade salmon, has been found by the Federal government inspectors in Philadelphia.

The eight voyages of the *Leviathan,* beginning with the maiden voyage last July, have been at a net loss of $70,897.87. This is exclusive of the costs of repairing the ship's recent mishaps.

Mayor Kendrick, of Philadelphia, will play no more Sunday golf, according to reports. He is said to have told a Philadelphia pastor that he could no longer conscientiously play Sunday golf, because he felt, as a city official, he should set an example by obeying all laws.

"If we continue to put fear at the helm and folly at the prow, we shall steer direct for the next war."—*Mr. Leach,* the British Undersecretary of War.

Elias Liebermann, literary editor of the *American Hebrew* and chairman of the department of English in New York public schools, has been made principal of the new Thomas Jefferson High School, which will be the largest in the country.

CHRONICLER OF THE NEGLECTED TRUTH

"The Red Clydesiders" Are Not So Wild

Bolsheviks May Be Disappointed in British Labor "Extremists" From Scotland

Newspaper reports startled the world by asserting that Bolshevism had come to Scotland. While, perhaps, not so revolutionary an assertion as that prohibition had come to the land of the haggis, it seemed so utterly at odds with Scottish character as to call for examination. The present article presents the facts as they are. The writer is an informed British journalist to whom Clydeside is more than a name. A point he does not emphasize is the religious character of the Labor leaders of Great Britain. Time and again the influence of John Wesley has been credited with giving the English workingman his admirable balance between effective protest and lawless violence, and the Scottish workman has cultivated strong character on his diet of catechism and kirk. Bolshevist ideas have been sown at the cost of tens of millions of dollars in Britain and America, but have brought forth no harvest in action. The fact is significant and the explanation is this, namely, that superior racial soils do not nourish the inferior seed.

By THOMAS C. TAYLOR

"THE Red Clydesiders!" The glib phrase has come over the wires frequently of late. It has been seized upon with avidity and unconcealed delight in radical quarters here. One hears it rolled in spouting triumph from cosmopolitan tongues in the byways of Manhattan; and on the pages of some of those publications which circulate (some surreptitiously) in languages other than the language of the United States it has been given a prominence and significance which suggests that upon the Scottish Labor members of the British Parliament great Bolshevik hopes are set. Elsewhere there has been engendered a feeling that behind the cautious Premier Ramsay Macdonald there is a reckless group of "wild Scotsmen" bent upon driving him by all sorts of dangerous and even catastrophic short-cuts to the Socialization of Britain and the spread of Bolshevik influence.

It has been patent to close observers of the performance of Britain's Labor Government during its few weeks of office that Macdonald's chief preoccupation has been the consolidation of the position won by Labor in popular favor. Behind every move has been preparation for the next election. When Soviet Russia was placed in the position of announcing that Great Britain had decided to take the paw of the Bear, the "recognition" rejoicings were somewhat chastened in character when they came along, the reason being that Russia's present controllers were quick to realize that the "recognition," actuated by Britain's need of trade and work for her unemployed, settled not one of the questions outstanding between Britain and Russia. It gave British industry and finance an opportunity to attempt to re-enter Russia and take some risks and exert some influence; it placed the respective administrations on speaking terms; but the actual speaking has yet to come! The move strengthened Labor's position in Britain. Macdonald may leave the talking to others.

A Naval Program for Wages, Not War

SIMILARLY, the grim facts of unemployment in Britain constrained Macdonald and his Labor brigade to antedate the naval program. Work, plentiful and immediate, is the great need there; and in proposing warship construction at once the Labor government had in mind not *war* but *wages*. By the way, the Conservatives could hardly have withheld support from Labor in that matter. They had already antedated construction for the sake of the unemployed, as one at least of the 1,925 ships was well under way on the Clyde long before the last election! Labor gained in general prestige by that decision, however, and, be it suggested, made an important electoral advance into Liberal territory.

Having skillfully shelved the capital levy question, and reassured financial interests thereby; having indicated that he is not going to be altogether neglectful of the fact that in British opinion means of national defense cannot yet be ruled out as superfluous; and having indubitably improved the atmosphere enveloping Britain's foreign relationships, Premier Macdonald has "made ground" for Labor in Britain, it is generally admitted there, and sowed an impression of common sense, sane, clean dealing.

What, then, of the Labor men from Scotland, those "Red Clydesiders" whose every extravagance of utterance is hailed with equal delight by the Bolshevists and by those who are awaiting the development of a British reaction against Labor? Is this new broom—this broom of tough Scottish heather—so keen to get on with the sweeping that it is failing to grasp the fact that its handle is held by non-Labor hands?

There are points of much interest in the question, and informed consideration of these is not likely to bring any comfort to America's "Reds."

The uncompromising earnestness of the contingent sent by Scotland to Parliament has to be taken account of in all that they say and do. Men of the people, with personal experience of the blighting conditions which have been the lot of the mass of Britain's population since 1914, impatience of delay toward what they regard as ameliorative action is to be expected of them.

For the first time in its history, however, British Labor has been confronted with the slippery track that lies between electioneering and governing. It is learning that, after all, its own country may not always be wrong, may not always be the laggard in progress, and may even be right occasionally. Its education is proceeding apace; however, it has been electioneering for thirty years and governing for only thirty days or so. Old habits cling. Withal, these Scots are practical men, and unlikely to do more than to insure that the ideals of Labor are kept clamantly before their leaders, and to guard against the danger—to them, a very real danger—of the party heads being enmeshed in the net of tradition plus precedent plus form plus departmental routine which is calculated to hold and tame the wildest of the wild reformers entering the ancient precincts of the Mother of Parliaments.

Personal acquaintance with practically every member of the Scottish Labor group enables the writer to indicate to some extent the misleading qualities of "The Red Clydesiders" phrase, and to suggest that any hopes entertained by the radicals concerning the group so branded are doomed to disappointment. "The Red Clydesiders" are from constituencies which would immediately apply a distinct corrective to any display of that particular tinge of "redness" beloved of the Bolshevik. The Scots realize that *so far as this Parliament is concerned the British Labor Party, in actuality, has no binding program, and in their wider scope all Labor's big plans and projects are set aside meantime.* The formula employed by Ramsay Macdonald in putting the troublesome project of a capital levy out of the way can be applied effectively to every question or pledge or platform "plank" which might restrict Labor's chance of now remaining in office and proving to hesitant Liberals in particular and the world in general the capacity of Labor to govern: "We did not receive from the country a mandate for a capital levy any more than the Conservatives received a mandate for protection." The country may make its mind clearer to all parties at the next election, which Macdonald will welcome if it falls at a time when his record of administrative success remains undamaged, and before the jealousies which are the reward of every Labor leader have had time to weaken his party. There is less really loose talk from "The Red Clydesiders" than from other parts of the Labor lines where noise is more readily mistaken for intelligence than in Scotland.

David Kirkwood, the Irrepressible

THE "wildest" of "the wild men from Scotland" is understood to be that lively Clyde engineer, David Kirkwood, now quite an old Parliamentary hand, and renowned at St. Stephen's for a voice that will not be lost in a storm, and a most irritating habit of mystifying the House by dropping into the use of "the braid Scots tongue." Believing that the Great War had its origin in capitalistic ambitions, Kirkwood opposed war activities without fear, and was ultimately deported from his district. He came under the personal notice of Mr. Lloyd George in those days when, as Minister of Munitions, the latter came to the Clyde to talk to the workers. The right honorable gentleman was made rather uncomfortable on that occasion, and became conscious of his salary, at least, when the irrepressible Kirkwood, who presided, made the introduction to a gathering of workers who wanted more pay: "This is Mr. David Lloyd George, the highest-paid munition worker in Great Britain!" In that introduction is revealed the real Kirkwood, specialist in studied irreverence for "the little tin gods." There is one good reason why Kirkwood is in Parliament for an industrial district. He is, first and last, apparently, a class politician—Labor first, the rest "nowhere"; and he is absolutely sincere. There is a reason equally good, however, for his avoidance of Bolshevism as it is understood in Scotland. He and others assimilated thoroughly the important lesson which "Red Clydeside" furnished to all politicians in the dangerous early days of 1921: the lesson that Scotland, favoring progress, suffering from desperate ills wrought by war and subsequent financial manipulation, will not tolerate "rough-housing."

Other "Red Clydesiders"

BRITAIN'S Minister of Health, John Wheatley, a man whom his many friends regard as "a future Labor Premier," is another of "The Red Clydesiders," and, I learn, he has roared with laughter at the designation. He is uncompromisingly Laborist, a specialist in housing matters, and so impressed by Britain's dire need of housing for the people that he is not likely to allow any consideration of party expediency to hamper or retard him in that connection. His working life he began as a miner at the age of eleven, and was in the mines till he was twenty-two. He is now a publisher. He, too, has read adequately the character of Scotland in matters political, and he has had much experience of public life. To picture him as Scotland's Trotsky is funny. He is for homes, decent family life, a chance for the under dog. He is a "destructionist" in so far as the demolition of comfortable platitudes is concerned. He, in his forceful driving for housing, may even be the means of destroying the present government. His faith in Labor is unbounded; but the "Reds" must not number him with their elect, for he won't fit in.

Journalists figure prominently among "The Red Clydesiders." There is Dickson, who began his career as a pit-boy and won, very grimly, an experience which in later years contributed to brilliantly effective work as a journalist; a straight, clean thinker and warm-hearted family man. He is not a "Red." Another journalist, Johnston, editor of a long-established Scottish newspaper, has for years maintained a relentless attack upon the many British relics of feudal days which Labor regards as obsolete and not worth the money they cost. For example, Johnston, who has delved deep into family histories and has published the very interesting results of his researches, sees no adequate reason why the descendants of (let us imagine) a chef who catered to the gluttony of a king several hundred years ago, and was ennobled therefor, should be in these days a burden on the people, or should hold salaried office to which no duties attach, or should claim "rights" and privileges on sea-front and land which are unjust and absurd. Johnston, serious, idealistic, and a gentleman, is out to strip off the weed and the barnacles which have accumulated on the hull of the old British ship during the centuries, but he will do nothing to impair the soundness of that hull.

Maxton, teacher, journalist, sardonic and effective critic, is for "revolution by education," holding that if education be adequate there can never be any other kind of revolution, and progress will be inevitable and invincible.

These are "The Red Clydesiders." The radicals of America need expect little other than useful instruction on the futility of force from "Red Clydeside."

A Christian Church in the Ghetto of New York

St. Augustine's Chapel Engulfed in the Flood of Degraded Alien Influence

By CHARLES ALBERT COLLMAN

Chapel of St. Augustine, wedged in between tall buildings in the Great Ghetto of New York.

IN THE downtown section of New York's great East Side, there is a large block of singular shape, bounded by the Bowery, by Stanton, Chrystie and Houston streets. In the heart of the block there was once a Quakers' burying ground. On this site, fronting on the south side of Houston street, a short distance east of the Bowery, stands the impressive Chapel of St. Augustine. Even today, this building, structurally, is one of the largest church edifices on Manhattan Island. Imposing in its façade as in the immensity of its interior, it had the highest ceiling of any church in New York until the building of St. Patrick's Cathedral.

Some half-century ago, St. Augustine's Chapel represented the far-flung outpost of the Trinity Corporation, the great Protestant Episcopal parish of New York City, in its mission work among the large immigrant populations of Northern Europe, mostly of Anglo-Saxon stock, that were pouring into the metropolis of the country. This work was undertaken by a one-time curate of Trinity Church, the Rev. Dr. Arthur C. Kimber, who, assigned to the mission, hired a room over a saloon on the Bowery, and began such pioneer efforts that have in them the fruits of victory. His success in a short period was so great that Trinity Parish decided to build a chapel in this district.

The corner stone of St. Augustine's Chapel was laid September 2, 1876, and the chapel was consecrated on the Feast of St. Andrew, November 30, 1877, by the Right Rev. Horatio Potter, Bishop of New York. At the celebration of the two hundredth anniversary of the founding of the Parish of Trinity Church, New York City, in May, 1897, the Rev. Arthur C. Kimber, S. T. D., Vicar of St. Augustine's Chapel, delivered in that edifice on May 2 an address entitled "A Witness to the Faith," in which he said:

"It is evident that the history of this great parish is contemporaneous with more than two-thirds of the history of civilization in the United States. The parish was nearly a hundred years old when the independence of our great republic, the United States of America, was acknowledged. In this parish the vestry has always been composed of men noted for their high intellectual attainments and for their unquestioned integrity. It is not at all remarkable that the vestrymen of Trinity Church have always been the first citizens of the city."

At the time when this address was delivered, the organizations of St. Augustine's Chapel and Mission House included communicant classes, church instruction classes, and a Sunday school in which the officers and teachers numbered sixty-one, while the scholars aggregated 809. There was a sewing school with a membership of 465. There was a Parish school for boys, and a night school for young men and women in which the number of persons enrolled aggregated 124. There was also a house school and a missionary guild. That was twenty-seven years ago.

In the ensuing years this district became more thickly settled by an industrious people of the type that has added to the greatness and wealth of the country. Christianity had been their inheritance, and though there crept in those undesirable elements which may be found in the crowded quarters of all large cities, yet even they were scrupulous never to affront the near vicinity of a Christian church. Under the energetic and capable ministrations of Dr. Kimber, the influence of the Chapel of St. Augustine broadened to an unprecedented scope. It soon could boast the largest congregation on Manhattan Island, and had the largest Sunday school in the United States. The church and school attendance twice a day aggregated 2,500 persons.

The church was distinguished in many ways. Its tower was 266 feet high, although it has since been reduced some sixty feet, owing to the building of public improvements in the locality which it was feared might imperil its safety. St. Augustine's was the landmark of the neighborhood, and its great illuminated sign blazed its purpose through the district. It was the pioneer in instituting an illuminated invitation to churchgoers in the city. This sign was first lighted by gas, although electricity was later adopted. The interior of the church is still lighted with gas, but St. Augustine's was the first to introduce the attachment by which its great chandeliers were set alight by means of a spark instead of the cumbersome torch theretofore in use. Dr. Kimber died in 1909, and was succeeded by the Rev. Dr. W. G. Anthony.

The startling change in the character of immigration to this country first manifested itself on the lower East Side of New York and produced the beginnings of that immigration problem which has assumed such importance in the present day. Non-Christian peoples from Eastern Europe, principally from Poland and Russia, came in floods that augmented year by year. From Allen and Baxter streets their stream spread steadily northward. A large portion of these peoples had not even risen to that civilized plane where personal cleanliness is regarded as an essential. Streets and houses in the section were evil-smelling. Large families lived in one or two rooms, the tenements were hotbeds of immorality and disease. Here the "red-light" district was born, a product of the children of the Ghetto, who organized the infamous "cadet" system. Later followed the exposure of the "white slave traffic" scandals, whose scenes centered in Allen and Chrystie streets and adjacent thoroughfares.

The Christian populations that had settled on the East Side could not sustain existence in proximity to the newcomers, whose community appeared to them destructive of everything they held dear in life. They moved away as the foreign flood advanced. American shops and industries were gradually abandoned in this section, and the Christian churches that remained were called upon to deal with new conditions. Chief among these was the large chapel and Sunday school which the Trinity Corporation had founded in East Houston street.

REV. DR. L. D. RHODES.

Vicar of St. Augustine's Chapel.

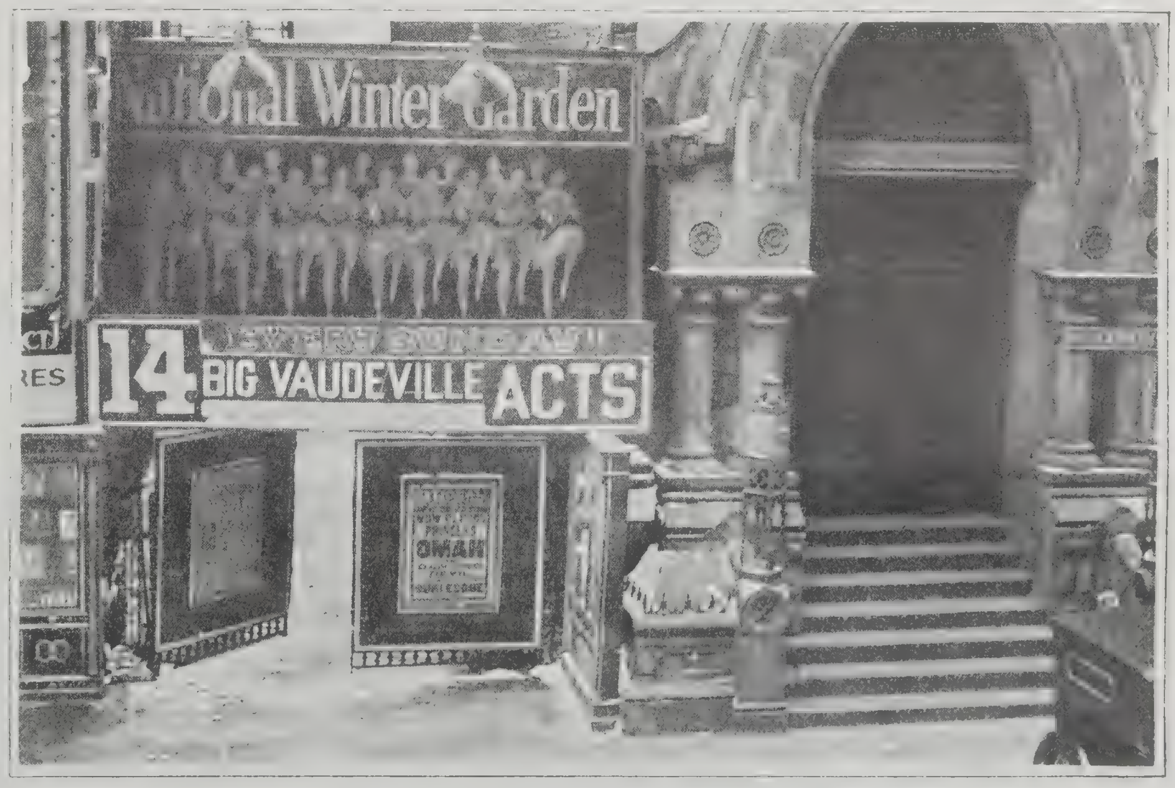
St. Augustine's Chapel was soon engulfed in the flood of the Ghetto. *Opposite the edifice, on the northwest corner of Second avenue and East Houston street, stood the notorious Cosmopolitan Café, which became the rendezvous of Leon Trotsky, then a radical agitator, and today the most prominent leader of the Russian Soviet. For years Trotsky was a well-known figure here, where he harangued great Yiddish throngs congregating on this corner at nights, on the principles of Communism.*

In the "Iconography of Manhattan Island," the monumental work on whose publication Mr. I. N. Phelps Stokes is expending a fortune, one can read the facts concerning the foundation of Trinity Church in 1697. Jewish refugees, then banished from other countries, out of gratitude for the shelter they had received in New York, contributed a quota toward the building of Old Trinity at the head of Wall Street. They were then few in number, but some 220 years later, with the Great Ghetto firmly established, they instinctively obeyed an impulse to affront the Christian church that stood within its boundaries. *A burlesque show of a degraded character was opened in the building immediately adjoining the Chapel of St. Augustine's on the east. The nature of the performances that are given here, and the efforts that have been made to suppress them will be dealt with later. But the salacious character of the photographs displayed in the windows, of the pictures exhibited on stands on the sidewalk and the posters which are deliberately placed on the wall of the chapel, are notorious throughout the district.*

The flight of the Christian population from this section soon made its effect felt upon the large congregation of the chapel, the attendance at the Sunday school and the membership of guilds and classes. The once flourishing St. Augustine's soon saw its record attendance dwindling until today the work which had been built up with such effort and enthusiasm in former years, has almost disappeared. *The opening of the Yiddish theater beside the church edifice has had its blighting share in all this, as was evidently intended that it should. Parishioners on their way to church, whether on week days or Sundays, are compelled to pass a place flaunting evil and debasing appeals, and it is no wonder that many parents have decided that their children shall not be exposed to such influences on their way to Sunday school, for the burlesque house continues its performances even on Sundays, under the pretense that they are "vaudeville concerts."*

The exact character which this district of New York bears in the police annals of today was disclosed a few weeks ago, when Police Inspector William A. Coleman,

(Concluded on page 13)



The National Winter Garden advertising its burlesque "show" alongside the Chapel of St. Augustine in East Houston street, New York City. Note how the posters are placed against the side of the Chapel.

Older Than King "Tut"—Pyramids of Mexico

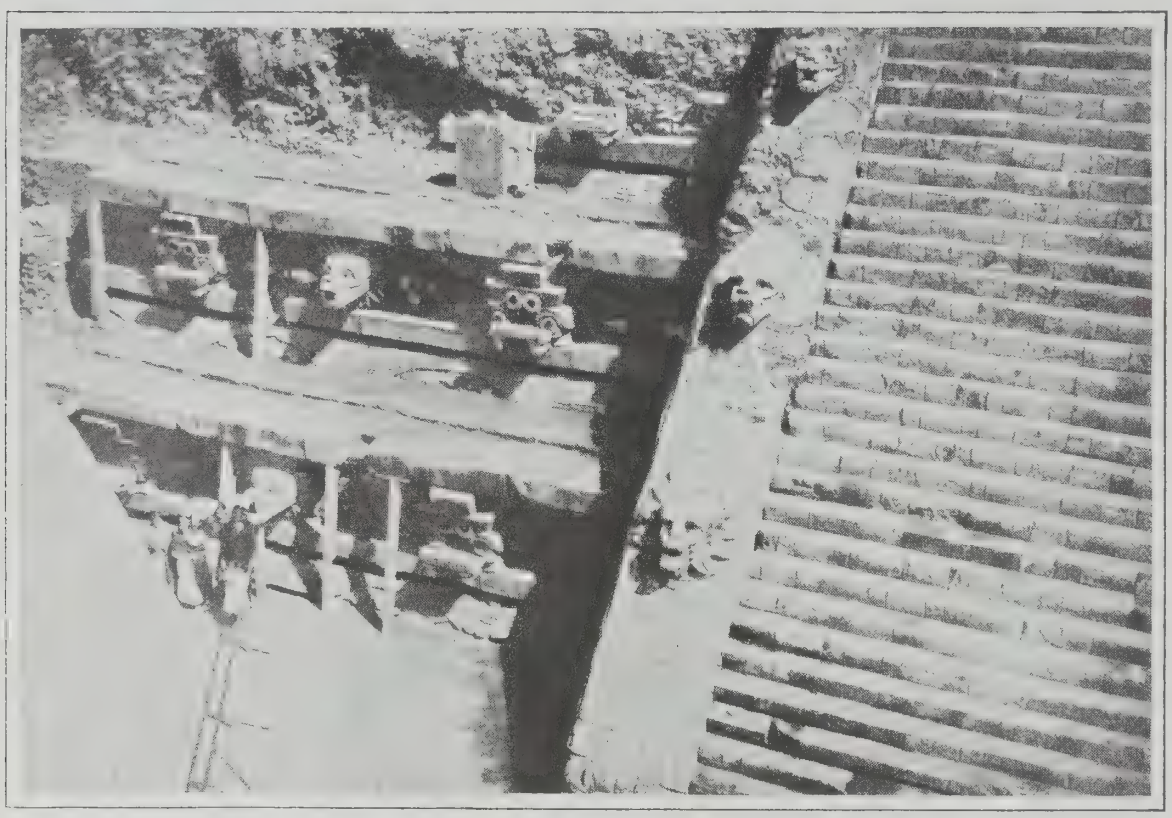
Marvels of the Past Just Four Days South From New York

By WILLIAM L. STIDGER

AS OLD if not older than the Pyramids of Egypt; larger in some ways; more beautiful in ornamentation; with their own symbolism; more than one hundred pyramids, wrapped in the silence of thousands of years, keep their ancient secret in the Valley of Pyramids at San Juan Teotihuacan, Mexico.

A world of romance and mystery lies to the south of us, four days by train; Pullman cars all the way; and at the end of the journey, a land whose history makes our own a new-born child in comparison.

The Tombs of the Egyptian kings, whose discovery and penetration have held the ear of the world, are not as old, nor as mysterious, as the sacred pyramids of Mexico.



Showing steep steps and symbolic figures in the Citadel at the "Valley of a Hundred Pyramids" in Mexico. These serpent heads have black eyes made out of volcanic glass, red throats and pure white teeth—the colors as bright today as they were four centuries B. C.

I have traveled the world over, but I have never seen a spot where the ages brood as they do over the Valley of a Hundred Pyramids. Napoleon told his troops that forty centuries looked down upon them from the Pyramids of Egypt; but had his lust of conquest led his armies to the Valley of Mexico City, he might have told them that eighty centuries looked down upon them there.

The only world-relic I have ever seen that compares with the pyramids of Mexico is the Temple of Boreboedoer, in Central Java, but even this great pyramidal temple dwindles in comparison with the Pyramid of the Sun and the Pyramid of the Moon in Mexico.

This Pyramid of the Sun, which has only recently been unearthed from its twenty-foot blanket of volcanic ashes and debris—great stones as large as wheelbarrows and black ash, five feet thick, which destroyed the people who built these pyramids and covered up their magnificent handiwork—is a truncated artificial mound 216 feet high by 760 feet around at its base.

I climbed this massive bulk yesterday, counting the stone steps that lead to its top. From the ground to the end of the first terrace, seventeen steps; from the top of the first terrace to the bottom of the third terrace, thirty-eight steps; from there to the fourth terrace, sixty-nine steps. These steps are divided into two sections. In the fourth section of steps there are fifty-two in the climb, twenty steps in the fifth climb and forty-eight in the sixth climb upward.

These steps are so steep that in ascending them one has to use hands and feet. In the fifth section of stone stairs, the sides of the pyramid curve outward so that one cannot see the top of the twenty steps from the bottom. They make a curve like the curve of the earth on the sea. The steps are about seven feet by eleven inches in width and about a foot in height. They run right up the side of the steep pyramid so that it takes an amateur "Steeple Jack" to climb them safely. I thought of those men who climb the sides of city skyscrapers as I watched the guides preceding me. When the stone steps end, there is still a little mound of earth to climb on the top of the pyramid, a mound about fifteen feet high. On the top of this mound there was discovered a hideous but symbolically significant statue to the sun god, which years ago was removed to the National Museum in Mexico City.

The tradition is that in the days of the Toltecs, at least four centuries before Christ, human sacrifices were offered every year from the top of the great pyramid. Down along its steep sides, great sharp and ragged stones protrude every five or six feet. They are made of flint and edged like knives. They are as large as water-buckets and literally pock-mark the sides of the monument.

The fairest, strongest, wisest boy and girl of the tribes were selected for this awful sacrifice. They were fêted in luxury for three weeks. The boy was given the finest of wines and food; the fairest daughters of the tribe for his own. All that he wished was his. He was dressed in splendid gowns. The people poured their gifts on him. He was paraded like a king and worshiped.

Then on the sacrificial day he was led, with all the others selected for the rite, along what is called "The Highway of the Dead" to the top of the pyramid and, after certain ceremonies were observed, was cast over the side of the pyramid to a heroic and honored death—and once again the sun was propitiated and would shine upon that beautiful valley.

I found the same practice in Eastern Java, where the primitive peoples carried their sacrificial victims to the top of old muttering volcanic Bromo and threw them into the mouth of the crater of this fiery monster which still belches its threatening fire and smoke from the bowels of the earth.

The Pyramid to the Sun has five great terraces running from the ground to the top, erected with perfect technical skill; a feat which compels the admiration of modern engineers. On the top there was a gigantic statue of the sun god made of a single mountain-like block of porphyry, with a breast-plate of pure gold which must have shone with resplendent glory in the sunlight, and which must have been visible over all the Valley of the Pyramids.

Stand with me on the top of this ancient Pyramid to the Sun.

Look to the east where the sun is rising and you will understand the awe that filled the souls of the Toltecs who worshipped the sun from this great height. To the east you will see hundreds of smaller pyramids and beyond them a line of beautiful mountains breaking the sky-line with their jagged peaks, one of which is the ancient crater of the volcano whose eruption covered these pyramids.

Turn from the east to the south and you will see lying below you a magnificent piece of engineering in the remains of what is called the Citadel.

This is the Temple of Quetzalcoatl. It is quadrilateral in shape. It has only recently been excavated.

It is like a huge stadium, with great walls, still intact, surrounding a vast open space, 160,000 meters square.

The four points of the great inclosure correspond to the four points of the compass.

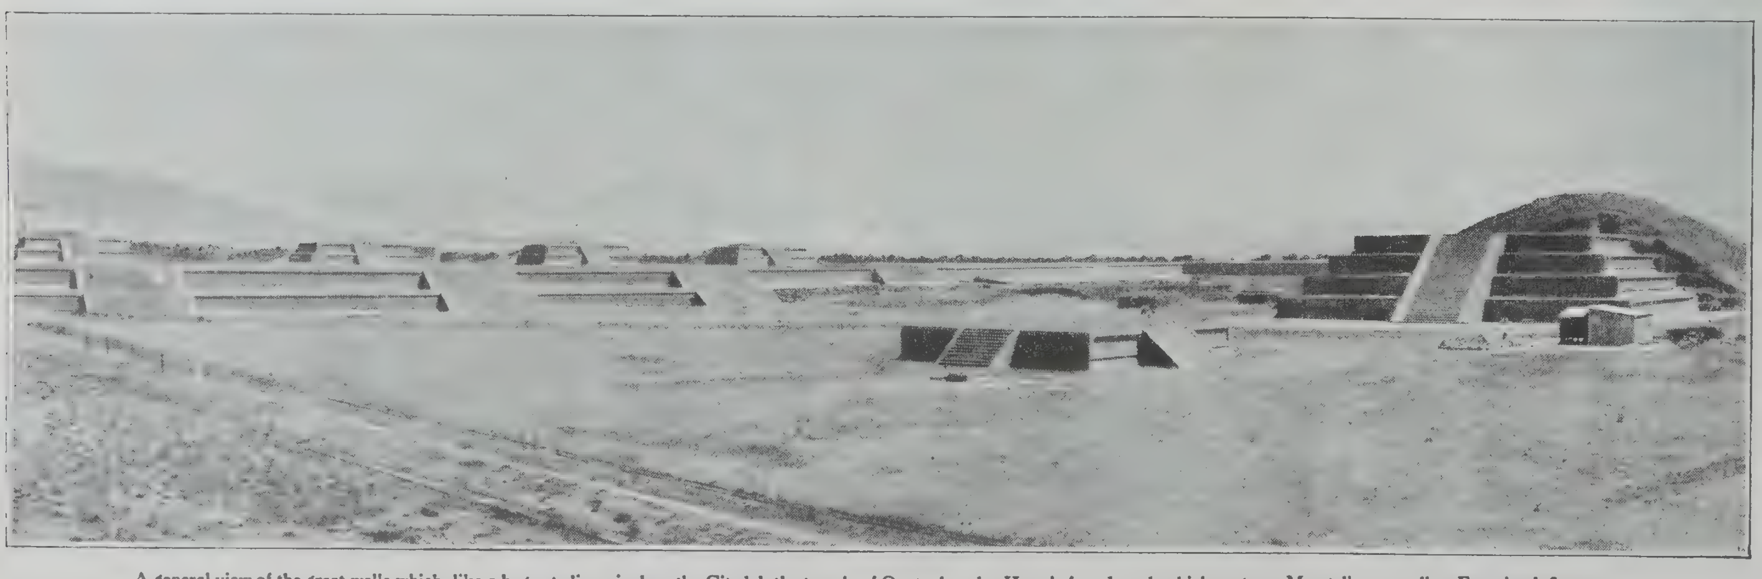
On each of the walls of three sides—south, west and north—there are four smaller pyramids, rising about twenty feet high; twelve smaller pyramids in all. Standing at the western side of this Citadel and facing east you may see at the far end of the great inclosure a much larger pyramid which has thirty-nine steep stone steps leading to its summit. It was on the top of this central Pyramid of the Citadel that the sacrifices took place coincident with the sacrifices on the top of the Pyramid of the Sun. Back of this central Pyramid of the Citadel was the Temple.

The Temple is adorned with snakes or sea serpents from thirty to fifty feet long, sculptured out of solid granite, from the mouths of which water is supposed to have spurted on sacrifice days. There is an Oriental suggestion in these serpents, one of many indications that there was Mongolian as well as Egyptian influence at work on these temples.

All this you can see from the top of the Pyramid of the Sun by looking to the south, down from that great, expanding height upon the outline of the Citadel. It almost looks as if you could jump from the top of the Pyramid of the Sun, where we are standing, to the top of the central pyramid in the quadrangle of the Citadel.

Life is to the east; Death is to the west.

This has always been true in ancient mythologies. Pioneers are always and forever traveling to the west from the east and the rising sun. They follow the path of the sun.



A general view of the great walls which, like a huge stadium, inclose the Citadel, the temple of Quetzalcoatl. Here is found work which portrays Mongolian as well as Egyptian influences.

"Going West" was the symbolic phrase for death in the World War. So, as we stand on the top of the Pyramid to the Sun and look directly west, stretching away at our feet is the Highway of the Dead.

It is built of stone and is thirty feet wide. Its way is lined with pyramids, on top of which homes were formerly built. Along this pyramid-lined way of death the sacrificial victims were paraded on sacrificial days. It must have been an impressive sight, with hundreds of thousands of people gathered in that vast valley.

Bodies of unnumbered men have been unearthed from these smaller pyramids along the Highway of Death, and these bodies and bones show marked Mongolian, Egyptian and even Negroid features, which is another indication that the civilization of Mexico in the days of this pyramid-building was made up of many racial types from distant lands.

Along the Highway of Death, down upon which we are now looking, there are many ruins which are called "Los Subterraneos," habitations down under the earth thirty to fifty feet. I visited these underground dwellings and found beautiful frescoeing and painting on the walls in colors of red, yellow, gold and black, as clear today as when they were laid on centuries before Christ.

I found a bath room with a shower bath; a bake oven, and a well a hundred feet deep which supplied the subterranean inhabitants with water.

Turning again from the west to the north—right face—and looking down from the Pyramid of the Sun, we see the Pyramid of the Moon. It, too, is an imposing structure with great stone terraces.

This pyramid is smaller than the Sun Pyramid, being only 151 feet high. Around its base it is 426 by 511 feet. On its summit is a crowning platform made of solid stone about twenty feet square.

To the north and the south there are two high mountain peaks of a beautiful conical structure and engineers say that if a line were drawn from one to the other of these peaks it would pass directly over the apexes of both pyramids.

To stand on the top of the central pyramid—the one erected to the sun—and look at the distant mountains that surround the Valley of Pyramids, and down upon the impressive remains of the Citadel, the Pyramid of the Moon, the Highway of Death, the Subterranean Habitations and the hundreds of smaller pyramids that are literally scattered like tree stumps in a depleted forest, is as impressive an experience as one will find on the face of the earth.

That these great pyramids are little known is due to the fact that they are still in the process of being excavated. Cortez knew of their presence but nothing was done to unearth them. Then followed the long line of wars and revolutions, so that it is only during the last ten years that the work has been seriously and continuously undertaken. Even today much remains to be uncovered. Workmen were busy when I was there. Narrow-gauged railways with dump carts were rattling along. Centuries were being exposed to the light before our astonished and bewildered eyes. We were looking upon a civilization and a religion that flourished when Moses was leading the children of Israel out of their captivity; when the giant Sequoias of California were young striplings; when the land now called the United States was witnessing the work of the Mound Builders who left crude series of earthen piles to mark their way—thus early the builders of the Mexican pyramids were engaged upon works of magnificent art, symbolism, engineering achievement and religious significance.

"IF THAT thing could only tell its story!"

Dr. Sylvanus Griswold Morley, of the Carnegie Institute, studied a plaque that had just been unearthed. It was a hot July Sunday morning and we were sitting on a pile of black volcanic dust that had been thrown out of the old pyramid.

The relic was a Votive Offering Plaque about half the size of a fire brick. On it was the figure of a man with hands raised in prayer. Red and deep yellow lines of colors marked the outline.

"Are these discoveries really significant?" I asked Dr. Morley.

"As significant as any in Mexico."

However, a more interesting discovery had recently been made. It is either the floor or the walls of a temple room. There are two large colored carvings outlined in deep yellow and red. One figure is that of a mother holding a babe in her lap.

"It looks like a floor," said Mr. Niven.

"They would not have walked over their gods like that," suggested Dr. Morley.

"Then it is a wall of the Temple tumbled over either by a flood, by volcanic action, or earthquake," said Mr. Niven, as we stood looking down upon it.

This piece of carved flooring or wall, whichever it is, lies seven feet under the earth on top of a pyramid temple near San Miguel Amantla, which is what the archeologists call a Mexican-Mongoloid pyramid. The piece is more than five thousand years old. It is seven feet long, four feet wide and weighs about five hundred pounds. Two strange carvings, dedicated to the sun god, ornament its polished surface. The stone is of cement and the carvings have been colored in red and yellow and are as clear today as they were a thousand years ago.

Sanagum, the Spanish priest, who is Mexico's greatest historian, came over with Cortez and immediately learned the Aztec language so thoroughly that he could both write and speak in it. It is from his marvelous books that most of the material comes which interprets the findings that were being made last summer in the new excavations in Mexico, chief digger of whom is the little Scotchman named Niven.

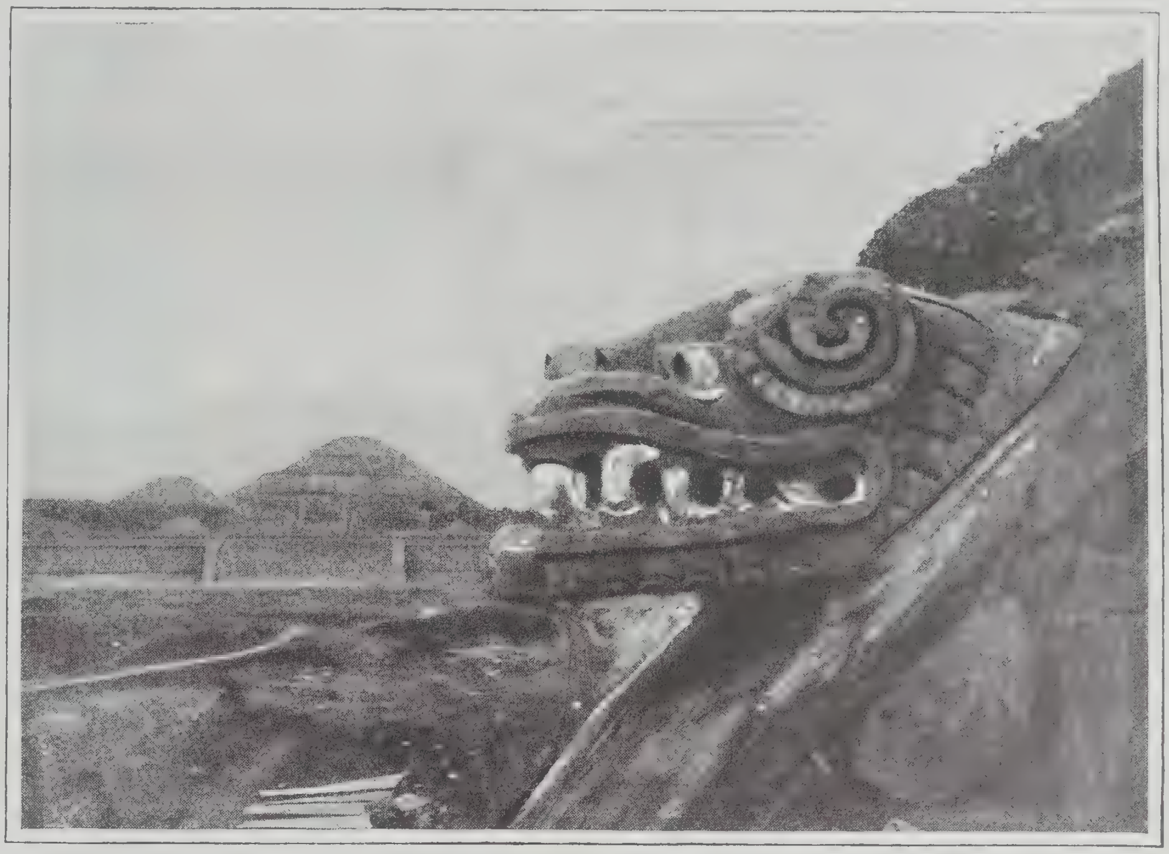
It was through his courtesy that I, having just arrived in Mexico City, was granted the privilege of accompanying the Carnegie Institute party on this mission of uncovering American history of thousands of years ago.

All of the plaques and all of the larger symbolic carvings and drawings are in red and yellow; the red representing fire, which forms the outline of these carvings and the yellow representing the fire god coming out of the fire.

The old myth of the fire god which is represented in this temple relic, comes from the Toltecs and is consequently very ancient.

To this fire god the Toltecs, who came before the Aztecs, erected the giant pyramids.

The myth of the fire god was handed on by the Toltecs to the Aztecs and even as late as 1521 A. D. this myth was alive.



One of the sea serpents in the temple at the back of the pyramids in the Citadel of "The Valley of a Hundred Pyramids." This photo also shows the Pyramid of the Sun in the foreground and the Pyramid of the Moon to the extreme left.

The legend says that there was a marriage of the water god and the earth mother and that from their union came all productivity of the vegetable world.

This earth mother in Mexican-Mongoloid mythology is always represented as a woman with a crown of serpents on her head, symbol of the fertility that comes from the water.

The moon god is the wife of the sun god also and the daughter of the fire god; thus being, as in Egyptian mythology, wife and sister to her own husband.

Both the moon god and the sun god are looked upon as "suns" of equal power; the one to rule the day and the other to rule the night; equal in rank.

It is a rather curious thing that the water god of the Mexican-Mongoloid excavations has great round eyes that look for all the world like the modern student spectacles with wide rims.

I asked Mr. Niven what these great round eyes meant and he told me that they represented springs or water-holes from which the water god was supposed to come with his fertility and his power of productivity.

"Where are these symbols of the gods found?" I asked the excavator.

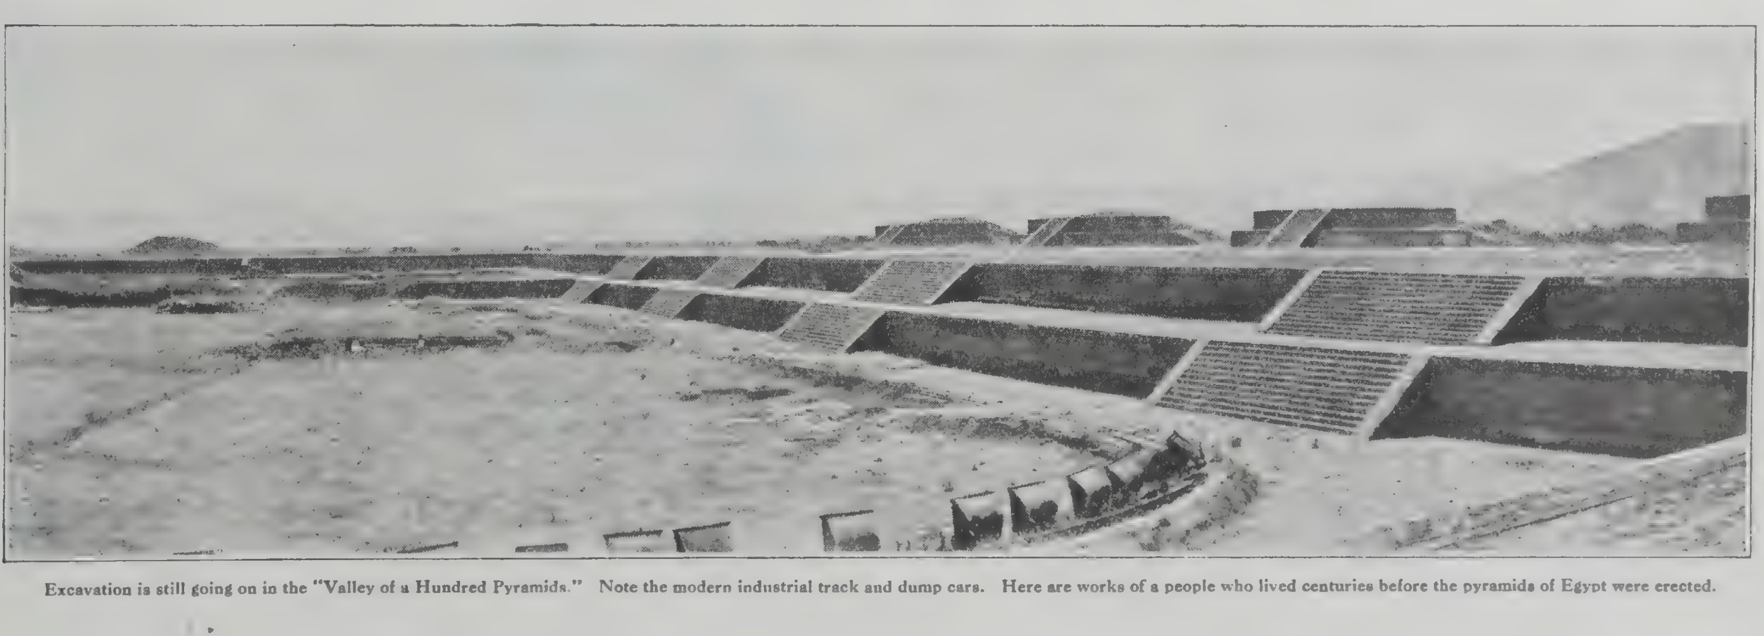
"On the temple walls, floors, and in private dwellings. They were supposed to bring good fortune and to keep away all evil from the faithful. That is why we find so many of them in the excavations."

There is a strangely beautiful squared spiral symbol found all through these ruins of the ancient cities and pyramids of Mexico. One morning I unearthed a large one myself.

This squared spiral symbol is to the Mexican-Mongoloid mind what the cross is to the Christian and in this form the inner shrines, or the holy of holies, were built down deep in the pyramids which we are uncovering now.

The mythology of these Mexican-Mongolians, which has all been corroborated by the discoveries made last summer, shows that there were five supreme gods.

The first was the dual god of the double face, the sun and moon god; the second was the fire god; the third was the corn god with fire flowers in his headdress; the fourth was the earth mother, always shown ready for the coming of the water god; the fifth, being the sun god wearing the symbol of the sun, which is two concentric circles on his forehead.



Excavation is still going on in the "Valley of a Hundred Pyramids." Note the modern industrial track and dump cars. Here are works of a people who lived centuries before the pyramids of Egypt were erected.

The "Red Bank Register"—An Object Lesson

A Purely Local American Weekly That Is Not on the Decline

By JOHN DAVIS ANDERSON

HAS the sun of the American weekly newspaper in the small towns and hamlets set? Will the enterprising journalists and publishers who, in a modest way, yet vigorously, have kept alive the homely friendships, the common interest in community life, and the traditional ideals of a great people in many sections of a vast area, bow to the onward march of your big city newspaper? Or must the successful weekly paper meet the sharp competition of the larger dailies by going to press every twenty-four hours, to keep up with the swift pace and the eager demands for news?

A vigorous negative is sounded in Red Bank, New Jersey, in historic Monmouth County, long a progressive subdivision of a flourishing garden state, where the Red Bank *Register* still keeps alive the personal paragraphs of a red-blooded people. Down where Molly Pitcher won undying fame by taking her place at the cannon of the brave colonists, this sturdy example of old-time journalism is still an intimate part of the lives of an industrious and prosperous people.

Curious to learn the secret of John H. Cook's generous measure of success in a field that has been characteristically styled a "small town" community, I visited Red Bank to study at first hand this genius of the types.

Various newspapers arrive on the fast trains, that connect the Jersey shore and New York and have their circulation in Red Bank as well as in other towns. Hustling publishers in the shore cities and other near-by places add to the wealth of reading matter, and the magazines and myriad publications of all kinds find readers there as elsewhere. Yet through all the years for nearly half a century the *Register* has flourished and today ranks as one of the most substantial publications in the state, a powerful ally to the local merchants and business men who make generous use of its columns, and a household fixture, where for two generations at least it has been welcomed every Wednesday evening. *It has the largest circulation of any purely local weekly newspaper in America.*

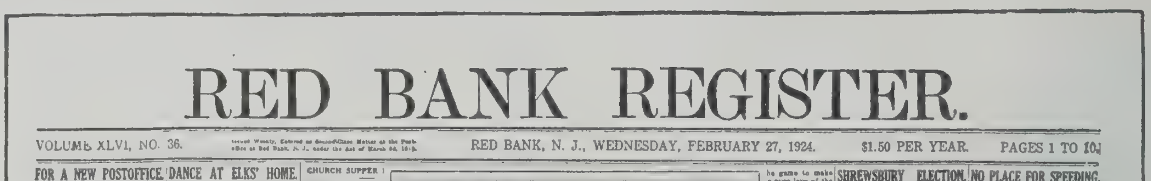
Strict adherence to the old-fashioned ideals of the country editor, who considered himself required to speak out fearlessly and without fear of consequences to himself or his enterprise, has led to the continued success of Mr. Cook. In a field where other editors have flourished for a time and where many who thought they had grasped the full significance of editorial responsibility used their money and talents in getting out publications, only to fail, he has gone steadily ahead with his paper. This spirit of independence in Monmouth County, where his expressions of opinion often ran counter to the prevailing political thought, resulted in frequent indictments of the vigorous editor.

But he came out of every situation with flying colors. Once following a trial on one of the numerous true bills against him in a section where political influences were all-powerful, the trial judge who ordered a verdict of acquittal commented that if Mr. Cook had done less than he did he would have fallen short of his editorial duties. These experiences, in the final analysis, only strengthened the editor in his civic leadership and enhanced the respect of the people he served for their sturdy champion.

Mr. Cook pointed out the slow transition of the editor who was always poverty-stricken, to the business leader. Settlement of small towns and villages about the period of the Civil War soon crowded out high aims of the humbler men of the profession, and the love of money took the place of older traditions. By 1875 the change had been practically completed, he said, and from personal representatives of the thoughts of their owners the country newspapers became institutions for making money. Old-timers continued in the ancient ways, it was true, and some holding high ideals made money, also, and continued to speak fearlessly on every topic on which they felt called upon to express an opinion. The editor was proud to list himself as the last of the disciples of personal journalism and to this day intimate comments on men and affairs afford an opportunity to keep in close touch with the daily events, many of them minor compared to affairs of general interest which are treated by the modern editor.

Partisan politics finds no place in the *Register*. Mr. Cook was active in the county affairs of the Republican party for many years. Of late he has been independent, with a leaning toward the Democratic party. But the political viewpoint of the editor, when it involves partisanship, is not diffused by printer's ink throughout his paper. Politicians, naturally, purchase space liberally during campaigns, but this is the last thought in the writer of editorial or other comment, as public opinion is being formed prior to election. As an adroit politician Mr. Cook has ruled that the virus of partisanship must be carefully excluded from the *Register's* columns, especially in local contests.

From the start the *Register* has been a "John H. Cook" newspaper and this saturation of every department with the personality, industry and character of the leading spirit has caused it to retain that flavor of individuality long a characteristic of American journalism, but later giving way to the "standardized" viewpoint of news treatment, so manifest, especially, in the larger centers of the country.



RED BANK REGISTER.

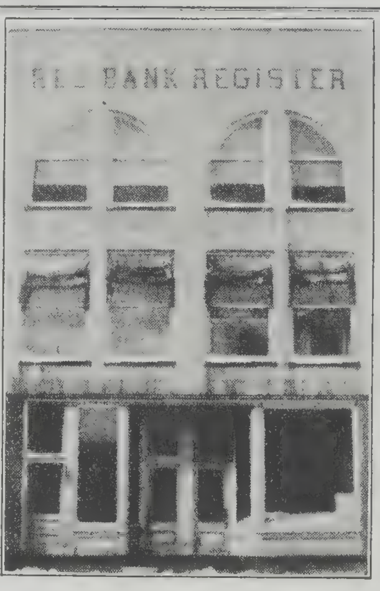
CHURCH SUPPER

SHREWSBURY ELECTION. SCHOOL BOARD LOOKS FOR SUCCESS THIS TIME.

NO PLACE FOR SPEEDING. HEAVY FINES ARE



The office of the Red Bank *Register*.

The *Register* owns its own home, a three-story brick structure, in the heart of the business district, and Mr. Cook's desk is right in the front office where everyone coming in may see and chat with him. His friendly "how d'ye do" has been a personal feature to patrons for years and while suggestions of ornate counters and modern office furniture arrangements have been leveled at "the chief," he has quietly vetoed them all. He is a personal factor, even in the small "ads," which, of course, he does not handle.

And in harmony with this spread of personality throughout the organization it may be noted that most of his principal aides started in the business as boys. With no children of his own, Mr. Cook lovingly refers to his "boys and girls," and their interests are very much in common.

Perhaps no other single feature of presenting news and views, guided by the trained thought of the staff, has been a more vital element in the sustained success of the *Register* than the policy of avoiding "boiler plate" or "canned" opinions. When Red Bank and its environs peep out to the larger world beyond its borders, from the complacency and "Main Street" contentment of historic Monmouth County, through the columns of its favorite newspaper, the vision is solely that of home talent.

Every editorial comment is written in the office. The scissors are passé, and the brilliant thinker whose flashes of deep wisdom, or cynicism, or professional humor, are spread over this broad continent, does not exploit his rare genius in the columns of Mr. Cook's paper.

Above—Residence of John H. Cook, at Red Bank, New Jersey. At right—John H. Cook, Editor and Publisher of the Red Bank *Register;* the local newspaper with the largest circulation in America.

The main proposition, in which the entire force from top to bottom is engaged, is to put out the best paper that any one in the territory covered, who is able to read, can secure. Nothing objectionable, nothing suggestive, no news copy by which the child learning to read might be disturbed gets into the columns of this model publication. And the news is purely local. Seven times a day, editions from the big metropolis of New York with its wild array of feature stuff by expert writers and "sob sisters" are sent into Red Bank, and these will satisfy any who prefer the sensational journalism of your modern big city. Newark, too, sends good daily papers for those who wish to keep in touch with shifting events and comments. The national problems are well handled by these outside literati. The *Register* linotypes save their metal for local news and naïve paragraphs, solemn, joyful and other entertaining happenings that seldom ruffle the papers of the big cities on the north, two score miles away. It is interesting to read these items in a 1924 newspaper:

"Nearly every night Bernard A. Hickey has a house full of company. He has the finest radio outfit in this neighborhood and folks like to go there and be entertained."

"Earth from the cellar of Paul Stillman's new house has been moved back of the post office building. The building will be moved the coming summer and the cellar of the building will be filled with the dirt which has been put on the property."

"Stanley and Wilhelmina Pharo of Leonardo last week received by express a 'surprise box gift' of a bantam hen and a bantam rooster from their Uncle Edward Morris, of Chaney, Oklahoma. The rooster is 'cock of the walk' at Leonardo. He has licked all the other roosters in the neighborhood."

There has been no mushroom growth. The price of the paper has always been $1.50 a year since he began it as a four-page messenger of news. The advertising rates have not been changed in three years. There is little fluctuation in the character of the circulation. Summer residents are becoming listed as transients no longer, as they find the open winters an excuse for prolonging their stay in Red Bank and its surroundings and they are listed as Jersey voters. They may spend part time in New York, where their business and professional offices are, but they are Red Bank grist for Editor Cook's lusty enterprise. They want to know what is going on, to vote intelligently, and so they read the *Register*.

The *Register* was started in 1878 by Mr. Cook, then twenty-two years old, with a cash capital of $1,125. His brother-in-law, Henry Clay, was associated with him but he retired within a few months and the editorial policy has since been solely under Mr. Cook's direction. In Monmouth County the progress of the paper and Mr. Cook's life have been blended. The publication, begun as a four-page paper, has grown to four or six times that size, as occasions warrant.

The paper has steadily prospered, and while a disastrous fire destroyed the plant early in its history, the loss was soon overcome and the advancement of the *Register* has been steady.

In the year-round quest for new readers the regular office force is ever on the alert. Subscription duties are linked closely with the reporter's other work of "covering" his territory. Newsboys, of course, meet the transients in Red Bank streets, but the reporters have a faithful check on all homes and apartments in their respective districts. If a new family arrives, a real estate man who got them located, the pastor of a church or someone else who has met the newcomers, relays the word to the reporter and for three weeks the paper is sent to the family.

It is the duty of the scribe to find some paragraph of interest that will permit use in the columns of the *Register* of the family's name, and this usually clinches their appreciation of the paper. It is then a matter of routine to sign them up for one year or less. If the plan fails, another three weeks usually provides the essential arguments, the name of the folks gets in print again and the tireless reporter usually meets with success in corraling the subscription.

Back in the *Register* office is the circulation ledger with its complete record of each potential or actual patron, and the efforts of the reporters to get subscribers are duly chronicled. There comes, finally, with a few, a permanent negative mark. "So-and-so" reads the paper purchased by a neighbor with whom, possibly, he exchanges another paper; or the person is not a reader, or there is some other excuse that ends the effort.

"Didn't have time to read," is an occasional entry that points out an indifferent prospect. Some of the other comments are equally explanatory. But the circulation of 7,300 in a territory in which the total population is 18,000 shows how intensively and expertly the faithful reporter-solicitors work.

In the continuous quest after the goal of the best possible kind of a home paper and a growing army of readers, Mr. Cook avoids premiums, clubs, contests or other circulation artificialities.

"If you have to give something with your paper," was Mr. Cook's instructions to those who suggested schemes to add new readers, "the paper must lack some vital characteristic. And there is ever present

(*Concluded on page 10*)

Mr. Ford's Page

THE people are doing their best to make this a Presidential election year without the usual national disturbance. This is highly displeasing to two classes of people, those who profit by dickering within the parties and between the parties, and those who profit by the uncertainty which in former years has struck national industry a blow. The election business has not been unprofitable to certain classes; the vast sums raised and spent go somewhere; and it is not likely that this source of profit will be easily relinquished if its beneficiaries can prevent it.

The people have done all that is possible to prevent uncertainty and dickering from seizing upon the country this year. They have done it by using the pre-election voting methods, principally the primaries, that have been made available to them. The critics may say what they please about the efficiency or value of the primaries, but for this year at least they have served to indicate in no uncertain way what the people are thinking and how they intend to vote. Indeed, for all practical purposes, the primaries that have been held have been election votes. The country is well aware what man is now the country's choice for President.

WHATEVER reluctance to act President Coolidge may have felt because of his status as successor, may now be swept aside. The primaries have indicated that Mr. Coolidge is no longer President merely through the death of Mr. Harding, but that he is President by the choice of the people. They have given him personally their mandate; the seal of the popular choice is upon him. And what they now want mostly is clean government. There is at present no issue superior to that. They believe that President Coolidge can and will give it to them, that he can if he will. With the unmistakable meaning of the primaries in mind, the President need not wait until after the next election. The primaries mean that he may and should begin now, visibly and forcibly, to be executive head of the government.

This will generally be agreed to be a fact, whether pleasing or not.

In taking the view that elections may sometimes be made detrimental to the nation's interest, we should carefully guard against the assumption that elections are essentially or necessarily detrimental, and that it would be better if these things were managed so that the people need interest themselves in them as little as possible. That would be a very dangerous assumption to make.

There was a time in this country when men voted as they were persuaded on the great issues of the day. The election was of principles, and men were elected only as they were the agents of principles. When we read the records of the Jackson campaigns and the Lincoln campaigns it is very clear that the nation was discussing its own affairs, weighing two distinct principles involved, listening to the best presentations of either side, and making up its mind with care and intelligence. Such campaigns were no small part of the educational movements which developed the American people's mind. Old-time campaigns were a liberal education in American history and policy. They were stimulating to thought; they introduced hundreds of thousands of people to the use of reason; they made a whole nation aware that there could well be two sides to every question. And the elections following upon such campaigns usually demonstrated that the people could judge the right.

All this, however, was in the days when politics centered around principles, and not, as now, around office. There could never be any objection to campaign funds gathered and expended for the purpose of educating the people on all the phases of a great national issue; everything useful costs money, and political education is no exception. No one ever objected to campaign funds that were used to give the people an intelligent grasp on the problems created by their own methods of liberty. Indeed, when you think of the millions of dollars that are being spent in this country all the time to destroy the American conception of liberty, the amount spent to insure a nation-wide discussion and understanding of vital political issues during national campaigns seems little enough. It was not wasted money that in Jackson's time taught the people how to save the country a little while longer from the power of money in political affairs. It was not wasted money that in Lincoln's time enabled the people to hear and discuss the epoch-making issues of that day.

But all that is changed. How long is it since the United States last had an issue, on which to select a President? Our issues latterly have been entirely personal or made up of prejudices. The country has grown tired of this one or that one, this party or that, and has sometimes made a change. Great issues? None. Great instructive discussions of vital public affairs? None. What has been the issue of latter years? Only this—shall we elect Tweedle Dee or Tweedle Dum?

And in the meantime the costs of campaigns have increased an hundredfold. It is a long time since any Presidential campaign has been based on arousing the serious thought of the American people on a national question. There was a time when the people thought about the Money Question, but no longer. A sensational subject like war was the last we thought about as a nation—really thought about. No one now pretends that Mr. Harding's election had anything to do with the League of Nations, one way or another. So that, with all this true, the whole cost and purpose of campaigns have been to put up one set of men or put down another set of men, as they happened to be able to win the support of the "interests" for whom a large part of the government seems to be run.

This year there is no issue, unless it may be the one injected since the first of the year, namely, clean government. But that is not an issue. There is no difference of opinion on that, so far as the people are concerned. They vote "Yes" unanimously, without campaigns or election. All they ask is for someone to give them clean government. If one may judge from the primaries and other evidences of the people's thought, they believe they now have the man who can and will give them clean government. That seems to be the only possible interpretation of the recent voting results.

But that is not all. It lays a certain compulsion on President Coolidge, a compulsion with a new element in it. While it is true that Mr. Coolidge is President and that all the responsibilities and obligations of the Presidency devolve upon him, it is also true that he was not made President by being personally chosen by the people. By virtue of his position as Vice-President he had a Constitutional mandate to succeed to the Presidency upon the death of Mr. Harding. But it is doubtful if Mr. Coolidge could have become President at the time Mr. Harding did, by direct vote of the people.

What these primary elections in the various states have done is to give Mr. Coolidge personally a direct mandate from the people. The primaries have shown that not only is he President by law, but by the public will. In state after state, by majorities overwhelming, the people have as it were chosen him again as President. The seal of the popular choice is upon him.

And that would seem to set President Coolidge free at once from any reticence he may have felt on the score of his being a Vice-President, by accident succeeding to the chief office. He is now free to feel that he has been made Prsident for himself, and for his own qualities. He is not now a successor, but a chief—the people have spoken. He must now strike out upon his own policies and respond to the call of the people for what they believe he can give them.

That is to say that, though it was understood in some of the difficult phases of the recent exposures that President Coolidge felt himself somewhat bound by his successor-status, and though this was offered as an explanation of what was regarded in some quarters as his reluctance to act, the results of the primaries sweep that away. The expression is not only one of confidence in the President, as he has been able to act since last July, but also one of hopefulness—even a mandate—that now the period of successorship may be regarded as past, and work taken up with the directness that would characterize it after a general election.

A volume of 452 pages, durably bound, containing 98 of these articles under the title of "Ford Ideals," will be sent postpaid for $1.00.

The Ethics of the Door

WHATEVER the upshot of the act excluding Japanese from America, it has set the American people thinking. One surprise was that Congress had the nerve to act drastically on any phase of the immigration problem. There has been so much pussyfooting everywhere that the appearance of conviction, even if wrong, is heartily welcomed. Sob-propagandists to the contrary notwithstanding, it was time for the United States to do something with regard to aliens in general. Times have changed from the days when we were a refuge for the oppressed of all nations, a new door of hope for the forward-looking peoples of the earth. We were right in those days; it would have been wrong to close our doors. The best came to us then; pilgrims of liberty came to us; refugees from wrong came to us. Latterly the nations regarded this land as a good place to dump their criminals, their undesirables of every class. From being a strength, immigration became a menace: how great a menace, may be gauged by the unusual conviction of Congress on the question.

But the people are thinking—If the Japs, why not others compared with whom the Japs are highly desirable? No one has heard the Japs charged with orientalizing our fashions, our fiction, our humor, our movies, our literature. The Jap ghetto, if such a thing exists, would win a medal of merit in a comparison with another ghetto. The Japs have at least created a modern nation, they know what loyalty means. We have among us people who have never made a nation, but have preyed on all, and have loyalty principally to their own ideas of things. Therefore the people think—Why only the Japs?

The fact is, we are just entering upon the problem. Nothing is settled. Nothing can be settled except upon the principles of racial affinities. Even that may not mean segregation of peoples, but control of great streams of influence now operative in the world.

Short Words

THERE are long words and short words, more of the short than of the long, and it is to the use of short words that the English tongue seems to run. Not long ago, a group of scholars chose what to them were the big words in common life, and they were all short words.

Take that outside of us, the mystery of the world, how it all falls into the span of short words: sky—star—sun—earth—air—rain—snow—tree—grass—water—grow.

And the things more near us in the way of life—that word "life" itself!—man—woman—child—food—drink—fire—home—love—work—play.

The things of the spirit, all said in short words: faith—hope—fear—grace—strong—weak—wonder.

And then those two infinitely decisive words—Yes—No.

Most of them words of one syllable, too. Even "syllable" might have been written "part."

Gen. Allen and the French

THE disposition of the French to make it difficult if not impossible for Major General Henry T. Allen, retired, formerly in command of the Army of Occupation at Coblenz, Germany, to serve as one of the American delegates to the forthcoming Olympic games in Paris discloses a side of the French character that cannot commend itself to Americans.

The French are now disposed to swagger just a bit too much for a people who were potentially defeated in 1917 with an army breaking out into open mutiny and who have been rebuked by the British premier in sharp terms, on the same score. It comes with bad grace for them to attempt to discriminate against an American officer who has won the affection of his countrymen.

General Allen seems to be guilty of two sins in the eyes of the French. He is actively engaged in collecting funds with which to feed starving German children, and he has frankly described the policy and methods of the French army officers in command of the Rhine bridgeheads which adjoined General Allen's district when he commanded American troops of Occupation in Germany.

General Allen is a fine American character and to such men the French are forever indebted.

Producers Live Longer

IT SEEMS to be established that men of action, the men who do things, live much longer than the rest of mankind.

This is much as it should be. The world prefers to retain those who can take the initiative and leave their impress upon people and institutions. These are the men the world can least dispense with. When they are scarce, community life droops.

According to a qualified investigator, for 108 picked men of action, he finds the average of life to be over seventy-three years.

The contemplative men show up less fortunately. Of 125 artists, authors, scientists and saints, the average age is just over sixty-four years.

Men of action surpass all the contemplatives in longevity, except the scientists, and here again the exceptionally useful man wins out. Philosophers and painters are just above the common actuarial rate, while the saints are below it. Authors rank with just the level of the rest of mankind.

Activity, then, is shown to be an element favorable to a green old age.

What Is the Earth Stuffed With?

IT IS refreshing to note that Europe is paying honor to an American scientist, even though the European picture of this country is distorted by overseas treatment of the current investigations.

The Royal Geographical Society of England has just awarded its Victoria medal to Director John F. Hayford, head of the College of Engineering, Northwestern University, for his notable achievement in establishing the theory of isostasy.

Isostasy has little to do with our ordinary affairs, its field being the problem whether the earth is solid or filled with more or less molten matter and gases. Nevertheless Dr. Hayford has challenged the attention of the scientific world by his discussions of isostasy. He says that he has demonstrated that the distance between Pittsburgh and Harrisburg, Pennsylvania, is nearly ten miles shorter than it was before the folding and crumpling of the rocks took place.

Isostasy, according to Dr. Hayford, also demonstrates that the earthquakes on the Japanese and Western American coasts are due to the pressure of mountains and deep seas and not to subterranean gases and lava. And it contends that while gases and fires exist they occupy pockets of the outer crust and that the earth is not a flaming mass at the center.

Appointment vs. Election

REGISTRAR FRANK A. GOODWIN, of Boston, is advocating the appointment instead of the election of district attorneys in that state.

This would be in accordance with the British practice which has given the English-speaking world the best example of the administration of criminal justice. All the judges in Massachusetts are appointees and the decisions of their courts rank higher than those of the elected judiciary of other states.

Mr. Goodwin, in describing the conditions under which elected district attorneys must work, says, "their offices are infested by politicians whose only duty as representatives of the people seems to be to keep the criminal element out of jail so it may be permitted to prey on the more decent and respectable constituents."

True as this picture is, Massachusetts is not the only state where these conditions exist.

Banking by Government

THE United States Chamber of Commerce is warning bankers that the postal savings system may become a stronger competitor of national and state banks of the country. A bill introduced by Representative Kendall, of Pennsylvania, is under consideration by the Committee on Post Offices and Post Roads, the object being to enlarge the scope of the postal savings system by increasing the rate of interest paid depositors, permitting the acceptance of joint, trust and organization accounts, doubling the maximum balance of individual deposits, and increasing the rate of interest charged depositary banks.

The warning bulletin issued by the Finance Department of the National Chamber of Commerce says the principal effect of the passage of the bill will be "to place the government in competition with privately owned national and state banks which carry savings deposits. We recognize that the postal savings system is of value as a welfare and thrift agency, but we do not believe that this justifies the government in placing itself in the savings business in competition with banks of such cities as Chicago, Cincinnati, Detroit, Milwaukee, St. Louis, Memphis, Richmond, Duluth, Omaha, Colorado Springs, Kansas City, Topeka, Portland, Spokane, Tacoma, Washington, D. C.; Springfield, Decatur and Quincy in Illinois, Gary and Hammond in Indiana, Atlantic City and Trenton in New Jersey, and Reading, Scranton, Harrisburg, New Castle, Wilkes-Barre and McKeesport in Pennsylvania, most of which are known as 'three per cent cities,' meaning that many, if not most, of their banks pay three per cent on savings deposits. In some cities, such as Kansas City, Missouri; Los Angeles and San Diego in California; Seattle, Washington; Grand Rapids, Michigan; Nashville, Tennessee; Indianapolis, Indiana, and Columbus and Toledo in Ohio, there are banks that pay three per cent and some that pay four per cent.

"The postal savings system pays no taxes and enjoys other subventions. It would offer government protection and three per cent. This would be a substantially higher return than is now offered many thousands of savers and would be attractive to many depositors of savings banks, even of banks that pay more than three per cent. Some banks would have to meet the competition by increasing the interest paid, which might mean eventually an increase in the loan rate. This would result from an unwarranted interference by the government."

Talk of "government interference" would never have been possible had the government never farmed out its Constitutional control over money. It did so, of course, because of the lack of financial brains in the government.

More Hope in Truth

AROUSING false hope among victims of diseases at present regarded as incurable is about the cruelest thing that publicists or sensationalists can do.

Dr. Joseph Colt Bloodgood, the national authority on cancer at Johns Hopkins Hospital at Baltimore, has just denounced a statement attributed to him, that a new X-ray tube has been discovered that has resulted in important progress in the treatment of cancer, as "an error and a dangerous error."

Dr. Bloodgood was subsequently quoted as discussing the general subject in terms that should be considered by every thinking person:

"At the present time cancer is a disease of ignorance. Practically everyone who ultimately dies of cancer is warned in time to receive treatment in which there is a large probability of cure, but practically no human being warned in time will act in time unless he receives from the medical profession correct information. . . .

"Warned in time, if you are taught to act in time, many diseases can be prevented and in all the chances of a cure are far greater in this early period as compared to a later period."

The remarks of this distinguished scientist and surgeon contain more of the sure essence of hope than all the spectacular claims of medical charlatans and their journalistic abetters.

In the editorial, "Fifty-fifty Solution," which appeared in the issue of April 12, the statement was made: "This meant, of course, among other things, that Negro children began to appear in hitherto exclusively white schools." This should have read: "Negroes began to encroach in the districts of the first public schools for white children." A reader calls attention to the fact that according to the constitution of the state of North Carolina, children of the white race and those of the colored race must be taught in separate public schools.

Germany's Youth Movement; the "Wandervoegel"

Present Tendencies of Chauvinistic Crusade of Childhood Is Viewed With Alarm by Germany's Intellectual Leaders and Educators

By ROBERT S. ALLEN

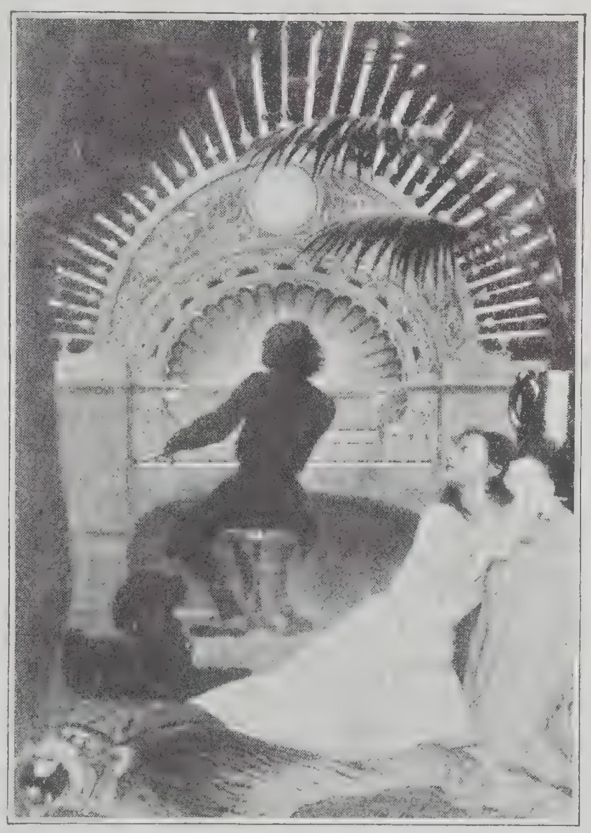
OUT of the tragic political, economic and social disasters of this nation has flamed into existence the German Youth Movement, exotic and bewildering, a creature as unreal and feverish as the rank miasma through which it has seeped.

Fine yet mad, the unconscious agony of youth to thrust away the griefs and burdens that have been bequeathed it by its elders, the evolving of a perplexing theory of reasoning by which unconsciously it has made of military defeat a betrayal of the people by leaders under the domination of un-German ideals, wound about with youthful exuberance in colors gay yet wistful and ofttimes crimson, with exotic rites at midnight in deep forests and ancient ruins, steeped in a bizarre, fantastically emotionalistic art and music and literature, and all fiercely unreasoning, unconscious, as youth alone can be, and chauvinistic. This is the German Youth Movement, its psychology, its reasoning and its activities.

Its ramifications reach from the grade schools through the universities. It is confined not only to the intellectual classes, but is as strong in membership and esprit in the peasant and working groups. It began as a sun-hued hope. It has become a grim cloud of foreboding tendencies and disasters in the future.

Universities and many cities throughout the East and Northwest will recall a tour last spring by a group of German Youth Movement leaders from several German universities, Heidelberg and Berlin. They will also remember very clearly the absolute impossibility of getting any information of the organization, its aims, its intent, its membership. Not one of the three pleasant visitors would stand up against specific questioning. There was an irritating vagueness. Much had been heard about the movement, its idealism had been much vaunted; here were three leaders, university men, and yet nothing but words: "a new freedom," "inspirational emotionalism," "not to be but to become."

Close scrutiny and examination of the movement by personal contact in Germany, attendance at meetings, rituals, participation in heated debates and fierce discussions give a very simple explanation of their apparent reticence. They were not dishonest. They were sincere and honorable youths who told all they could. They could, in fact, say nothing definite because there was nothing definite to tell about the extent of membership, intentions, programs. For them to explain that their whole reasoning was a sort of mental drawing back from blunt matter-of-fact political, economic and social trials and problems confronting their nation while physically they were chauvinistic was, of course, impossible, for movement enthusiasts. To have seen the situation in such a light would have been un-German to them.



A Fidus drawing, characteristic art of the Youth Movement. Fidus is the great art exponent of the movement and does all his work in black and white. This print is to represent "The Sun-Mass."

And this vagueness, this determined indefiniteness, is the great danger. The movement, so denunciatory of discipline and avowed leadership, has become the victim of oily, dangerous politicians and class organizations.

To speak of the Youth Movement is not to talk of a specific organization, as such is known in America. The movement is just that—a movement. It is a mass of local organizations, often irrevocably bitter among themselves, definitely opposed to each other in the different sections of the country and still more bitterly arraigned in hostility in religious camps; Protestant against Catholic, and both against the Jew.

In fact, one of the few concrete and universal principles is their anti-Semitism. "The overthrow of the Jewish financial control and manipulation of Germany" is to be found in all literature of the movement, regardless of sectional, class or other differences.

There are socialistic movement groups, Communistic Youth Movement groups; as a matter of fact, the Communists are very serious in organizing and supporting their groups, Nationalistic Youth Movement groups, Monarchistic groups and other ramifications. The groups are from every source and variety, political, economic, social and religious, all bound together by this "Teuton" atavism and German chauvinism, and nevertheless arrayed in internecine conflict of class and factional differences.

Each group interprets the strivings of the movement in its own tenets, its class or faction interests. For instance, the Communist Youth Movement talks seriously and determinedly of a proletariat dictatorship of "pure" Germans, who have not been stained by an unhallowed "French or Jew" commercialism and shattering of morals. It might be added here that it is significant that the Communists' propaganda in Germany has taken on a very decided nationalistic tone. The Nationalist Youth Movement also demands a "pure" German leadership in government and nation, but anti-Communist and strictly democratic in form.

There has been no effort made to bind the entire mass into a unity. That would be impossible. The great tragedy of Germany today is its total lack of unity, the ever-embittered clash of classes and sections; and as the nation, so the youth and this Youth Movement of theirs. In various sections of the country there have been large gatherings, but they have been as vague and bewildering as the organizations: fiery, muddle-brained outbursts of perplexing oratory, full of nothing but incoherence and words, songs, suspicious-sounding cries of reactionarism echoed by radicalism, and yet through all the confusion a very strong left-right, left-right fugue of chauvinism.

In the spring, summer and autumn, this Youth Movement takes on an outdoor aspect that goes in for a "Nacktkultur," a culture of the naked, with weeks of hiking and wandering, forest depth rites and weird exercises at midnight or break of day in old ruins and caverns. The culture of the naked expresses itself in going about in a pair of knee breeches or skirt, sleeveless, collarless and buttonless shirt, bare-legged and shoeless, with hair long and uncombed. These are not a few extreme cases but the mode of attire of thousands of boys and girls. It is a common sight to see them clothed in nothing but a pair of swimming trunks. So clothed or unclothed, they tramp about for weeks in small or large groups with little packs on their backs, a banjo, mandolin or guitar among them, in village, city or metropolis, children of the open, "Wandervoegel," as they call themselves—migrating birds.

There is also an unexpected type of discipline in the movement in regard to the use of tobacco and alcohol. An iron-bound intolerance of their use is maintained among the members of all groups, regardless of faction or of class. A youth caught smoking is ignominiously ousted. This is particularly unique in Germany where tobacco and alcohol have never been regarded as evils.

A group of "Wandervoegel," birds of migration literally, members of the Youth Movement on an itinerary, with knapsacks and string instruments. They wander about the country in this manner for weeks, living on what they can get by the wayside, playing, singing, holding their rites and ceremonials among themselves and other groups in the forests and ancient ruins.

A distinct type of art, literature and music has been developed, all with a decadent note, bizarre and fantastically emotional, with a stressing of the pre-eminence of "Teuton." The literature is wildly German.

The great artist is Fidus, the worshiper of light and sun. Black and white fantasies and grotesques; emotional figures of black against backgrounds of streaming light or flaming sun; stark gods or goddesses of brightness against black hintergrounds; lines, shadows and symbolistic, mysterious emotionalism. This art is lived in odd ceremonies and rites, staged on mountain tops at early dawn or midnight, in forests and ruins; startling dances to the strains of as odd music or still more unusual intoned verse; a mass of hokum and claptrap, childish, amusing, yet heavily sad.

Ask them how they are going to return to nature, how they plan to depopulate the cities, how they will drive out the "foreign" un-German elements, how they are going to save and regenerate the Teutonic civilization and they will brush the queries aside. It will come, out of us, is the intangible answer.

To the query, "What do you want, what do you want to be?" the reply is: "Wir wollen nicht sein, wir wollen werden"—we don't want to be, we want to become.

It is simply a movement, a result of the psychology and activity of five years of war and five years of fearsome and terrible peace. Widespread and large as this movement is, among the youth of the land who, within a decade, will be Germany as the world will know it, the matter is one to give pause and thought.

The Youth Movement today is a grievous problem to the intelligent German. The intellectual leaders are opposed to it, its constant danger-increasing tendencies. And yet, the spirit, the ideal that lighted the fire, was true and noble, the wistful desire of their youth to get away and out into the clean sun and fragrant open is dear and tender to them. In such urges, they say, lies the hope of the race.

But false ways have been opened on the highway, leading into bypaths of political chicanery and demagogy. Youth is being egged on to take the bit and charge wildly at the beck of suspicious and dangerous leaders and class organizations. The thoughtful have begun to try to keep the movement from getting too serious. They want to keep it in its original wholesomeness, its very early purity of purpose and action. An idea—and ideal—toy for their boys and girls to bite their mental teeth on. Yet it is questioned whether a hand grenade is a safe toy on which to bite any kind of teeth.

Jazz—Art for a Day—Modern Developments

A Further Discussion of Easel Art; Certain Racial Phases

By MORGAN D. E. HITE

THE conversation across a luncheon table in the Comus restaurant, between Roland Darkert and me, persisted that afternoon long after the waiter had cleared the cloth and collected for the check. Darkert had been stating his ideas—very positive ones—concerning what he called the degeneration of modern art, and tried to account for it by citing the fact that present-day artists, as a general rule, work for themselves, while artists of the past ages worked primarily in the service of others. The ancient artist did no work until he had a definite order in hand, and then was compelled to execute his commission under certain handicaps of time, place and use, as well as cost, and to satisfy the whims of patrons who sometimes did know but just as often did not know what they wanted. Darkert had compared the artist's limitations in those days to the limitations today placed on the modern architect, who works very much in the same manner and spirit as did the ancient goldsmiths, fresco painters, sculptors, armorers, rug weavers, tapestry makers, mosaic artists, painters and stained glass and pottery workers. These one and all performed their tasks with some definite utilitarian purpose in mind for the object upon which they applied their genius.

Art a Service to Humanity

MY FRIEND Darkert asserted that present-day artists worked under no such handicaps, but preferred to exercise their own temperaments and individuality in the creation of an object of art to suit themselves and then to go out and try to find a buyer or appreciator for it, or to wait patiently and in poverty for such a buyer to appear at their studio or workshop. He claimed that this change in attitude of the artist toward his art had resulted in a world-wide art degeneration, a well-nigh total forgetfulness on the part of artist and people of the true function of art. Darkert declared that ancient art was great because it had fulfilled its proper function at all times, and that this function was nothing less than complete subordination of art to the everyday practical ends and needs of a community or society as a whole; that basically art should be servant to humanity; and that to exert its spiritualizing influence on mankind, to sustain civilization, and to raise civilization still higher, it must perforce first serve, willingly, enthusiastically, humbly.

"Works of true art are nothing but pieces of human work done right! When all things that we do are done right, then all things which we do will be perfect works of art. Perfection means perfect adjustment to conditions. I maintain that the ancients knew this and that their art is the living result of this knowledge; that the moderns do not know this and that the easel artist and his art is the depressing result."

"Darkert, how do you explain," I asked, "the success of jazz music and songs, some of which seem to me to be virtually illiterate, as far as words go, and savage, almost obscene, as far as the music goes? And yet they make a wide and instant appeal to the public, not only American but European. It is true that most of this stuff is forgotten quickly, but while at the height of popularity there is unquestionably a universal appeal in them, and their composers must therefore be entitled to be called real artists by the standard you have announced of a perfect meeting of the art creation and the public desire."

Art a la F. A. D.

"YOU have opened up a new field," answered Darkert, "a field of its own, the racial influence in the arts. You are right, that the appeal of jazz is instant and widespread, uncontrollable, that such art meets with wide approval, fulfills the demand of the public. But, on the other hand, are the creators of jazz entitled to rank as artists? Apparently they are so entitled. But let us see. In the first place, as you have said, this popular art perishes almost as soon as it is born. It is what I call *art à la F. A. D.—art for a day*. Now, if there is any one factor that defines a true work of art, the genuine thing, the thing which you should always seek for in analyzing any work, it is the one factor of *permanence*. Art is a crystallizing process, and this implies utter permanency, for the perfect or full crystal has attained an utterly *final* stage of development—the nearest condition to eternalness of which the human mind knows. Art therefore is always at high noon in its genuine phases. All other forms of art are passing, incomplete, through all the graduated stages down to the lowest form of all, that which is born and lives for a moment, the *art à la F. A. D., for a day*. Into this class falls jazz and other related forms of art. The artists who produce them are artists to just that extent and no more. Call them what you will.

"Moreover, these low forms of art, mushroom-like, and growing like noisome spores of analogous specimens of plant life, and likewise to be likened unto the enormous reproduction and swift perishing, such as are found in the vermin world—this form of 'art' is distinctly a product of certain racial strains, is a phenomenon associated with the activities of the so-called 'Ashkenazim' Jews. The evolution of this branch of the Jewish peoples has been traced by Professor Dixon in his 'Racial History of Man.'* It is largely this branch of the Jews, he says, that has migrated to America, and in Professor Dixon's anthropological study it is to be noted that it is highly improbable that the ancestors of these Jews ever saw Palestine or were ever a part of the famous Bible people. Briefly, the 'Ashkenazim' Jews are a race that came from the uplands of Anatolia, Armenia and the steppes of the Caucasus and had been converted to Judaism. They are not, strictly speaking, Hebrews, their only tie with the Hebrew race being the Semitic language which they imbibed with their conversion.

"These people make up the Jewish population of America to a very large extent, so that present-day American Judaism takes its color from them rather than from the early Colonial Jews. Modern jazz music is almost exclusively in the hands of American Jews, and in a way it has come to be looked upon as a distinctive expression of the spirit of New York City. New York is inextricably associated with jazz and 'nifty' art products of every sort—the word 'nifty' itself being of Jewish origin.

"You mentioned jazz as an example of a popular art. But the Jewish people, such as we know most of them in this country, possess a remarkable ability to sense the superficial likes and dislikes of the public. I might have said the things to which human nature in general most quickly—but not most wisely—responds favorably or unfavorably. Therefore you will notice that the task of catering to *temporary* desires is an important part of Jewish commercial and artistic endeavors. We see them dominating such fields as jazz music and songs, show window decorating, interior decorating, vaudeville entertainment, motion picture acting, motion picture producing, the theater in general, costume designing, clothing styles and fashions, the design of lighting fixtures, floor lamps, dress goods, apparel and jewels, the devising of ornamental lighting effects, advertisement writing, and advertising generally, 'bargain sales'—they will be found in all things appealing to the instant, popular and superficial emotions and wants. In the staple lines and the permanent arts they are found less often and are generally a differing type.

The Spread of Jazz

"IT IS by this racial clue that I partly explain and account for jazz, and while its widespread surface-success would indicate its possessing real art vitality, it is purely a surface movement. It has had the serious effect, however, of giving a false idea to the world as regards permanent artistic works, for every work of art today, surprising as it is to say so, is measured by the standards of the world of jazz! To such an extent is this true now that there is danger of artists themselves being drawn down to the point of injecting jazz attributes into real art, of the artists and the world of art *stooping to the standard of jazz*, as already it has done in 'cubism,' and 'lewdism' and all the other 'isms,' thinking that, because jazz was successful, real art itself to be successful must partake of jazz features! The menace is a real one to present-day artists; doubly so because of the false lure of 'service' which is seemingly connected with all the superficial forms of art which I have specified.

"Today the art of ephemera has the upper hand, because in the fields of ephemeral art are the large monetary rewards at present. The arts of permanence, however, are apt to remain in the hands of the more stable line of artists, and into the arts of ephemera and jazz will gravitate the weaker sisters of the arts and those in whom 'temperament' rules. In one way, it may mean the cleansing of art to make room for the new ideal of workaday artists.

Sure-Fire Propositions

"BECAUSE ephemeral art is transitory, it is of a kind with things that appeal to the child mind. Its appeal even now is never to the strong and adult-minded ones of the people, but to minds weakened by stress or childish in their development. To a mature-minded public only a mature-minded artist can appeal. To the child-minded ones only the child minds among the artists can appeal. As America becomes more a nation of adult-minded persons, the influence of the jazz mind will be lessened."

"And now, I would remind you," said Darkert with a little twinkling of the eye, and as he reached toward his hat, "of one fact: that the Jewish hand does not go in for *easel art*. It works only on sure-fire propositions. In the world of ephemeral art his orders are given him in advance, or he truly sizes up his public and makes only that for which there will be an instant demand. Jewish art workers generally adjure easel art, abandoning it to work toward some definite goal and to produce for some known market. They therefore are not liable to the charge of perpetrating the usual easel art aberrations. It is their instinct, on the contrary, to keep out of unprofitable fields. Easel art is distinctly one of the most wasteful departments of human endeavor, a mass of misdirected human talent and energy, if the truth might only be realized!"

"I would seem to gather from what you have said, Darkert," I ventured at the last as we arose to go, "that art is almost a mechanical process after all, and that if we but knew a little more about the science of esthetics—as no doubt we will in time—that thereby art might be practiced mathematically, and with the same certainty of success, when the proper formula is observed, as is met with by the engineer in the design of motive power, structural works and electrical utilization. Do you really think of art in any such light?"

But our long seance was over. "Ah, that," he said as we passed out into Common street, "is the question which Poe almost answered."

---

* *Scribner's*, 1923.

The "Red Bank Register"—An Object Lesson

Concluded from page 6

the danger that the readers sought out will be interested in the premium, not entirely in the paper."

There are no delinquent lists of subscribers. During the war, when the Industries Board called upon patriotic newspaper publishers to eliminate waste in paper, and the Post Office Department joined in the urge, the delinquent list was abolished. Subscribers pay in advance for the paper and the plan has become a permanent adjustment in Red Bank, at least it has in the *Register* office.

A unique arrangement of the advertisements, small in size, which are usually styled "classified columns," is another healthy asset of the paper. From the minimum price of twenty-five cents to space at the rate of four cents an agate line the prospective buyer or seller uses to communicate with someone interested in his argument, the "ads" are put in the forms according to size. This makes it necessary to read them all, and enhance the value of this form of publicity. Each "ad" has an individual bold-face head. There is no division of the advertisements into small groups of a similar type of notices, and guided and inspired by "Luke Longhead," a pseudonym affected to put across some encouraging thoughts to purchasers of space, as interesting a collection of statements as such a motley list could provide is given weekly to the readers for study and action.

Once upon a time a coveted position in the center of the page was given "Luke," and he merrily quipped his arguments to spur on advertising, until a humble user of the service commented that it was taking more and better space than pay-patrons got and, admitting the truth of the argument, the management discontinued the practice. It was a discrimination against the paid advertisers, the office concluded. No position in the paper is sold, the man with the "fat pocketbook" can gain no advantage over other advertisers by paying extra for it, as one man who sought an "island" position quickly learned. And naturally advertisers pay the same as the local patron for space, regardless of the size of advertisements.

Mr. Cook believed those who made the profits for the publication of which he was the head should share in a distribution of the gains. Semi-annual bonuses have been given each employe and he considers all the twenty-two persons in his enterprise are identified in its progress by their co-operation.

At a social meeting with his employes in August, 1910, Mr. Cook announced that he would take in a number of his aides as partners.

He gave stock in the paper without cost to six young men in his employ, and the company was incorporated.

Get-together meetings are held every Friday, and each is expected to come forward with a new suggestion for advancement of the business. This keeps the heads on the alert and the paper reaps the profit. The human touch, too, is emphasized in correcting errors within the organization. No fault is found with an employe in the presence of another. When suggestions are to be offered to a man, when something has not gone right, he is spoken to quietly by a department head or the man's foreman. This has proved to work for better understanding, even at times when differences of opinion might have developed into arguments.

Workers are not penalized for time lost and are paid for holidays and during sickness. Each gets two weeks' vacation with full pay. Two of the staff were called to service during the war and both were paid full time while away and returned from overseas to their positions again.

Combined with the development of the spirit of morale in the business the mechanical equipment has kept steady pace with the modern presses and other machinery required. In fact, the *Register* plant is so up-to-date that it would be possible to shift from a weekly to a daily paper at once, if the management elected to issue every twenty-four hours. But the daily paper idea has never been popular with Mr. Cook. The idea was urged upon him but he pointed out that multiplication of the hustle required to get out the *Register* did not appeal to him, and the metropolitan and other big city papers filled the daily need at this time, at least.

Mr. Cook traces his ancestry back to the early life of the American colonies. His mother's forbears came here from Holland in 1680 and his father's people trace their origin in America to 1690, when the first group came from England. Mr. Cook was born in Jersey City, but he went to Red Bank in early boyhood and has remained there since.

He enjoys foreign travel and for many years has spent several months in each year abroad, except during the World War. He has visited practically every country on the globe, but finds his greatest delight in visiting primitive peoples and uncivilized countries.

Fond of books, Mr. Cook has an extensive library of approximately 6,000 volumes, principally works of philosophy, poetry, travel, natural history and nature books. At one time he was a collector of first editions of his favorite authors. His collection of works of Philip Freneau, styled "Poet of the Revolution," whose home was in Monmouth County, is said to be one of the best and most complete in existence.

Baseball Stars Who Came in by the Back Way

How the Famous Major League Players Are "Discovered"

By PAUL MACDONALD

PILED on the desk of the owner of a major league baseball team was the morning mail. He glanced through the letters with a bored feeling; advice and suggestions from well-meaning patrons of the sport. The team was losing and the public was taking unto itself the task of remedying the faults and switching the individual units into a winning combination, an old story.

Among the letters was one from Weiser, Idaho. The owner looked at the name a second time and then, before perusing the contents, his glance wandered to the signature—a strange name. He had never heard it before. He read the body of the letter:

"We have here the greatest pitcher in the world and you need him for your ball club. You better get him signed up right away."

The owner tossed the letter into the waste-paper basket. Just another letter of that kind. He got thousands of them every year. He proceeded with what was left of the mail.

A few weeks later the owner of another major league club received a letter from Weiser, Idaho. He, too, had never heard of Weiser, nor had he ever heard the name signed to the letter. He read:

"You need pitchers and Weiser has the greatest pitcher that ever lived. He'd set the league on fire."

The owner laughed. "He'd soon find the league made of asbestos as far as he was concerned. Just another nut." He, too, threw away the letter and forgot about Weiser, Idaho, the pitcher and the writer.

Then one morning the owner of the Washington team started the job of going through the mail. It was light that morning, only a few letters. He had nothing to do. He picked up an envelope bearing a Weiser, Idaho, date mark. He had never heard of Weiser and the name of the writer was equally strange to him. But, having nothing else to do, he read the letter a second time, chiefly for amusement. What made him smile was the information the letter contained:

"All the baseball scouts must be asleep, for they are passing up the greatest pitcher in the country. He's a big boy pitching here in Weiser. Nobody can hit him and he strikes out from twenty-two to twenty-seven men in each game. There's no ball player in the world what can get an honest hit off this pitcher."

The owner reflected a moment. Yes, the club had a scout in Idaho. On this day he probably would be somewhere near Weiser. The owner had a clerk call up the railroad offices and ask where Weiser was located. They finally found the place. The scout really was near Weiser. So the owner wired the scout and instructed him to "take a run over to Weiser and look over a pitcher the town is mad about."

The next morning, when the owner arrived at his office, a telegram was awaiting him. It was from the scout and read:

"I have signed the pitcher and am bringing him to Washington."

Several days later the scout arrived with a tall, well-built youngster, blue-eyed, flaxen-haired and shy. Closeted with the owner, the scout told his story:

"I went to Weiser and this boy was pitching that afternoon so I stayed and watched him pitch, and just as soon as the game was over I took him to the nearest place—it was a butcher shop—and had him sign a contract. You've seen the boy and here's the paper."

The scout produced a piece of soiled brown wrapping paper. It was the contract. It was signed "Walter Johnson."

"Johnson?" reflected the owner, "Johnson? I don't believe I've heard of a minor league pitcher by that name being so good."

"No, you haven't heard of him but you're goin' to hear a lot of him and so will the rest of the country," replied the scout.

Stars Who Went Begging

THE owner was correctly informed. The boy whom the scout brought to Washington made good from the start, one of the few major league pitchers that ever did, since nearly all the others need at least a season of experimenting and coaching. He is the greatest pitcher the American League ever produced and the only pitcher that ever reached the heights with a single delivery since Johnson, during the years when he established his remarkable record, used nothing but a fast ball. More than that, Johnson is one of the most beloved men that ever engaged in any sport, a remarkable character.

One of the most hazardous undertakings in the professional sport or amusement fields is that of getting players for major league teams. In the course of one year several thousand players are recommended to each of the major league teams and it is self-evident that no club can possibly secure more than about two per cent of the men recommended. To insure for his team the possible services of a ball player, an owner is compelled to spend money, the price varying, naturally. If he engaged every player recommended he would be bankrupt within one year's time.

There is not an owner in the major leagues who cannot point to a dozen or more stars and tell you how they "slipped through his fingers." Sixteen major league teams had an opportunity to get Tyrus Raymond Cobb, greatest ball player of all time. Detroit got him because the Augusta club owed Detroit $750 and Detroit accepted Cobb in lieu of currency. Sixteen major league teams could have had Tris Speaker. He went begging for a few years and Boston finally took him on because the owner became tired of hearing from one of his scouts who kept insisting that Speaker was the greatest outfield prospect in the country. Sixteen major league teams could have had Grover Cleveland Alexander for a few hundred dollars. Finally the Philadelphia Nationals asked for him in the draft and drew him, which did not highly elate the Philadelphia Nationals nor make envious the fifteen clubs that did not get Alexander. George Sisler was rated as a fine prospect when he was with the University of Michigan. Pittsburgh Nationals claimed him when he was graduated but the St. Louis Americans signed him and the result was one of the bitterest contests over contracts ever fought in the majors and resulting from the Sisler case was one of the deepest feuds in sport, a feud that had its culmination in the dissolution of the National Commission. But Sisler is the only great star of the major leagues who was recognized as a great ball player before he entered the big leagues. Practically all of the other leaders "came in through the back door," like Cobb, Johnson, Speaker and Alexander. No trumpet blasts proclaimed their approach.

The owners of major league clubs have learned through past experiences that often the most valuable tips about players are those that seem most inconsequential. We have cited in detail the case of Walter Johnson. We have heard at least four owners of major league clubs relate how they were advised about Johnson but ignored the information because it seemed valueless.

Scouting for New Timber

THERE are 400 ball players in the major leagues. Each year every one of the sixteen clubs searches for new material for future use. This search covers thousands of square miles and in recent years the search has been so systematized that every state is covered by every club. Umpires in the minor leagues and former major league players who are managing clubs in the minors, or playing, are paid by the major league owners to scout for new material. These clubs also have on their pay roll a number of scouts. When one of the "lookouts" reports favorably on a player, the major league owner sends one of his scouts to look him over. Sometimes he sends two or three scouts. He compares their reports and sits in final judgment. Then comes the matter of securing the player. If the owner finally agrees to take him, he secures, through the payment of money or by means of a trade, a claim on the prospect.

Each year hundreds of players are secured by the big leagues. The majority of them never see a major league park, for after further tryouts in the minors they are found wanting and cast adrift, the major league owner relinquishing all claim. Some of the leading players in the majors today were owned by two or three big league clubs previous to getting a major league trial, for the trial is awarded only to those players who, after having been thoroughly tested in the minors, are found with enough talent to promise making good in the big leagues.

The followers of the home team, disappointed during a slump, often ask:

"Why don't they go out and get some ball players? Why don't they buy somebody that can hit or pitch or field? Are they afraid to spend any money?"

The major league owners spend money. They spend fortunes trying to do the very thing that the customers want them to do—get good players. If they fail it is the luck of the game or rather the ill luck of it, not due to any economy on the part of the owners. We know of one club that at one time owned more than 150 players in the minor leagues and not more than three of them ever proved good enough to be given a regular position on the team, while not one of them proved an outstanding player.

It is now next to impossible to buy a "made" ball player. So much criticism was caused by the purchases of the New York Americans from the Boston club of the same league, and by the New York Nationals from the Boston and Philadelphia clubs in the National League, that what purchasing was done before has been practically abolished. Boston, once the pride of the American League, was wrecked as a baseball city by the sale of star players, and the same thing happened to Philadelphia. Baseball followers in these two cities simply boycotted the home teams and refused to go to the park. So now, when major league clubs get hold of a star ball player, they keep him. It is doubtful if any stars of today could be bought at any price. The sum might be exorbitant at the time of the deal, but in the end it would be small compared to the loss in gate receipts.

The only chance the major league clubs have of supplying their line-ups is to secure the players from the minor leagues. They do not stop in these organized ranks but the big league scouts travel to the colleges and universities and to the semi-professional playing fields, trying to find material.

To separate the wheat from the chaff in this vast area is the trial of every major league club owner. His ever-growing organization of scouts, his filing cabinet, his record books, his index system, telegraph and long-distance telephones are brought into service, but with all these scouts and other aids and advantages of today, the owner annually sees several good men pass from his reach. Someone else gets them. He has learned to keep his disappointments to himself, for if the patrons of his park discovered what prospects escaped his net he would never hear the last of it. That is his fear. Still, it cannot be avoided.

The owner knows that in the country today there are 400 men who will, in years to come, have replaced the men who are playing in the major leagues today. Among the 400 are the baseball stars of tomorrow. He and the owners of fifteen other major league teams are trying for the cream of the future 400. Now, how to pick the cream! How to select the players that will be the headliners of the national sport in a few years!

The owner has learned that he cannot let any tip go unnoticed. That has happened too many times in the past with disastrous results. There must be no more Walter Johnson incidents! But, how can he distinguish the stupid from the intelligent? He cannot. That is the trouble.

Every baseball follower regards himself as an able judge of ball players, at least more able than the manager or the owner. He tells the heads of the team where there is a good pitcher, a good catcher, an infielder or an outfielder. He gives names and data.

This type is the honest enthusiast. He means well and gives to the best of his knowledge what aid he can to help his favorite team. But there are thousands who send information with the sole purpose of exacting some reward. A man who can enable a major league team to get a star player at little cost is certain to be paid a nice bonus for his trouble. The self-appointed scouts therefore figure that if the man makes good they will be that much money ahead, and if he fails to make good they will be nothing out. They cannot lose.

Then there are many people who write simply to show their good will. They expect a certain amount of recognition as a reward.

Many of the letters recommending players are from people that have never seen the players they recommend. They read about them in the newspapers and draw their conclusions. A baseball enthusiast in Urbana, Ohio, will read the Springfield, Ohio, newspapers every day and be impressed by what is printed about Ogle, the second baseman. He imbibes all this information and finally decides that Ogle is about the best second baseman in the western hemisphere. So he writes a long letter to the Chicago National League club, providing that is his favorite team, and tells the owners all about Ogle, the second baseman of the Springfield, Ohio, team. He will give all the information that he has been assimilating for weeks and weeks and be convinced that it is all his own. The Chicago owners receiving a letter as sincere as this sounds cannot miss the opportunity of having a look at Ogle, so they send on a scout who spends several days, probably, looking at Ogle. He discovers that Ogle is not quite good enough for major league baseball but the fact that Ogle was so highly recommended cost the Chicago National League club about $100 to have him investigated.

Where Tips Sometimes Lead

ONE major league club received a number of letters last year about a player in one of the minor leagues. The letters were all from the same man and finally the club sent a scout to look over the player. He discovered that he was none other than a man who played in the majors fifteen years ago. He had drifted to the minors and by taking good care of himself, managed to play on, season after season. He had polish to his play and that impressed the onlooker. The scout remembered the player when he saw him, but on reading the enthusiastic letters he had concluded that this must be a youngster of the same name. It never occurred to him that this man, who once sank his spikes into major league infields, could possibly still be in the game. But there he was, more than forty years of age and still going well enough to impress the fans.

Many players recommended look good. Even to an experienced eye they have sufficient merit to carry them into a regular place on a major-league team. There is a type of ball player who is just a shade under the big-league standard, a type that always threatens to make good in the majors but who never quite shows enough to hold on while he continues to be a sensation in the minors. This type gives the big-league club owners the greatest amount of worry, for they feel they cannot let them go and again they feel they cannot afford to hold onto them. They always give the impression of being just about ready to blossom into stars, but they never do. The trouble is that this type is not easily recognized. It is confused with the type of player that comes slowly and suddenly reaches the top rung.

To show what tips lead to and what the end of the trail often proves to be, an owner told us about receiving several letters concerning a great ball player in Atlanta, Georgia. He decided to send a scout to Atlanta to look over the prospect. The scout arrived in Atlanta, inquired about his man and learned that a player of that name was creating a sensation. Asked where the player could be found, his informants told him that he was at the Federal penitentiary, so the scout went to the prison and inquired, expecting to find the player employed as prison guard.

"Sure, he plays on our prison team and he's a star," the scout was told.

"I'd like to see him."

"What about?"

"About joining a big league ball club."

"But he's a prisoner."

"How much longer has he got to serve?"

"That, mister, is hard to tell. You see he's in for life and he's enjoying the best of health right now."

The owner reflected a moment then observed:

"But you've got to expect things like that. You can't afford to let any tip go by. You have heard about Walter Johnson's discovery, haven't you?"

We had and so have you and you can understand better how great a gamble this proposition of building a winning baseball team really is.

The Passing of Another Epic

Last New England Whaler Returns From Final Voyage

By CLARENCE J. HALL and KENT LIGHTY

A dock scene in New Bedford.

THE last harpoon is all but thrown. The famous New Bedford whaling fleet is furling its sails. Leviathan may find peace in the oceans of the world. This year will probably see the dissolution of an industry which has played a unique part in the maritime interests of New England; an industry which gave its ships for the Great Stone Fleet to blockade Southern ports in the Civil War; and which took adventurous Yankees into every outlandish harbor of the Seven Seas; an industry which gave lovers of literature "Moby Dick"; and which lighted the lamps of the nation.

For more than a century blunt-nosed ships have trimmed their prows out of New Bedford harbor. Nowhere, from the arctic to the antarctic, from the Indian Ocean to the Pacific, has the mightiest of all of earth's living creatures found refuge from the barbed dart. To the stirring cry, "A dead whale or a stove boat," the great oil casks have filled, and never has the sweetish smell of the stuff failed to hover over New Bedford docks.

But year by year the whaler has been forced to lay aside his harpoon before derricks of the drillers of the western oil fields. The fleet, the masts of which once made a forest against the New England sky, has dwindled. The tall stacks of mills, wherein are manufactured fine cottons, today line the shore. An industrial city looks away from the sea which brought it fame and almost fabulous wealth. At first the yards of the square-riggers were replaced by the tapering masts of schooners as the whalemen made desperate attempt to avert the death of the industry by the substitution of smaller boats. Still the fleet shrank. The noble old barks could be counted on the fingers of one hand. The schooners were scarcely more numerous.

Not so long ago the bark *Wanderer* came disconsolately up the harbor, the last of the old-type whalers still active, bound in from what was probably her final voyage. The oil beneath her decks was scarcely worth the unloading. The little schooner *Margaret* is out on the high seas today. The *Charles W. Morgan*, most ancient of square-riggers, lies moldering against an ancient wharf on the Fairhaven shore. These, with two or three schooners tied up at dock, are all that remain to tell of the once mighty fleet, so low has sunk the estate of whaling. Perhaps this voyage of the little *Margaret* will be the very last whaling cruise.

Charles A. Morgan, with all sails set, one of the few remaining whaling schooners.

In a dusty, dimly lighted room over a bank building sit gray-bearded men. They play endless games of cribbage. A ship's clock ticks loudly. Whaling prints adorn the walls. Harpoons rest in a corner. This is the New Bedford whalemen's club. To belong one must have gone on a whaling voyage.

Among these men are Captain "Ben" Cleveland, who for thirty-five years pressed his ships all over the world, and spent many winters in the antarctic yelling his orders in the teeth of howling gales and gathering flora and fauna, earning himself the name of the "skipper-naturalist." Another is Captain "Jim" Tilton, the first man to spend winter whaling within the arctic circle, and the hero of countless adventures. They sit opposite each other shuffling their cards. Cribbage! Not very exciting sport for such men. To their fingers the pasteboards have not the welcome feel of the shaft of a keen barb.

Yet where else can they talk upon the only subject worth talking about—whaling? A prosaic, industrial city ignores them, cares little for their tales. Among themselves they spin endless yarns of adventure, tales which each has heard again and again. There is nothing else to do except play cribbage. Good old New Bedford whaling is dead.

In its heyday, the age of whaling was indeed a golden age, from about 1840 to 1860. Figures are dull things, yet a few are enlightening. A report compiled in 1843 by James Arnold gives the total number of vessels in the national fishery as 650, a tonnage of approximately 193,000. Of these vessels New Bedford was the home of more than half. New Bedford was then the fourth tonnage district of the United States, the other three being New York, Boston and New Orleans.

In that year, 1843, the greatest import was reached when 158,000 barrels of sperm oil, 272,000 barrels of whale oil and 3,000,000 pounds of whale bone were landed. With an investment at that time of $20,000,000 or so, in some years the annual catch sold for half the value of the entire fleet. Oftentimes single voyages were unbelievably successful. Here are a few: 1867, ship *Commodore Morris;* Captain Jacob A. Howland; voyage, North Atlantic Ocean; thirty months; 2,700 barrels sperm, value $192,000: 1886, bark *Europa;* Captain George Baker; voyage, Japan Sea; 6,300 barrels whale oil, 900 barrels sperm and 63,000 pounds of whalebone, value $248,000. In 1868, ship *Corinthian;* Captain Lewis, 570 barrels sperm oil, 4,000 barrels whale oil, and ship *George Howland;* Captain Jones; 360 barrels sperm and 4,100 barrels of whale oil. The gross profits of each of these last two voyages were estimated at $250,000, with a profit of $125,000 on a capital of $25,000.

The national debt of the youthful republic to the whalers of New Bedford is realized by few. The influence of these rough-and-ready men in exploration and the spreading of knowledge was tremendous. The first time Old Glory was seen in many a foreign land it waved in the breeze from the mast of a whaleship. These men lighted the lamp of an early day.

And the providing of the wherewithal to set these lamps agleam was hazardous and strenuous work, extended over such long voyages as three and four years. From the time the stubby whip dipped into the seas and the shivering spray deluded her off the island of Nantucket until the last inch of space below decks was filled, everything was expectancy and every man had a zest for his work.

With the sighting of a whale, from the lofty topmast, came the hail, "Thar she blow-w-w-s! Thar she blow-w-w-s!" From the deck came the answering hail, "Where away?" The location was established and the decks became agog with the commotion of the lowering of the whaleboats. As these tiny craft approached the vast hulk of Leviathan, the harpooner standing in the bow hurled his harpoon, a barbed spear fastened to a long rope. The barb pricked the side of the whale and a merry chase followed, the whale towing the boat at terrific speed. Sometimes the whale would dive and unless the line could be cut the boat would be carried down with him. Again, the great creature would attack the boat. At length the whale became tired out and was killed with many pricks of long lances, delivered with all the strength of the harpooner, until the sea ran with blood. There followed the picking up of the boat by the ship and the "cutting in," pealing off the hide with its thick layer of blubber to be boiled over the "try-works." The average whale gives about sixty barrels of oil; although some have been known to yield several times that quantity.

Whaling at its start was carried on in a much more modest way. As early as the opening of the eighteenth century the inhabitants of Nantucket watched from shore for the spout of a whale and then made pursuit in small boats. By the middle of the century the industry had been taken up in New Bedford, then a cluster of houses nestling at the edge of a forest. With Revolutionary times whaling was in flourishing condition, but the industry was short-lived, for with British harassing of ships it died throughout all New England.

During the British invasion of Dartmouth (New Bedford) on September 5, 1778, seventy vessels were destroyed. So severe a blow was this that not until nearly seventy years later did whaling spring up again. The War of 1812 was another setback, but with its close the New Bedford whalemen took fresh heart and plied their trade in all the seas, and in 1848 the whaleship *Superior* passed through Bering Straits, opening up arctic whaling.

The whale fishery furnished the lighting for the world, but high prices forced in substitutes, among the first being lard oil. It was, however, the discovery of the oil wells of Pennsylvania that was the beginning of the end. Rather queerly, one of the very first factories for refining crude petroleum was established in New Bedford in 1858.

The opening of the Civil War found no Northern industry in a more unfortunate position than whaling. The fleets were scattered over all the oceans and easily fell prey to Southern privateers. When the call came for vessels to be sunk at the mouths of Southern ports, the inactive whaling fleet of New Bedford formed the backbone of the "Great Stone Fleet." Forty-five vessels in all were sacrificed and of these the Whaling City gave twenty-four.

In 1871 there came an appalling disaster in the arctic when thirty-four vessels were lost in the ice floes. While not a life was sacrificed, the loss in money amounted to a million dollars. In 1867 came a second blow when a fleet of twenty ships was caught in similar circumstances, this time with a heavy loss of life.

Except for glorious memories and tales of bravery, nothing remains today for the *Wanderer* and the *Morgan.* Few of the old-time skippers, those dauntless men, still live. Every voyage was a voyage of hazard. The *Wanderer,* upon one of her last voyages in 1912 under Captain S. A. Mosher, lost one man when a ferocious whale stove two boats and then attacked the ship itself. A vicious bite at the side of the ship was made, despite a din raised on board by the beating of tin pans and shouting in an attempt to scare away the great creature. For the day the whale was victor, but the next morning, sighted again, a second encounter netted one hundred barrels of oil.

The *Morgan,* on her last voyage in quest of oil under Captain Cleveland, lost four men, when a whaleboat was going ashore to Desolation Island after sea elephants. To that spot 2,500 miles due south of Cape Town, where perpetual icy winds howl, Captain Cleveland had made regular trips and was familiar with the tides, yet when the huge "brine breaker" overturned the frail craft, he was forced to stand helplessly by while the men in the icy water died. That was a fairly profitable voyage for the ancient *Morgan,* since she came back with a cargo of sea elephant oil worth $30,000.

These adventures were, however, but commonplace tales compared with the narrative of the ship *Ann Alexander*, told by Leonard Bolles Ellis, the compiler of a history of New Bedford.

"On August 20, 1850, Captain Deblois having reached the whaling ground known as the 'Off-shore Ground,' discovered whales at about nine o'clock in the morning. The boats were immediately lowered, and by noon the mate's boat was fast to one.

"The whale ran a short distance, and then, turning, rushed at the boat, seized it in its jaws, and in an instant had smashed it to fragments no larger than a common chair. Captain Deblois immediately hastened to the rescue and took the mate's crew into his own boat," which then contained eighteen men.

"In the meantime, the disaster having been observed from the ship, the waist boat was dispatched to assist. When it arrived the crews were divided, the mate taking command of the waist, and the captain continuing with his own (starboard) boat.

"The attack was recommenced, the mate's boat being in the advance. No sooner had the whale perceived this demonstration than he again turned upon the mate, and before anything could be done to avoid the assault, the second boat had shared the fate of the first.

"Again Captain Deblois picked up the swimming crew and ordered his men to pull for the ship. The situation had become exceedingly critical, for the whale still maintained his hostile demonstrations toward the now greatly over-loaded boat. They had proceeded but a short distance on their return, when he was discovered with jaws wide open, in hot pursuit.

"Situated as they were, six or seven miles from the ship, with an enraged whale in pursuit, and no rescuing boat at hand, destruction seemed inevitable. But to their surprise and joy the monster passed without harming them, and they soon regained their vessel.

"Again on board, a spare boat was sent to pick up the oars of the demolished ones, and on their return the attack upon the cetacean was renewed from the ship itself. As the vessel passed him a lance was thrown into his head. This but served still more to infuriate him, and he again assumed the offensive, making for the ship.

"As he came near, the vessel was hauled on the wind, and the whale allowed to go past, after which Captain Deblois again advanced his ship to the attack. When within about fifty rods of the whale, it was discovered that he had settled some distance below the surface of the water. It being about sundown, the attack so far as the sailors were concerned was given up. Not so, however, with the whale.

Loading ships for a voyage.

"Captain Deblois had been standing on the knightheads, iron in hand, ready to strike when the ship got near enough, the vessel moving through the water at the rate of five miles an hour. Before time enough had elapsed for him to change his position, he discovered the monster rushing toward the ship at a speed of fifteen knots, and in an instant he struck her a terrible blow about two feet from the keel, and just abreast of the foremast, shaking her with as much violence as though she had struck a rock, and breaking a large hole in her bottom, through which the water poured in, a rushing stream.

"As soon as the extent of the damage was discovered by Captain Deblois, he ordered the anchors cut away and the cables thrown overboard that the ship might be lightened as much as possible. One anchor and cable were cleared, but the other chain, being made fast around the foremast, was not cast off. The captain hastily secured his chronometer, sextant and charts, though the water had invaded the cabin to a depth of three feet. The boats were cleared away, and such articles of necessity as it was possible to get were put into them.

"The captain made another but ineffectual attempt to get into the cabin, and then ordered the boats to shove off. He was the last man to leave the ship, which was already on her beam ends, with her topgallant yards under water, and he was obliged to throw himself into the water and swim to the nearest boat.

"When clear of the vessel and beyond the influence that her sudden sinking would have on the surrounding water, an examination was made of the stores, which were found to consist of but three gallons of water, for not a mouthful of provisions of any kind had been saved. The boats each contained eleven men, and such was the condition that it required unremitting bailing to keep them afloat.

"The next morning at daylight, the vessel being still above water, the captain, who alone dared venture on board, succeeded in cutting away her masts with a hatchet. This being done she righted. The crew then went on board, and with the aid of their whaling spades cut away the cable which still hung around the foremasts; and when that went overboard the ship sat nearly upright.

"Holes were now cut in the decks, with the hope of saving some provisions, but all that could be got out was five gallons of vinegar and about twenty pounds of bread. It must have been with indescribably heavy hearts that these mariners set off from so lately a gallant ship, that for months had been their home, and to which they must have become attached, as every true sailor does become attached to his vessel. On the wide waste of waters, boats which at their best were but frail shells, but which now were in poor condition and leaking, with scanty provisions, their situation was indeed appalling.

"The terrible alternative was forced upon them that unless a speedy rescue could be effected, the time was near at hand when the lives of one or more of their number must be sacrificed, that the others might survive. With what horror must they have recalled the terrible tale of the loss of the *Essex*, and remember how, when the fearful lottery of death was drawn, a miserable wreck of a man, a mere animate mass of skin and bones, yielded up his life to prolong that of his companions. Happily, this was not to be their fate.

"Steering northerly, hoping to reach a rainy latitude and thereby to prolong with water that life which they had no food to sustain, on the twenty-second of August they sighted a sail, signaled it, and to their indescribable joy, were seen. Soon they trod the deck of the ship *Nantucket*, Captain Richard C. Gibbs.

"Five months after this, this pugnacious whale was taken by the *Rebecca Simms*, of New Bedford. Two of the *Ann Alexander's* harpoons were found in him, and his head had sustained serious injury, pieces of the ship's timbers being imbedded in it. Disease had robbed the whale of his propensity to resist attack, or of any further 'carrying of the war into Africa.' He yielded to his captors from seventy to eighty barrels of oil."

A Christian Church in the Ghetto of New York

Concluded from page 3

tried on a charge of laxity in the enforcement of law, said in his defense:

> "I have Chinatown and the Italian section in my district, and also *the largest Jewish center in the world. There are about 450,000 people in that Ghetto alone."*

The inspector mentioned what he termed the "tough spots" in his district, declaring that a large section of it was lawless. *He told at some length of the sacramental wine which is issued by rabbis on the lower East Side. "All rabbis have permits and there is no check on the amount they issue to members of their congregations," he said. Much of it goes to other sources than that intended by law, he intimated.*

The present Vicar of St. Augustine's is the Rev. Dr. L. D. Rhodes, successor to Dr. Anthony, whose curate he had been. It was while Dr. Rhodes was showing me over the church buildings, and the portion of the old Quaker burying ground, now transformed into a playground for the children, that he gave me many of the particulars concerning the history of St. Augustine's.

"We are living under greatly changed conditions," said Dr. Rhodes, "from the days when we possessed the most numerous congregation in the city. We were affected by the destruction of the excursion steamer *General Slocum*, in which so many persons, young and old, were lost. Most of the bereaved families lived in this section, and when they moved away, the congregations dwindled in nearly all the churches in the vicinity. The population has altered entirely. A new type of people has come. I remember, while still a curate here, seeing Leon Trotsky haranguing the street crowds on the corner across the way. The haberdasher's store which stands on the corner is the site of the old Cosmopolitan Café, where he made his headquarters. I still have a clear recollection of his appearance"

"How long has the burlesque theater been running beside the church?" I asked.

"That was here when I came. The lobby is on the ground floor, but the performances are held on the top floor of the building. It was conducted, and still is, as far as I know, by the Minsky Brothers. We suffer no direct annoyance from those people, but they perpetrated something that I considered rather raw last Thanksgiving. *They put up a sign advertising a special Thanksgiving night performance, and added the words: 'Come and spend the night with our girls.'* The police raid the place from time to time on account of the character of the performances. The Minsky Brothers last year opened a theater of a similar kind on Broadway at Columbus Circle. I was glad when I heard that they had to close that place, at least. So far as the neighboring theater is concerned, there seems to be no way to close it. We are so few, and they are so many."

The burlesque theater adjoining the Chapel of St. Augustine is run under the title of the National Winter Garden. The management is given as that of "Nick" Elliott. After my talk with Dr. Rhodes, I attended one of the matinée performances. There are two elevators that take the patrons up to the sixth floor, where there is a very extensive, though dingy, auditorium. The place seems dangerously situated on the top floor of a beehive of a building in the Ghetto, but I was told that the management obtains its license on the pretext of running a roof garden.

It is needless to go into detail as to the character of the "show." Suffice it to say that all the spoken lines are suggestive of obscenity and perversion, and the actions of the performers are in keeping with the lines. The performance is given in English.

The dancer's act which was given at the performance now being described was clearly in violation of the Penal Law. I doubt if its like has ever been perpetrated on any other stage in New York City. But its suggestiveness had been the card that had drawn a large audience to the "show." I was informed that the act is introduced always at some different time at each performance, so that the police would be at a loss to know at what exact hour to raid the place.

On the first page of the theater program was this boxed advertisement:

> After the show, meet the girls at
> Jimmy Diamond's Spaghetti House,
> 133 Mott Street, near Grand Street
> Where all Professional Talent meet.

On the last page of the program was the following notice:

> Club Committees are requested to CONSULT THE MANAGER for theater parties, dinners, smokers and so forth. Special rates to clubs.
>
> Nick Elliott, Manager.

At the close of the performance, the greater part of the audience climbed down the long fire escapes to the foot of the narrow passage that divides the theater from the chapel. Out in the dusk of the crowded street, Yiddish youths, with furtive glances, were darting to and fro, in whispers offering for sale, at twenty-five cents a copy, a small vicious booklet with blue covers, an article that was being peddled also in violation of the Penal Law.

Immediately after leaving the place I made inquiries to learn how it was possible for such a theater to exist, not because it was presenting an obscene performance in which men were exploiting unfortunate women of their own race, for that has become an everyday matter in New York; but to learn why such indecencies could be perpetrated alongside a religious edifice, without their being prevented by the police, the magistrates, the criminal courts, the judges or the commissioner of licenses. The true explanation was not long in coming.

In July, 1919, the responsible managers of the National Winter Garden and their women performers were arrested and taken to the Essex Market Police Court, charged with unlawfully presenting an indecent entertainment. They were held by the Magistrate, for trial in the Court of Special Sessions. When the case came up in that court, a plea was made by their lawyers that it be transferred to the Court of General Sessions, so their clients could obtain a jury trial. The plea was a specious one, for no jury trial was ever held in this case.

The theater women were discharged, and indictments were found against Abraham Minsky, William Minsky, "Nick" Elliott, Harry Bentley and "Jack" Shargel for violation of Section 1140 of the Penal Law.

The case came up for pleading on January 14, 1920, in the Court of General Sessions, before Judge Nott. A postponement was obtained. Two weeks later, on January 29, all the indictments against the five men were superseded by a new indictment. The case came up for pleading on February 2, and again on February 3, before Judge Wadhams, in Part I of the Court of General Sessions.

Postponements were obtained by the men during the remainder of the year 1920 and during the year 1921. The case dragged on into the ensuing year.

On June 28, 1922, the indictments against the Minsky Brothers and "Nick" Elliott were dismissed, in Part 6 of the Court of General Sessions. "Jack" Shargel and Harry Bentley pleaded guilty to violation of Section 1140 of the Penal Law. These two men, male performers, were fined $25 each by Judge Mancuso.

This simple case had lasted for three years. From July, 1919, until June, 1922, it had been juggled from one court to another, from one part of general sessions to another, from one judge to another, and in its last analysis it ended in the dismissal of the principals and the imposition of an insignificant fine upon two actors. And in the year 1924, at the same National Winter Garden, under the management of the same "Nick" Elliott, I witnessed a presentation of the most degraded "show" ever performed on a New York stage. I was reminded of the testimony given by Police Inspector Coleman in relating his attempts to drive "Dollar John" Langer from his district: "He went to the Supreme Court to restrain me from interfering with him. It took me two years to drive him out." Does anyone wonder that the Ghetto laughs at the law?

No wonder that the Rev. Dr. Rhodes, Vicar of St. Augustine's, is compelled to say: "So far as the neighboring theater is concerned, there seems to be no way to close it. We are too few, and they are so many." Trinity Corporation, the most powerful religious organization in New York, the congregations of whose churches include members of the leading families, and financiers of international renown, lies helpless before this cruel affront placed upon its chapel and mission house, organized a half-century ago by valiant priests who worked and fought for the advancement of their faith and their civilization.

A Page From the History of Juvenile Literature

DR. C. A. STEPHENS

Dr. C. A. Stephens, Story-Teller and Biologist, Portrays Ideals of New England Home Life

By ANDREW J. DAVISON

THUS far no author has undertaken the writing of a complete history of American literature. There is lacking from the pages of the best and fullest works thus far prepared on this general subject anything like a full recounting of the lives and works of that group of authors who have devoted their talents to writing for the young.

There is, perhaps, no more difficult type of story-telling than that aimed to interest young persons—not nursery-book stuff, but the variety of fiction which will hold the attention of boys and girls between the ages of fifteen and twenty years, or even entertain some of us older folks who now and then return—perhaps in an endeavor to be youthful once more—to the books we once loved. The first stories we ever read have a most lingering way with them.

When someone does undertake this task, there must of necessity be a great deal said in its pages about Elijah Kellogg, John T. Trowbridge, Louisa M. Alcott, Oliver Optic, Edward Eggleston. And surely there will be a long chapter about C. A. Stephens, who was a contemporary of all these persons, knew most of them intimately, and is the only one of the group alive today. But Dr. Stephens has made a niche for himself simply because all authors of boys' and girls' stories have not written in the same vein. He has kept well away from the blood-and-thunder type of yarn, and also avoided the goody-goody narrative.

Dr. Stephens is of New England origin. He is a native of Maine and has spent most of his life, when not traveling to gather material, in the vicinity of Norway Lake in Oxford County. He was born not far from its shores seventy-eight years ago. This little man—he is only five feet tall and does not weigh more than one hundred pounds—is still active and told me that he has been "yarning" ever since he was eighteen. His pen has been moving constantly and vigorously ever since 1870 and in that time he has produced nearly if not quite twenty-five hundred short stories and no less than sixty serials.

Like nearly all persons of literary bent, Dr. Stephens discovered himself as a youth under the strong influence of a master at story-telling. The influence of Kellogg was potent in young Stephens' case in those earlier days, his pre-college years. When he finally went to Bowdoin as a student, a still more complete sway, destined to change his whole life work, took possession of the boy. Elijah Kellogg was then, and for some years later, at the height of his power. His "Elm Island" and his "Lion Ben" stories were in every boy's hands. Even today all proper attics contain some of these books. Forty years ago it seemed certain that his name would remain forever a household word and one to quicken every boy's pulse, but alas! time has erased much of his fame and it is doubtful if he is widely read these days.

This fact is a pity, for he was clean and wholesome, and not given to the melodramatic or to writing thrillers. He deserved a better fate. His stories have for their background the Maine Coast folk—a hardy people, capable of great endurance whose lives as lumbermen, fishermen and sailors made them shrewd, capable and venturesome. There are persons today in this region who remind one strongly of the Kellogg type.

He wrote of a life without motor boats, automobiles or wireless, but managed with crude settings to include plenty of humor, kick and sparkle in all that he produced.

To Bowdoin students of the Sixties and Seventies this man was something more than a writer. He was indeed a friend of most of those lads. By profession a clergyman, his work was carried on at Harpswell, only a few miles from Brunswick. There was no more pleasant journey for a student than a few days down at the Kellogg home. He had more stories in his head than he ever put on paper and was a constant delight to those who were fortunate enough to know him and to be in his favor. He used to preach to the students, but it was not as a minister that they liked him best. Whenever a boy got out of hand at college he was given his choice of being sent home or going down to Harpswell until he could "tame down." Those wild young blades who began to believe themselves regular devils always took the Kellogg cure and returned with a new viewpoint.

Not a few of the orations given at Bowdoin commencements in those days bear strong traces of this writer's style and influence. Indeed, Dr. Stephens says that he really wrote many of these and charged the students roundly for his efforts. He once consulted Kellogg about the preparation of an oration. *It was to be a mighty effort!* The subject was to be no less than the great Hannibal. The preacher fell in with the idea completely but when he named his price—$200—"I had to retreat," declared Dr. Stephens. "I did not have so much money."

While still at college Stephens took up writing, liked it, found that he could make some money at it and kept on. "Those were my literary beginnings."

His earlier writing found its place in *Our Young Folks,* just then the most popular publication in America for boy and girl readers. It had been started in 1865 through the efforts of James T. Fields. Famous contributors wrote for the early numbers—Harriet Beecher Stowe, Rose Terry (Cooke), Louisa M. Alcott, John G. Whittier, Elizabeth Stuart Phelps, and many others. Dickens' "A Holiday Romance" first appeared in its pages as a four-part serial. Trowbridge was the guiding editorial spirit and had later as his writers many of the country's best: Edward Everett Hale, Bayard Taylor, James Parton, Elizabeth Akers-Allen, Celia Thaxter, names which were known far and wide then but of whom we now hear but occasional mention from the lips of persons no longer young. What Stephens wrote for *Our Young Folks* met with instant favor.

The Laboratory. Dr. C. A. Stephens' home at Norway Lake, Maine.

Then he wrote his famous "Camping Out" series and made six thousand dollars in the first year and a half! This was indeed a remarkable achievement and placed the young man—not yet twenty-five—among the first rank of juvenile writers as based upon the number of volumes sold and the high standard of work which he had put into these books.

In 1871 this Maine young man met Daniel S. Ford, who was already making a great success with his newly acquired *Youth's Companion.* This had been started in 1827 by Nathaniel Willis, the father of Nathaniel P. Willis, and was, as described by Trowbridge, "a rather namby-pamby child's paper, until by a curious combination of circumstances Mr. Ford woke up one morning to find himself its sole proprietor."

Some of Stephens' writings were accepted, but this was not all. Mr. Ford took a fancy to him and sent him to Canada, to the West Indies, to Alaska, Mexico and to Europe in quest of fresh material. Under Mr. Ford's guidance this paper prospered beyond all expectations and its profits soon made a millionaire of its proprietor. He had set certain high ideals in its publication and one of his aims was for practical social and health uplifting. Mr. Ford was ever trying to assist and benefit mankind in practical, common-sense ways. He urged this young contributor to become a physician, that he might widen his usefulness as an author and treat intelligently a wider range of subjects. One result has been a weekly health article which Dr. Stephens has written over a span of almost fifty years.

When not absent from the country Dr. Stephens had opportunity to mingle with the literary Boston of those days; the days when Longfellow and Emerson, Lowell and Holmes were the chief figures and when the *Atlantic Monthly* was quite the sole literary diet of the whole country.

There is one subject upon which the doctor is touchy. It comes to the surface when he meets persons who take it for granted that the writing of juvenile stories has been his chief business in life. He says he would be sailing under false colors if he permitted the belief to go abroad that he had no other pursuit. His greatest hobby has been the study of biology and writing on that subject. He says that he went through the subject of Immortality while coming to his present views.

"My work has had little or nothing to do with spiritism. My effort has been directed toward bringing all knowledge and research to bear on the problem of extending life in the human organism, in health, with a full head of vitality as long as we desire to live, instead of being cut off by untimely decrepitude and death. What I am seeking is liberty to live as long as we want to live. I care very little for all that dreary, futile discussion about *disembodied souls*—probably a myth. What a sorry figure dear old Sir Oliver Lodge cuts in our general present idea of things! The great mass of people, as I view it, appears to care only for jazz, salacious fiction and the movies."

While in his writing for young people Dr. Stephens has frequently taken his readers far away and into little frequented places, the stories in which he is at his best are stories of Maine, with their scenes fixed on and about the old farm of boyhood memory, yarns in which he tells of the adventures of his grandparents and of his cousins, Theodora, Addison, Ellen Halstead, and of their neighbors, the Edwards and Murch families. Fully half of his tales have had no other background, but there remain in all of them the same wit, freshness and novelty which his work contained in earlier years. He has painted many pictures without moving his easel but without detracting from the value of the thing portrayed. No better ideas of home life—at least New England home life—can be obtained than from reading a dozen or so of Dr. Stephens' short stories dealing with the scenes he knew as a youngster in Oxford County.

Some years ago, before the Rockefeller Foundation took in hand so extensively the matter of biological research, Dr. Stephens conceived the idea of a laboratory on the shore of Norway Lake. This was built—a large building which he now occupies as his home and which houses his library. It is here that he has done most of his later writing.

Dr. Charles Asbury Stephens may be classed as a great biologist and known to hundreds. But it will be as a pleasing, homey, humorous story-teller that C. A. Stephens, ever with a real narrative to spin, will be known to thousands. His larger audience will not have it otherwise.

"What Do We Plant?"

What do we plant when we plant the tree?
We plant the ship, which will cross the sea.
We plant the mast to carry the sails;
We plant the planks to withstand the gales—
The keel, the keelson, the beam, the knee;
We plant the ship when we plant the tree.

What do we plant when we plant the tree?
We plant the houses for you and me.
We plant the rafters, the shingles, the floors,
We plant the studding, the lath, the doors,
The beams and siding, all parts that be;
We plant the house when we plant the tree.

What do we plant when we plant the tree?
A thousand things that we daily see;
We plant the spire that out-towers the crag,
We plant the staff for our country's flag,
We plant the shade, from the hot sun free;
We plant all these when we plant the tree.

—*Henry Abbey* (1842-1911)

By DR. ARVID REUTERDAHL
President, Ramsey Institute of Technology, St. Paul, Minnesota.

Science and Conservation

WASTE is the child of abundance. Our country is the land of abundance. It is also the country of reckless wastefulness. Theodore Roosevelt, our great conservationist, took the first steps to curb the wanton waste of national resources, in the year 1907. Since that time the program of conservation has had a more or less sporadic existence. In some states scientific and engineering societies have exercised their influence in keeping the conservation movement alive.

One phase of conservation has been almost entirely overlooked in the United States. While we are attempting, in a perfunctory manner, to conserve the natural resources, we have, to a large extent, neglected the conservation of the residues resulting from our manufacturing processes. American scientists and engineers are beginning to realize that the conservation problem merely begins with the protection of our national resources against private greed and exploitation; and that any conservation program is inadequate and woefully incomplete which neglects the most exhaustive use of the lower grades of raw material and the development of the by-products of these types of natural resources.

The most notable work done by any large body of technical men in the United States, in this most important branch of the conservation movement, is due to the splendid efforts of the Minnesota Federation of Architectural and Engineering Societies. This unique organization, having a membership of about 1,200 engineers and architects, has made its influence felt in indicating and guiding the public welfare policies of the state of Minnesota. The results already attained by this organization constitute an object lesson worthy of emulation by any state desirous of substituting technical knowledge for political expediency in the control of its development problems.

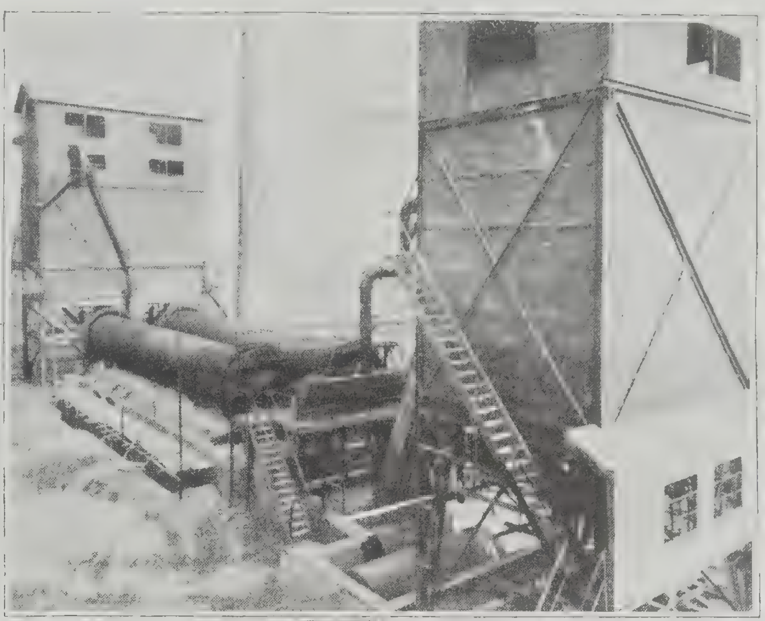
The third annual convention of the Minnesota Federation of Architectural and Engineering Societies, which was held at Duluth (February 1 and 2, 1924), may be justly designated as a "Conservation Convention." The program of this convention included the discussion of "Drainage Development," "The Work of the United States Forest Products Laboratory," "Reforestation in Minnesota and the Enlargement of Superior National Park," "Great Lakes-St. Lawrence Tide-Water Project," "Efficient and Economical Street Illumination," "Development of Peat for Fuel Purposes," "Development of Low-Grade Iron Ores," "Forest Fire Prevention," "Preservation of the Scenic Beauty of Washington, the National Capital," and "Lignite Fuel."

These discussions served to emphasize the many deficiencies in our national program of conservation. One paper in particular forcibly illustrated our wastefulness in comparison with Germany. I refer to the address of Dr. Hans Holzwarth, entitled, "Commercial Development of Lignite Fuels." Dr. Holzwarth is an eminent German scientist and engineer. He is the inventor of the gas turbine and is an authority on lignite. The Thyssen Low-Temperature Distillation Rotary Kiln is, in a great measure, due to the inventive genius of Dr. Holzwarth. He has had charge of the kiln production and development work for the Thyssen Company since 1916. Dr. Holzwarth, in his lecture, made the following statement: "In Germany the pressure to develop a process and the apparatus for low-temperature distillation of raw fuel was extremely heavy during the war. We had no lubricating oil, fuel oil, benzine; and it was for us a question of life or death to perfect suitable processes and apparatus, on a large commercial scale, to obtain the urgently demanded oil and thereby incidentally we solved the problem of carbonizing, at low temperature, any kind of raw fuel."

In Germany the urgent demand for lubricating oil was the necessity which proved to be the father of a new industry whose essential feature is conservation of all the valuable residues. Dr. Roser, of Thyssen and Company, Mülheim-Ruhr, perfected a process whereby soft coal could be gasified and sufficient lubricating oil produced to meet the lubricating requirements of thousands of tool machines operated in the Thyssen machine works. In the year 1915 Dr. Heckel discovered the special qualities of low temperature tar. This important discovery was followed by exhaustive research work conducted by Professor Fischer at the Kohlenforschungsinstitut at Mülheim-Ruhr. The Fischer drum was used in testing thousands of tons of soft coal, brown coal, lignite and oil shale in the so-called Rotary Kiln. Thyssen and Company carried these experiments beyond the experimental to the commercial scale. Many plants were erected and this concern spent millions of dollars in perfecting the final commercial process now in use in hundreds of installations. The final commercial process and its necessary mechanical equipment are, in a large measure, due to the efforts of Dr. Holzwarth.

It is evident that, in any commercial process, every required heat unit must be purchased at some particular market price. Whenever high temperatures are required in a process, the cost of generation is proportionately large. It follows that low temperature processes are more economical, all other conditions being equal, than high temperature production methods. The Thyssen Rotary Kiln recovers pitch, tar, light and heavy oils, buthan and ethan, ethylene, benzine, artificial rubber, lamp black, and so forth, at low temperatures.

In this kiln the coal is introduced at one end (at the left side in the diagrams) and is transported through the cylinder by means of a spiral attached in the interior. While the coal is transported from one end of the rotary kiln to the other, it is turned over continuously, bringing all portions into contact with the cylindrical heating surface. From the edges of the interior spiral, tar vapors, benzine, and all the hydro-carbons are liberated and mixed with steam. The steam forms a protecting vaporous cloud around these gases. From the carbon residue and pitch binder, briquettes, yielding 12,000 to 14,000 British Thermal Heat Units, may be manufactured.



Two 100-ton Thyssen kilns photographed during erection at the mine, Graf Bismarck, Gelsenkirchen, Germany. These kilns have been in operation since 1921. A similar installation will be erected for the Lignite Coal and By-Products Corporation, of Minneapolis, Minnesota, on their coal lands at Richardton, North Dakota.

A 100-ton unit Thyssen kiln, gas tar, and coke plant, recently installed for the gas works at Hamburg, Germany.

The thousands of Arabic coins which have been found on Swedish soil and which date back to the earliest days of civilization indicate that there was considerable trade between the South, which wanted amber, and the North which wanted bronze.

While conducting experiments to determine construction of nitrogen molecules, two professors at Morgan Laboratory, University of Pennsylvania, heard radio concerts by inserting special transformer and head phone in plate circuit of a two-element nitrogen-filled tube, made incandescent by passage of electrical current.

The quickest train time ever made from coast to coast is said to have been made by the special train carrying Mrs. A. H. Smith to the funeral of her husband, the late president of the New York Central Lines. Three railroads participated and the trip of 3,198 miles was made in sixty-nine hours, seven minutes.

Foreign authorities credit Japan with practically 100 per cent literacy.

There are on an average of three million persons sick all the time in the United States, and forty-two per cent of this illness could be prevented, according to the health commissioner of Chicago.

An agricultural technologist of the Bureau of Plant Industry has found that a certain parasite, called "mermithid," is one of the deadliest enemies of the grasshopper. Artificially infested grasshoppers containing six or eight mermithids die in about eight days. The parasites multiply with amazing rapidity.

"Yale will never be a rich man's college for we'll shut up before that happens. We like to have the high school boys from the Middle West. We have not always been getting them, but we are getting them now."—*President James Rowland Angell.*

The Forest Service reports that 36,000 forest fires every year destroy timber and property valued at $16,500,000 in the United States, besides costing many human lives. Be careful with fire in the forests.

Enough immigrants have registered at the American consulate at Kovno, Lithuania, to fill the Lithuanian quota to the United States for seven years.

In spite of repeated warnings, deaths are caused by the operation of automobile engines in closed garages. Carbon monoxide is given off by an automobile engine at all times and is extremely poisonous. When it is necessary to leave the engine running, all the doors and windows of the garage should be open or the car should be driven into the open.

The Bible must be read every day in every classroom in Kentucky "in the presence of the pupils." A teacher's license may be revoked for failure to comply with the law, which passed the house by a vote of seventy-seven to eleven, the senate, thirty-one to one. The governor signed the bill making it the law.

"The International Jew," a four-volume series on the Jewish Question, may be obtained from The Dearborn Publishing Company, Dearborn, Michigan. This set includes:

"The International Jew," Vol. I, 235 pages; "Jewish Activities in the United States," Vol. II, 256 pages; "Jewish Influence on American Life," Vol. III, 256 pages; "Aspects of Jewish Power in the United States," Vol. IV, 246 pages. The price of these volumes is twenty-five cents each; the complete set, four volumes, one dollar.

BINDERS

Readers who desire to save their copies of The Dearborn Independent can now obtain a specially constructed cloth covered post binder. This binder is very practical, holds 52 issues and permits immediate reference to or removal of any copy without disturbing any other issues. Price $2 each delivered. Remittance must accompany orders.

"Cameography" is a new art by means of which it is possible to produce the likeness of the human features by the aid of photography in copper, bronze and other metals, and in marble.

Heat generated by the bodies of chickens roosting in prune trees in an orchard at Marysville, California, is said to have saved the fruit blossoms of those trees. At least, trees not used by the chickens were badly damaged.

There are more than 1,200 properly accredited press or publicity agents in New York City alone. Their work is to get free publics for the individuals or movements that employ them.

America is guilty of wasting from $2,000,000,000 to $4,000,000,000 annually, by burning raw coal in its many scattered little furnaces instead of converting it into electrical energy at or near the mines, and salvaging the by-products that now go up in smoke.

In future the British Government will present every treaty to Parliament for twenty-one days; then ask for ratification. To a great extent this will do away with secret pacts.

A directive type of radio beacon is being used for guiding aircraft. In a recent test the pilot depended for guidance entirely upon the signals received from the beacon. In his ordinary airplane receiving set he heard the letters A and T (- — —) repeated over and over. As long as he flew along the correct course both letters were equally loud, but the moment he got off the course to one side or the other one letter became noticeably louder than the other and showed him which way to turn to get back into line.

The vacuum cleaning process will take the place of the old-fashioned currycomb in the United States Cavalry.

Butler Brothers, merchandise wholesalers, have announced that, in the public interest, the firm has decided to quit selling revolvers and pistols. This action was taken because of the growing sentiment throughout America against carrying concealed weapons.

Alfred J. Pearson, professor of modern languages at Drake University, Iowa, has been appointed Minister to Poland, succeeding Hugh Gibson.

The *American Hebrew* states that hotel exclusion of Jews "from Florida to Maine" have occurred in increasing numbers lately.

The White House needs repairs. It was built between 1792 and 1799 and gutted by fire in 1814 when the British burned it. With only the walls left standing, the interior was rebuilt and to cover the smoke stains it was painted white. It is said to be a firetrap and to fireproof it would cost $400,000. To rebuild would cost $1,000,000.

Six and one-half barrels of crude oil was the per capita measure of consumption in the United States last year.

Herds of goats that went from door to door in Paris in the old days to be milked for the patrons are becoming a thing of the past. Automobiles are crowding the picturesque animals off the streets and it is only in the quieter districts that the goats are milked before the door as of yore.

An aviator who killed a number of wild geese over the Mississippi River in January was apprehended by a game warden employed by the Biological Survey of the United States Department of Agriculture.

"I shall be well enough to hunt before long and I don't intend to follow old women's advice to wrap myself in cotton wool just because I have had a couple of tumbles."—*Prince of Wales.*

A fifteen-story hotel and church will soon be built around and over the old Calvary Baptist Church on West Fifty-seventh street, in New York City, while the congregation will continue to sit in their accustomed pews.

Kentucky is to have a homecoming for a fortnight in June. Adventurers who have traveled far from their native state will come trooping back from north, east, west and south to partake of the hospitality awaiting them.

General Booth, of the Salvation Army, speaking of the effect of the dole system in England, says, "I do not think it is possible for the ordinary reader of these lines to imagine the moral decline, the mischievous influence over all alike, which springs from this evil thing."

Tractors, harvesters or other machinery exposed to the elements or poorly housed, deteriorate in value $370,000,000 a year in the United States.

The Meal Ticket of the Diplomats Is in Danger If Anything Is Settled

By SAMUEL CROWTHER

> **If ever a gypsy horse trader got into high diplomatic circles, he would look back upon his early life as one of honest toil.**
>
> **At home here we have not bothered about reparations because we were not asking to be paid any money. The English people are not bothering a great deal because the political structure built upon getting great sums from Germany long ago collapsed. Its site is marked only by a few tufts from the flowing locks of Lloyd George, who built it.**
>
> **There is no use talking about the morality of reparations. There is nothing moral about war and so it is mere twaddle to talk about the morality of what happens after war. It is purely a question of what you can get away with.**

AN OLD lawyer went off on a vacation, leaving his son in charge of the office. When he got back he asked the son what had been going on.

"I have been working very hard, father. I never thought I could do it and I wanted to finish before you came home. I have settled the Smith estate!"

"Settled the Smith estate!" gasped the father. "Why, don't you know we have been living on that since before you were born?"

That happens to be a very old story and dates back to the first lawyer, but also it happens exactly to tell the story of European reparations in a nutshell. Nearly five years have gone by since the war in Europe officially stopped. Europe has had plenty of little wars and near-wars since November 11, 1918, but none of them has had any social standing. Out of the great war grew a big batch of treaties and in only one of these, the Treaty of Versailles, did the United States have an official part, and that treaty was never ratified by the Senate. (We are at peace with Germany by a separate treaty document.) All the treaties had the following details in common: They provided that the vanquished pay to the victors certain reparations in kind—in cattle, locomotives, freight cars, and so on; that over various terms of years they pay reparations in cash, and finally that each of the defeated nations cede territory either to the victors or to the new nations set up to take it. The territorial cessions have mostly been carried out and so have the reparations in kind, but nothing much has been done about the reparations in cash.

Never Call a Thing by Its Real Name

NOT one of the treaties stands as originally written. For several years the premiers of Europe gave themselves up to selecting pleasant watering places where they might have their photographs taken, issue statements, and talk about the Treaty of Versailles. Lesser diplomats met and talked about the lesser treaties. They did not actually scrap any of the treaties. They just interpreted them according to the way the political wind was blowing. Whenever necessary they found, and without turning a hair, that when a treaty said black the plain meaning of this word was white. Diplomacy has many traditions. Among the more sacred is the one which demands that nothing shall ever be called by its real name, and another is that everything shall be decorous. A third is that a straight line is never the shortest distance between two points. If ever a gypsy horse trader got into high diplomatic circles, he would look back upon his early life as one of honest toil.

As a result of these many conferences, a great many settlements of cash reparations were arrived at, but none of the settlements ever produced any cash to speak of because just as the old lawyer lived upon keeping open the settlement of the estate, so most of the politicians were living upon keeping open these cash reparations. The politicians of the defeated nations have kept their own constituencies in hand by showing how skillfully they could ward off payments, while the politicians of the victor nations have kept up the spirits of their constituencies by promising to fetch home bigger bags of money than were in the world to get.

At home here we have not bothered about reparations because we were not asking to be paid any money. The English people are not bothering a great deal because the political structure built upon getting great sums from Germany long ago collapsed. Its site is marked only by a few tufts from the flowing locks of Lloyd George, who built it.

Europe Is Commission-Crazy

IN the meantime the Allies mobilized a great civilian army to look after reparations payments. We have heard a great deal about the French and Belgian armies in the Ruhr and of the armies of occupation generally. These have been tremendously wasteful in a number of ways. They have wasted the time of the soldiers—that is, men who ought to be working have been kept idle in uniforms. They have wasted the resources of the conquered peoples, both by their keep and by their interference with the ordinary run of life, and also they have wasted the resources of the people at home who in part have been burdened by their keep. But we expect military and naval forces to be wasteful. They are formed for destruction and their wastefulness is blunt and perfectly apparent.

More insidious is the waste of the reparations commissions. The seat of the Rhineland Commission is at Coblenz. There is another big commission at Sofia, and from these and other centers radiate no end of little commissions drawing up reports that no one reads and drawing salaries that someone has to pay. Europe has been commission-crazy ever since the war, and I doubt if there exists in any one place a record of all the international commissions which are scattered over the Continent of Europe. One runs into not only the endless divisions of the reparations commissions but also the commissions connected with the League of Nations. None of these commissions does anything of particular moment. They are all alike in being exceedingly full of red tape and in never putting but one man on a job if ingenuity can find a way to use twenty.

Mystic Maze of Obligations

NOW, all of this mess has grown out of reparations. We think of reparations as a question between France and Germany, but that is merely the most prominent case. All the defeated countries have reparations accounts owing, but also all the victor countries have accounts owing for borrowed money. It will be remembered that only a tiny fraction of the cost of the war was paid by taxation. Part of the cost was paid by the indirect taxation of currency inflation, but the big part was paid by borrowing money, or rather goods, at home or from England and finally from the United States. Up to April 7, 1917, when the United States came into the war, the loans between the Allies amounted to more than eight billion dollars. Then we came in with fresh funds and the Inter-Allied loan account increased by fifteen and a half billion dollars. The post-Armistice loans and the interest brought the account up to more than twenty-eight billion dollars. Three nations did all the lending—Great Britain to nearly twelve billions, the United States to eleven billions, and France to over three billions. But Great Britain and France were borrowers as well as lenders and in the net account we came out as creditors for nearly twelve billions and Great Britain as a creditor for more than four and a half billions. All the other Allied nations are debtors.

There would seem to be no connection between reparations payments and the Inter-Allied debts, and actually there is no connection, but the Allies, other than Great Britain and the United States, are all owed fantastic sums in reparations. At the same time they owe for money borrowed. And so they say that they cannot think about paying their debts until the reparations money is paid to them. Out of all this has grown a perfect maze of obligations which are kept in the air by political juggling, and because they have been kept in the air everything else has been kept in the air. No one has wanted to face the realities of peace. A man who tries to live on nothing a year has to spend a good deal of his time stalling creditors. The Allied nations owe more money than they can pay and, broadly speaking, their only assets are a lot of bad debts. There is just as much chance of collecting money from Austria, Hungary, Bulgaria, and Turkey as there is of collecting from the moon. In fact, this has been officially recognized by moratoriums.

Germany, as the richest of all the Central Powers, is the only debtor that has been kept in the running, for Germany undoubtedly could pay something and then again the national bookkeeping of France required that at least some of the accounts receivable be retained as good. This national bookkeeping has had a great deal to do with prolonging the trouble about reparations.

The state of mind is a perfectly familiar one. We see it every day about us. When a merchant's business starts to go bad, he invariably makes out a false statement of condition. I am not speaking of the dishonest man but of the man who tries to be honest. He probably has a great number of bad debts. If he crosses these out of his assets, he will on paper appear to be insolvent. If he includes every possible sum owing to him, whether or not he can collect it, then he can appear on paper to be solvent. If he can dress his bad debts up nicely, maybe he can borrow money on them. During our big slump of 1920-21 some banks were so heavily involved that they actually kept hopelessly insolvent concerns from failing just so that their notes would not have to be withdrawn from the bank's receivables.

The Continental Allies have, with a few exceptions, gone these familiar plans one better. In their statements they have included the reparations owing to them as assets and their own debts as liabilities, or they have included the reparations and forgotten their own debts, or forgotten both accounts. The defeated nations have not bothered to include the reparations as debts because the sums have been so out of reason as to make any balance sheet containing them absurd.

If Justice Ruled—

THERE is no use talking about the morality of reparations. There is nothing moral about war and so it is mere twaddle to talk about the morality of what happens after war. It is purely a question of what you can get away with. A German thinks it perfectly shocking to have the French bent on destroying Germany, but he sees nothing out of the way in the Germans destroying Northern France. A Frenchman is shocked by the German destruction of Northern France and cannot see why anyone should possibly object to his smashing Germany. War is war, and that is all there is to it. If justice ruled, there would be no war, and it is all nonsense to talk about a just peace. If a just peace were possible after a war, then there never would have been a war.

The Versailles Treaty, for instance, had nothing to do with justice. That question was not involved. The sole point was how much the Allies could get. The treaty was bad because it fundamentally lacked common sense in that the Allies asked more than they could get. Now, after five years, an American commission has applied common sense to the problem.

The French have been using crude credit methods. They had been pulling the strong-arm stuff, which presumes that if only you beat up a man enough he will find the money with which to pay you. The Dawes Commission has recommended not more moderate but more modern measures. Your modern credit man rarely sells out a debtor, for not only does he seldom get enough out of the sale to pay him, but also he destroys a customer. He finds that it pays better to nurse the debtor along.

Rights, Wrongs and Responsibilities

NOW, the important part of settling this reparations is not the money that will pass. Probably in the end not very much money will pass. The important thing is to pull assets and liabilities out of the air and set them down on paper as real facts. Financiers of the European governments have been playing with the fairies so long that now only the fairies will take the money they issue. With the French and German question open, every old question could be kept open and a few new ones started. It is very easy to keep people worked up by political promises. If you keep a man's attention focused on his rights and his wrongs, he will easily forget his responsibilities. On the other hand, a man who thinks first of his responsibilities usually finds that he gets what is coming to him in the way of rights.

Europe has been rather generally evading its responsibilities. Any idiot can talk about rights. It takes a wise man to consider responsibilities. Who gets what in Europe is not of the remotest concern to real citizens of the United States. Of course many of our aliens are concerned, but their concern is of no moment. We, as citizens, are interested only in seeing the prosperity of Europe—Europe as a whole—brought about. We can gain nothing by mixing in family quarrels. A poverty-stricken Europe does affect us. How it affects us and what the new and latest plan—the Dawes plan—is, and how it may be expected to work out will be the subject of the next article.

Taking the Cruelty Out of the Movies

Answer to Clever Animal Acting Found in Abuse and Ill Treatment

By HARRY H. DUNN

WHEN a man beats an animal unmercifully in public he is punished for it; when a man transports living animals, either on foot or in trains, he is compelled by law to see to it that they have abundant water and food, that they are not driven at an excessive rate if on foot, or crowded too closely if in cars; if a man assumes the responsibility of ownership of animals, either for industry or as pets, his city, state and national governments combine to see, as far as humanly possible, that these animals get a "square deal." Yet ever since motion picture making became an industry, and more especially since it was learned that animals, both domesticated and wild, could be made to perform before the camera, the studios making these pictures have been the scenes of almost unbelievable barbarities and cruelties toward dumb and defenseless animals that, if the full story could be told, would minimize the tortures devised by Torquemada and his human fiends in the days of the Spanish Inquisition.

With not more than three exceptions—and at least one of these forced by the hands of a band of earnest women —the animals used in these pictures have been, and to some extent still are being, trained by cruelty alone. When they are not needed on location, they are neglected in their quarters, left a prey to thirst and hunger and the whims of ignorant, careless and often vicious keepers, masquerading as "animal trainers." When they are on location, they are doped with drugs, made wild with moonshine whisky, beaten with whips into whose lashes steel wires have been woven, pounded with clubs, directed by collars through which spikes are driven, pointing inward to their tender throats, and, in many instances, strung on wires, which are pulled hither and yon to make the poor animal go through the motions of action which it could have been taught to do by kindness, had the trainer had either the intelligence, the patience or the industry to train his animal in a proper and humane manner.

These statements apply with equal force to wild animals "trained" in shows and circuses, and to domestic and wild animals taught to perform tricks on the vaudeville stage. They are not random instances, picked with an eye to criticism, but the result of the researches of an organization formed less than a year ago to combat cruelty to dumb animals in all forms of exhibition. Proof of every one of these charges, and of worse, is on file in the headquarters of this organization, in Los Angeles, where, in the center of the motion picture industry of this country, some progress has been made in obtaining better treatment for animals, both on and off "location," that is to say, both when at work in the pictures and when in their cages or yards in the motion picture "zoo."

In one recent motion picture, more than two hundred cattle and horses were destroyed in the fording of rivers. This picture showed the movement of an emigrant train westward, shortly after the Civil War. Animals were driven indiscriminately into the streams to sink or swim, survive or perish, so that "realism" could be added to the film, and the childish minds of the average motion picture audience could be given another "thrill." A horse, which played a leading rôle in another picture, was tied on wires, doped, his feet bound with wires, so as to make him limp with "weariness," and otherwise maltreated, until, at the close of the making of this "film of the wild," the splendid animal was shot, after patiently enduring untold sufferings for several days.

A writer in the *Daily News* of Santa Barbara, describing the filming of "The Ten Commandments," widely blazoned as a "two-million-dollar spectacle," describing the dash of the Egyptian soldiery after the fleeing children of Israel, says:

"In the van of the stampede was a span of black thoroughbreds, which Mr. De Mille (the director, Cecil B. de Mille) had bought in Kansas City, to add beauty to the setting. When the stampede was over, four men lay in the sand, badly hurt. Horses were lamed. One horse, goaded beyond endurance by its injuries, pulled away from its mate and fled over the sand dunes. A square foot of its flank, ripped or kicked open into a right-angled tear, flapped on the wind like a red bandana."

This writer continues to tell of other maimed and ruined horses, permanently damaged in this mad "spectacle," but there is no word to indicate that any attempt was made to overtake these animals, to ease their sufferings, or even to kill them to put an end to their pain. Outlaw horses were introduced into the stampede to arouse and excite the tamer animals, spurred to madness by the "Egyptian soldiers," to make a show, not for Nero or Tiberius Caesar, but for civilized Americans in the midst of the twentieth century.

Late last year, an investigator for the new organization for the defense of these dumb creatures found an elephant at Universal City, which had been so badly beaten that one eye was knocked out, and a deep, untended gash had been cut in his forehead. This elephant was one of the best of his kind, gentle, and of such good disposition that he had once stopped a stampede of circus elephants in San Francisco during a parade. Falling into the hands of a typical motion picture "animal trainer," he had been so badly beaten that there was nothing left to do but kill him. It is pleasing to note that, before he died, he nearly killed the keeper who had maltreated him.

STRONGHEART

Circle—**MRS. ROSEMONDE RAE WRIGHT**, vice-president, office-manager and lecturer for the American Animal Defense League. Above—"Strongheart," and, at left, his "fingerprint." This is the only animal in motion pictures of whom it has been definitely proved that his training was all done by kindness. "Rin-Tin-Tin," a dog trained by the most brutal methods in Germany, has fallen into the hands of an American trainer, who declares that it required many months to get fear out of the poor dog's mind. Since coming to America this dog has been trained by kindness only. Right—**MRS. FANNIE THOMPSON KESSLER**, president of the American Animal Defense League, which is carrying on a nation-wide campaign against cruelty to animals in motion pictures, on the stage and in circuses.

In another instance, in which a dog was supposed to be wounded and to be crawling through deep snow to his master's cabin, the feet of the animal were bound so tightly with wire that he could not walk, his cramped toes causing the expression of agony caught by the camera, transferred to the film, and called "art" by the director. This dog was literally strung on a wire, the steel filament being passed between his legs along the length of his belly, so that his weight rested on it. The wire was then jerked slowly forward, to simulate the appearance of the crawling of a wounded animal through the snow.

To combat this cruelty, a number of men and women, prominent in all lines of life in the West—where the majority of the motion picture zoos are maintained—have organized the American Animal Defense League, of which Mrs. Fannie Thompson Kessler is president, and Mrs. Rosemonde Rae Wright vice-president and lecturer, actively in charge of the headquarters in Los Angeles. The late George Wharton James, an authority on the Indians, as well as the wild animal life of the West, also was a vice-president, and among the honorary vice-presidents who take an active interest in the work are Minnie Maddern Fiske, General Nelson A. Miles, John Galsworthy, George Arliss, Maurice Maeterlinck, Prince Paul Troubetzkoy, and Governor Percival P. Baxter. Mrs. Wright, for the past ten years, has been president of the California Anti-Vivisection Society, one of the most powerful humane organizations in America, and formerly was head of the Humane Animal Commission of the City of Los Angeles. Virtually all her life has been devoted to the defense and protection of dumb animals.

"The purpose of the American Animal Defense League," Mrs. Wright said to me a few days ago, "is to arouse the conscience of the American people to a realization of the appalling cruelty practiced in the training of animals for the stage and for the circus, and in their use in motion pictures. Such cruelty, reflected to millions of minds through the tremendous distributing agency of the motion pictures, constitutes a menace to the impressionable minds of children, and even to the thoughts of men and women. A prominent motion picture producer recently said to me: 'The average motion picture audience represents a mentality of nine years.' To such a mentality brutal cruelties, even though they may seem shocking at first, soon become ordinary matters, and the humane and protective sensibilities become dulled and dormant.

"Except in rare instances, the 'trained' animals seen in vaudeville, in circuses and in motion picture zoos represent unspeakable suffering. Made to travel thousands of weary miles in cages scarcely large enough for them to stand upright, starved, beaten and abused, they represent the epitome of cruelty. Can the American people afford to purchase pleasure that involves torture to sentient creatures, simply because those creatures are in the power of brutal, hardened trainers?

"When you see an animal on the screen pulling frantically at some unseen object, or held rigid by an invisible force, you may know that the poor creature has been 'wired' with fine piano wire, virtually invisible to the camera. This is the most common trick in compelling animals, both wild and domesticated, to perform before the camera. It is unspeakably cruel and often permanently damaging to the animal, who fights against his wire bonds and cuts his flesh to the bone. 'Doping' animals, both wild and domesticated, with cocaine, morphine, strychnine and other drugs is all too common in so-called 'animal pictures,' and, almost without exception, leaves the animal to die a lingering death. This 'dope' is resorted to by unscrupulous and impatient directors and ignorant, brutalized trainers when they desire some action impossible to obtain without long, patient and kindly training.

"The frightened animal is dragged from his cage, clubbed, shouted at and thrown into 'position.' If he does not hold that position, as he rarely does, being frightened nearly to death, the 'dope needle' is called for, and another helpless, harmless animal pays the price of his life for a few feet of film."

One of the first acts of the new animal defense organization was the cleaning up of the Universal City zoo. Under the spur of Mrs. Wright's investigation, the president of the Universal Pictures Corporation, Carl Laemmle, made such sudden reformation in the staff and methods of conducting this zoo that most of the "trainers" have not yet found out just what happened to them.

"When I arrived at the Universal City zoo on July first," said Mrs. Wright, "it was an exceedingly warm day, but there was not a drop of water in any of the cages. The animals were suffering, both from lack of water, and from close confinement in unsani-

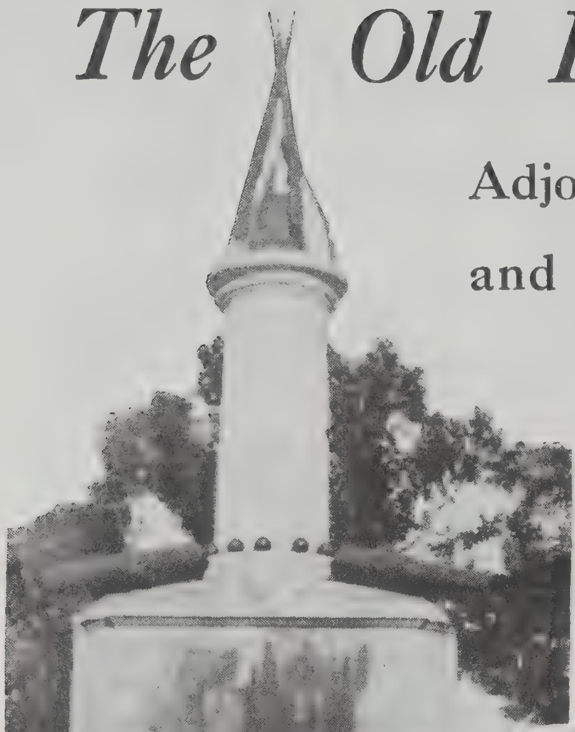
(*Concluded on page 13*)

A motion picture troupe "on location" for "frozen North" pictures made in the snow-clad mountains of California. It is claimed, without denial, that the fate of dogs, horses and other animals used in these pictures is of no importance to the producers, so long as the momentary "action" required of the unfortunate dumb beasts is obtained.

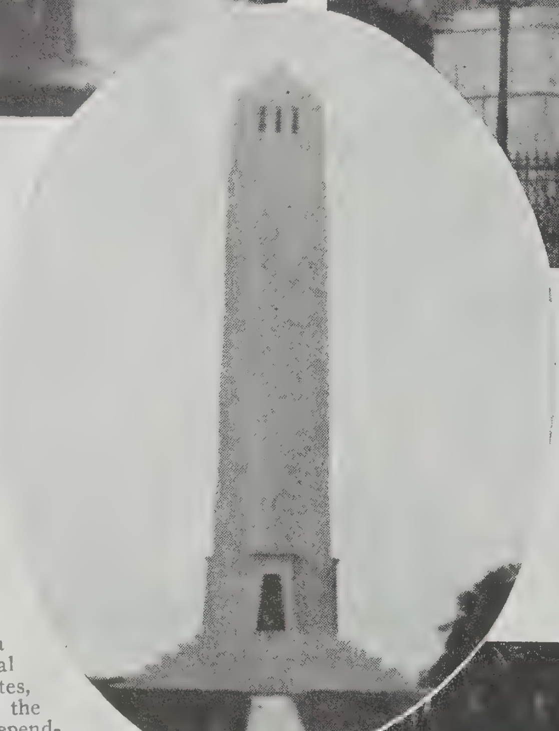
The Old French Parish of St. Bernard

Adjoining New Orleans, as Full of Historic Interest and Romantic Associations as the City Itself

By MARIE LOUISE POINTS



Monument erected to the Union dead in Chalmette Cemetery.



Above—A view of the Jackson Monument, New Orleans, with the Cabildo" or ancient government house and the "Presbytere," now the museum, on either side.

Left—The Chalmette monument which marks the site in St. Bernard Parish where the Americans under General Jackson defeated the British, January 8, 1815.

LONG ago, a Louisiana poet, in a burst of enthusiasm, wrote, "Oh! the dryness of my studies has fled; there is poetry in the very foundation of this remarkable land!" To no portion of Louisiana could this apostrophe be more fittingly applied than to the ancient Parish of St. Bernard. Rich in natural resources, and geographically one of the most happily situated in the state, it is a parish abounding in romantic associations and traditionary lore; it is a landmark in the agricultural progress of the United States, and the section which set the historic seal upon the independence of the American Republic; for it was in St. Bernard Parish that the principal industry of Louisiana, the granulating and refining of sugar, had its birth; and it was beneath the venerable oaks of Camp Chalmette that the English under Pakenham met an American Waterloo.

St. Bernard Parish extends southeast of New Orleans for a distance of twelve miles along the left bank of the Mississippi River, from the Jackson Barracks to the English Turn, and thence obliquely to the South, following Bayou Terre-aux-Boeufs and Lake Lery to the sea. The Shell Beach Railroad which traverses the parish brings it in touch on one side with New Orleans, the most important market of the South, and on the other puts it into communication with the Gulf of Mexico, the unique mouth of the Mississippi. The "English Turn" is so-called because here in 1699 the English, under Captain Barr, turned back when informed by Bienville that the French were in possession of Louisiana. St. Bernard has long been regarded as a favored spot in Louisiana. The air is pure and salubrious, refreshing breezes coming from all points, the Mississippi River on the right, the Gulf of Mexico on the left, and Lake Borgne on the north. The entire parish is formed of alluvial soil, brought down by the river in its course to the South, and this double work of nature has not only enriched the earth, but has made the parish high, healthy and singularly free from inundations from the river, except in case of an unprecedented rise. The deposits from the river have given richness and variety to the soil, and made it adaptable to the culture of fruits, vegetables, and Louisiana's great staple, sugar cane. The orange and fig find here their natural home. The lakes and bayous are stocked with fish and oysters, the finest in the Louisiana waters. The great plantations of ante-bellum days have given place mostly to truck farms which supply fruits and vegetables to New Orleans and other markets. Tourists to New Orleans never fail to visit the orange groves in St. Bernard.

In 1778 the Colony of St. Bernard was founded by Don Bernardo de Galvez, who was the governor of the Province of Louisiana under the Spanish Domination, from 1777 to 1783. Galvez belonged to one of the most powerful families of Spain. His father was the Viceroy of Mexico, and his uncle was the chief minister of King Charles, the then reigning sovereign of Spain. Galvez was the youngest governor Louisiana ever had, being only twenty-one when he entered upon his high duties. He was filled with the desire to win over the affections of the French settlers who had never been reconciled to the cession of Louisiana to Spain. His first act was one of great prudence. He sought to extend the commerce of the colony, and not only revived the hopes of the colonists by enabling them to get better prices for their products, but he removed the restriction which had been placed upon their exports since the days of the first Spanish governor, and permitted them to export their products to any of the French ports.

The people took heart and were still further encouraged when, in 1778, Governor Galvez, at the King's expense, caused a large number of colonists from the Canary Islands to be brought to New Orleans and settled them in the section just below the city. There were 150 families in all, and Governor Galvez called the spot in which they located "New Galvez" to distinguish it from "Galveston," a colony which he had founded on Manchac, not far from Baton Rouge. But the people of New Orleans insisted upon calling the entire parish "St. Bernard," after the patron saint of the governor; and St. Bernard it remains to this day. In January, 1779, five hundred more colonists arrived from the Canaries, and Governor Galvez distributed them between St. Bernard Parish and the Bayou Teche district. In St. Bernard the descendants of these colonists are still known under the name of "Islingues," a name derived from the Spanish word "Islenos," meaning islanders. The town of New Galvez was afterward called "Terre-aux-Boeuf," because the colonists used oxen in working the soil. Even now, the village next to St. Bernard carries the name of "Terre-aux-Boeuf,"—"The Land of Oxen."

Governor Galvez had great plans for his favorite colony. He marked off at equal distance from the Mississippi River a spot for a residence and a church. Up to a few years ago the remains of the beautiful house which he built could still be seen near the post office. The church was built after his orders on a front line facing Lake Lery, three miles distant. The old parish register still contains the names of these first worshipers from the Canary Islands. Among them are the names of Estopinal, Nunez, Solis, Serpas, Marrero; later French settlers gravitated to the parish, and established themselves in handsome plantation homes. Among the descendants of these pioneers are the Livaudais, Olivier, Villere, Beauregard, Mendes and Ducros families. Three of these, Mendes, Villere and Beauregard, were destined to write the name of the ancient parish high in the annals of the state.

The administration of Bernardo Galvez was one of the most famous in the history of colonial Louisiana, because of his brilliant enterprises against the English posts during the Revolutionary War. It is one of the traditions of St. Bernard Parish that through the patriotism of Galvez, the old Franco-Spanish Province of Louisiana was brought into the war and did its share toward winning the independence of the union of which it subsequently became a part. For France, the ally of Spain, having recognized the independence of the United States after having had her propositions for peace rejected by England, declared war against that country in 1779. Governor Galvez, who was young and fired with sympathy for the American cause, called a mass meeting of citizens of New Orleans and St. Bernard, and after telling them that war had been declared by Spain against the English, exclaimed, "Let those who love me follow where I lead!" Fifteen hundred young Creoles, as the pure-blooded French and Spanish colonists were called, responded to his appeal. Through all the fortunes of war they remained true to their brilliant young governor, who captured the English posts at Fort Manchac, Baton Rouge, Natchez and Mobile, and proceeding against the strongly fortified post of Pensacola, forced the English to surrender. The result of the campaign was that the whole of West Florida, which had fallen into the hands of the English, was restored to Spain, the English were driven from every post in the Province of Louisiana, and Louisianians have always felt proud that, though under the Spanish flag, they thus assisted the Americans in their struggle for independence.

In 1783, when the treaty of peace between the United States, Great Britain and Spain was signed, "the navigation of the Mississippi from its source to its mouth" was declared free to the people of the United States. A few months later, when Governor Galvez was disbanding his troops, he dwelt upon the importance of the free navigation of the Mississippi, and how St. Bernard and New Orleans, with their strategic position at its mouth, must in time become the gateway for the traffic of two continents. No colonial governor of Louisiana could ever lay claim to such honors as the founder of St. Bernard Parish. The Spain of that day did not forget, and when Gov-

ernor Galvez' father died in 1785, his son was appointed his successor as Viceroy of Mexico.

It is the pride and glory of St. Bernard Parish that it was the cradle of the sugar industry in the United States. The cultivation of sugar cane was first introduced in Louisiana by the Jesuit Fathers in 1751, an attempt being made by them to manufacture sugar on their plantation in Baronne street, New Orleans, in the spot where the Jesuits' church now stands. But the attempt proved a failure. At this time indigo had been for many years the chief industry of the colony. The soil of Louisiana was still undeveloped. No one dreamed of the possibilities of culture that lay hidden like a mine of gold within it. In 1791, an insurrection of the Negro slaves in the French island of San Domingo drove hundreds of wealthy, educated, white refugees to New Orleans. They brought with them a wealth and luxury unknown before in the colony. Many of these refugees, being accustomed to large plantations, settled in St. Bernard Parish. Among them was a Spaniard named Solis, who laid out a large plantation on the site of the present little village of Bencheque, a portion of which afterward comprised the well-known Olivier plantation. In 1791, Solis essayed to manufacture sugar from cane, using a wooden mill. He succeeded only in making syrup and an indifferent quality of rum called "tafia," which he placed on the market.

Adjoining the Solis estate was the magnificent plantation of Don Antonio Mendes. This remarkable man was fully convinced that sugar could be manufactured from cane in Louisiana. Later in 1791, he bought out the Solis plant, erected the mill on his own grounds, and, with determination to succeed, he secured the services of a sugar maker from Cuba named Morin. Morin had spent many years in San Domingo, where the manufacture of sugar from cane was no secret. Many planters interested in Mendes' venture gathered in St. Bernard to witness the experiments. One can imagine their interest, how anxiously they gathered around the ancient wooden mill and the enthusiasm that filled the air when the historic words, "Ça Granule"—"It granulates!" burst from the lips of Mendes. This was the first sugar ever made in Louisiana.

The most romantic memories of St. Bernard Parish are connected with stories of the famous pirates, Jean and Pierre Lafitte. Jean Lafitte, the leader, was a handsome, dashing man, brave and reckless in all his acts. He had his trysting place in the island of Grand Terre in Barataria Bay. "Barataria" is an adaptation of a curious old Creole word, "Barateur" or "Barato," signifying "cheap," as the smuggled goods, rare and beautiful, sold by the pirates, were very cheap. Lafitte's crew were desperate men of all nations, contrabandists, pirates and what not. They were known in New Orleans as the "Smugglers of Barataria Bay," or more generally as "The Pirates of Barataria." They were the "wild men of the Spanish Main," and it was darkly hinted that they carried the black flag, and attacked vessels of all nations and did not hesitate to make their prisoners "walk the plank," that terror of old pirates of the deep.

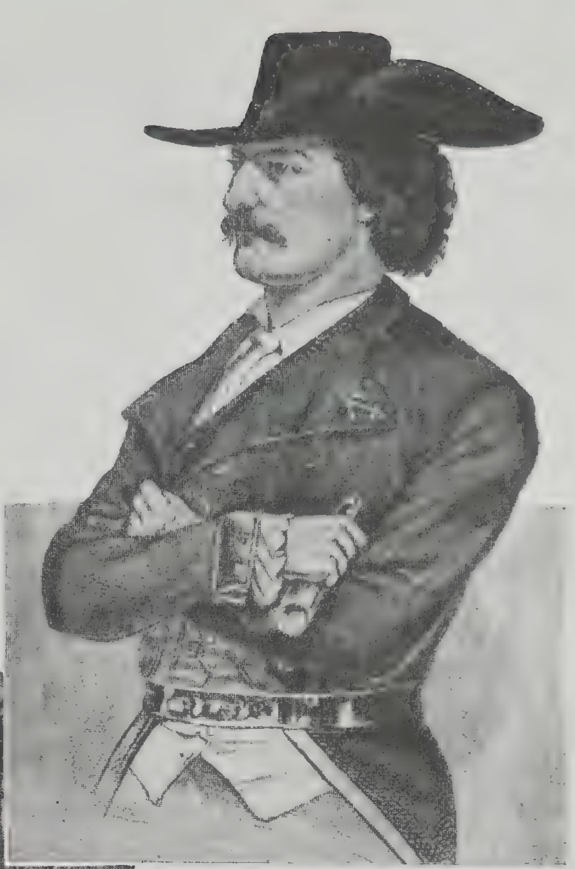
The Lafitte brothers had a smithy in Bourbon street, in New Orleans, and whenever the hand of the law seemed about to fall upon them, they would come out of the fastnesses of Barataria and sit smilingly in their blacksmith shop, which the Creoles said on the sly was not altogether a blacksmith shop, but a hiding-place for the city sale of their smuggled goods. Governor Claiborne, the first American governor of the territory and afterward of the state of Louisiana, sought to capture Lafitte and his men because they were engaged in a large smuggling trade. But the various expeditions sent against them did not succeed, because the people, who could buy goods from them much more cheaply than anywhere else, sympathized with them and always warned them when any expedition started.

But Lafitte had made up his mind. Mounting his horse he rode quickly to New Orleans, and suddenly appeared at General Jackson's headquarters. Jackson had heard of the Baratarians; he had been warned against the robbers and "pirates." Jackson was very much in need of arms and flints and accepted Lafitte's offer and Lafitte turned over his men and arms. On the day of the great Battle of New Orleans the Baratarians distinguished themselves. Lafitte and all his men fought so gallantly that they received General Jackson's thanks in a "General Order." Afterward President Madison granted all the outlaws a full and free pardon.

A fact which reflects credit upon the parish is that the first steam engine ever used to grind sugar cane was put up on the site of the plantation of Jean Joseph Coiron, in St. Bernard Parish in 1818. Two years later Coiron introduced the first red-ribbon cane from Georgia. These improvements operated most advantageously for the success of the industry, and Coiron's name lives in the agricultural history of Louisiana as the great promoter of the sugar industry in the early part of the nineteenth century, as De Boré was in the latter part of the eighteenth.

The battle field of Chalmette where the famous Battle of New Orleans was fought January 8, 1815, lies about a mile and a half from New Orleans in St. Bernard Parish. The British expedition, directed against the city of New Orleans, formed part of a grand movement inaugurated by the English for the capture of Mobile also, in the latter part of the war of 1812. The troops destined for these operations united at Jamaica. They included a detachment of veterans who had served under Wellington on the Continent, and a portion of the British Chesapeake force under Admiral Cockrane. Intelligence of the English preparations reached Washington, December 9, 1814. The President immediately directed the governors of Kentucky, Tennessee and Georgia to dispatch their militia to New Orleans. General Andrew Jackson went to the city to take charge of the defense. He reached New Orleans December 12, 1814, and promptly began the organization of a force. The citizens rallied to his assistance; he also enlisted convicts and free men of color. With the volunteers from other states, Jackson's force was speedily swelled to 5,000 men, of whom less than 1,000 were regulars. The British expedition was composed of 7,000 men. The British were afterward reinforced by a detachment under General Lambert, one of Wellington's officers; this increased their numbers to 10,000 men. Transported in fifty large vessels, the British made the voyage to the Louisiana coast in safety, and anchored at the entrance of Lake Borgne in St. Bernard Parish. They believed their near approach to within nine miles of New Orleans by December 23 was unsuspected. But Jackson had received warning and, boldly advancing toward the enemy on the evening of December 23, attacked the British who were under the command of General Pakenham. He did little other than to show that he was prepared to make a gallant defense. On December 28, the British made another attack, but were repulsed with a loss of 213 men. On January 8, 1815, early in the morning, Pakenham made a desperate attempt to carry the American position by assault. Jackson was now encamped on the Plains of Chalmette about four miles below New Orleans. General Pakenham was mortally wounded and was borne off the field to die. General Gibbs, his second in command, was also mortally wounded, and General Keane, upon whom the command devolved, was shot in the neck. The command then fell to General Lambert, who abandoned the attack and withdrew his men to Lake Borgne, whence they sailed away in a few days. The battle had lasted scarcely more than an hour. By 9:30 a. m. it was over. The American loss was only thirteen killed and wounded. The British lost 2,600 killed and wounded.

Early in February news reached New Orleans that peace had been declared between the United States and England December 24, 1814. Thus the Battle of New Orleans was actually fought after peace had been declared, though neither army knew it. But the importance of the battle was recognized by Congress, which passed resolutions complimentary to the people of Louisiana for the valor with which they had defended their soil.



JEAN LAFITTE,

Commander-in-Chief of the "Barataria Pirates."

Above — Lafitte's oak. Historic live oak in the wilds of Barataria Bay, under which Lafitte and his pirates held their trysting place.

Right — Facsimile of Jean Lafitte's "Grand Mansion" in the fastnesses of Barataria Bay where he entertained governors and government officials in lavish style.

Above—General Jackson's headquarters. Historic Beauregard Mansion in St. Bernard Parish in which General Jackson made his headquarters during the Battle of New Orleans, 1815. Below—The Chalmette Cemetery, purchased in 1865 by the United States Government, a portion of the old battle ground in St. Bernard. It was converted into a beautiful burial place for the Union soldiers of the Civil War.

The Chalmette Monument marks the place where the battle was fought. It stands on the grounds of the ancient plantation of Monsieur Chalmette de Lygny, whose descendants still reside in the "vieux carré" of New Orleans. The venerable Madame Zoe Chalmette de Ligny Peychaud, daughter of the colonial owner of this historic ground, lived to the age of ninety-five, and many a time did the writer, in childhood, hear from her own lips the story of the Battle of New Orleans, and how she was among the young girls, representing the states and territories of the Union, who afterward strewed the pathway of General Jackson with flowers at the public reception tendered him in New Orleans.

The battle ground is now under the care of the patriotic association of the Daughters of 1776-1812.

And so from plantation to plantation, one may go in the old parish, hearing the songs and stories of other days, how one after another had passed from the hands of the ancient owners, till one reaches again the boundary line which separates the parish from New Orleans. There stands a large old colonial building, the last relic of the old life. It was the home of Francois Le Beau, a wealthy sugar planter and was erected more than one hundred years ago.

But the people of St. Bernard are optimistic. They do not believe that the glory of the old parish has departed forever. Rather do they feel that the best is yet to be. For the people are coming unto their own. The great wealth of the parish is no longer concentrated in the hands of a few landed proprietors. Plantation sites have been cut up into truck farms, swamp lands are being reclaimed, on all sides the hum of industry is heard, and the land is being made to yield substantial returns. Besides truck farms, much of the vacant land on which sugar was formerly cultivated has been converted into rice lands and the yield has been a prolific source of revenue to the people.

Interest of late, too, has settled around the old battle field. The Daughters of 1776-1812 and the Colonial Dames will have joint charge of this historic area, which the United States Government proposes to convert into a great national park. When the plans elaborated for its improvement are completed, the park will be among the most beautiful in the United States. The live oaks alone will be an attraction, for the "Avenue de Versailles," which runs through the grounds, is said by botanists to contain the most magnificent growth in the world.

Cronkhite Case to Trial: Highest Court Order

Rosenbluth and Pothier Surrender for Journey Back to Tacoma

By CHARLES ALBERT COLLMAN

THE many obstructions which, for the last three years, were placed deliberately in the way of the administration of justice in the Rosenbluth case, have at last been brushed aside as irrelevant and immaterial by a ruling of the United States Supreme Court, which sustains the action of United States District Judge Arthur L. Brown, of Providence, Rhode Island, in issuing a warrant for the removal of Roland R. Pothier to Tacoma, Washington, there to stand trial for the murder of Major Alexander P. Cronkhite.

Readers of THE DEARBORN INDEPENDENT will recall that more than a year ago, on April 7, 1923, it pointed out the strange inconsistencies in the removal proceedings instituted against Pothier in Providence, as compared with those against Robert Rosenbluth in New York City. The two men had been indicted on the same counts and for the same crime. Bench warrants had been issued against them from the United States Court for the Western District of Washington (Tacoma), charging them with willful and premeditated murder. But while in Rhode Island Pothier's case was properly laid before the United States District Court, Rosenbluth's case, in New York, was presented for adjudication to a United States commissioner, one who acts merely in a clerical capacity for the district court. Pothier was imprisoned during the course of the hearings, but in New York Rosenbluth was promptly liberated on bail. In Providence Judge Brown decided that the bench warrant for Rosenbluth had been issued by a court of competent jurisdiction and granted a warrant for the man's removal to the State of Washington. In New York the commissioner, after protesting that he should not have been called upon to take the responsibility for a decision, discharged Rosenbluth's bail and dismissed the proceedings against him. Rosenbluth thus walked the streets of New York a free man while Pothier languished in a Rhode Island jail. The strange spectacle was presented of a United States commissioner in New York nullifying the act of a United States Court in Washington, and ignoring an indictment for a capital crime found by a Federal grand jury.

The Supreme Court Ruling

IN NEW YORK no attempt was made to review the action of the commissioner. In Rhode Island, however, the removal of Pothier was again contested by an appeal to the United States Circuit Court of Appeals in Boston, which later liberated Pothier, holding that there was an "absolute want of probable cause" for the removal of Pothier to Tacoma.

The case now went to the Supreme Court *of the United States which sustained Judge Brown and reversed the decision of the United States Circuit Court in Boston, thus automatically nullifying the action of Commissioner Hitchcock in New York in liberating Rosenbluth.*

The ruling of the Supreme Court is as follows:

SUPREME COURT OF THE UNITED STATES.

No. 546.-October Term, 1923.

William R. Rodman,
United States Marshal,
Petitioner,
vs.
Roland R. Pothier

On Writ of Certiorari to the United States Circuit Court of Appeals for the First Circuit.

(April 7, 1924.)

Mr. Justice McReynolds delivered the opinion of the court.

Respondent Pothier and another were duly indicted—October 13, 1922—for the murder of Alexander P. Cronkhite, on October 25, 1918, "within and on lands theretofore acquired for the exclusive use of the United States, and under the exclusive jurisdiction thereof, and within the Southern Division of the Western District of Washington, to wit, within and on the Camp Lewis Military Reservation." Pothier was arrested in the State of Rhode Island and, after hearings before the Commissioner and the District Court, a warrant for his removal was directed as provided by sec. 1014, Rev. Stat. By this *habeas corpus* proceeding the validity of the warrant is questioned and respondent's release sought. His contention is that the United States had not acquired exclusive jurisdiction over the place of the crime as alleged by the indictment because they had not then received a deed to the land.

The District Court said and held, 285 Fed. 632—

"The argument is that by the terms of the statute the passing of the deed is a prerequisite to the exclusive jurisdiction of the United States, and that as the deed postdates the time of the alleged murder, the United States did not then have exclusive jurisdiction over the lands conveyed by said deed. But the evidence shows also that before the passage of the deeds, and before the date of the alleged murder, Pierce County, acting as the arm and agent of the State, had acquired by condemnation, and had turned over to the United States military authorities many tracts of land comprised within the Camp Lewis Military Reservation, which had been selected by a representative of the Secretary of War, and which, when donated to the United States, the Secretary of War had been authorized to accept. Buildings had been erected and the camp permanently occupied before January 29, 1918, and before July, 1918, there were 50,000 men in camp. There is much evidence tending to show that as to a number of the tracts of land comprised in the camp there was, before the date of the alleged crime, a practical consummation of the donation, and that the agents of the county and of the United States had done all that it was necessary to do to vest title and exclusive jurisdiction in the United States, save the execution and recording of the deeds whereby the title of the United States should be evidenced. The contention of the United States that the evidence of *de facto* exercise of exclusive jurisdiction is sufficient in itself to show probable cause cannot be disregarded, in view of the *quaere* in *Holt* v. *United States*, 218 U. S. 245,-252: 'The documents referred to are not before us, but they properly were introduced, and so far as we can see justified the finding of the jury, even if the evidence of the *de facto* exercise of exclusive jurisdiction was not enough, or if the United States was called on to try title in a murder case.' . . . I am of the opinion that the defendant has failed to overcome the *prima facie* case made by the indictment, and that the evidence fails to show the want of probable cause."

The Circuit Court of Appeals, 291 Fed. 311, was "of the opinion that no other conclusion can be drawn from the evidence than that, at the time the crime charged in the indictment was committed, the United States had acquired no title in the land embraced within Camp Lewis Military Reservation; that the sovereignty of the State over the tract had not then been yielded up and was not until the deed, map, etcetera, were filed in the office of the County Auditor of Pierce County for record, which was not until November 15, 1919, more than a year after the alleged murder. This being so, there is an absolute want of probable cause for the removal of the appellant to answer to the crime charged. *Green* v. *Henkel*, 183 U. S. 249, 261." It accordingly reversed the judgment of the District Court and directed Pothier's discharge.

We think there was enough to show probable cause and that the judgment of the District Court is correct. Whether the "locus" of the alleged crime was within the exclusive jurisdiction of the United States demands consideration of many facts and seriously controverted questions of law. As heretofore often pointed out, these matters must be determined by the court where the indictment was found. The regular course may not be anticipated by alleging want of jurisdiction and demanding a ruling thereon in a "habeas corpus" proceeding. Barring certain exceptional cases (unlike the present one), this Court "has uniformly held that the hearing on 'habeas corpus' is not in the nature of a writ of error, nor is it intended as a substitute for the functions of the trial court. Manifestly, this is true as to disputed questions of fact, and it is equally so as to disputed matters of law, whether they relate to the sufficiency of the indictment or the validity of the statute on which the charge is based. These and all other controverted matters of law and fact are for the determination of the trial court." "Henry v. Henkel," 235 U. S. 219, 229; "Louie v. United States," 254 U. S. 548.

Reversed.

A true copy.

Test:

Clerk, Supreme Court, U. S.

Louis Marshall, president of the American Jewish Committee, and his associates, in opposing the removal of Pothier and Rosenbluth to Tacoma, set up an assertion that the United States did not have jurisdiction over the land on which the crime was committed. This was their plan to prevent the facts in this case from coming to light by preventing the trial from being held. They maintained that "no probable cause" had been shown for the removal of the two men to Tacoma, and brought *habeas corpus* proceedings to prevent their being taken there.

Stripped of its legal form, the decision of the Supreme Court in plain language is this: The Supreme Court decides that "probable cause" has been established and that the question of United States jurisdiction is to be decided only by the court at Tacoma. The Supreme Court says that it "has uniformly held that the hearing on *habeas corpus* is not in the nature of a writ of error, nor is it intended as a substitute for the functions of the trial court." In other words, the cherished privilege of *habeas corpus* cannot be abused by using it as a subterfuge to prevent men indicted for crime from going to trial. No more scathing arraignment of illegal tactics has ever been made by the Justices of the Supreme Court in thus pointing out the misuse by Louis Marshall and his associates of *habeas corpus*, and their ignorance of the "uniform" precedents established by the highest court in the land.

The irregularity lay in appealing from Judge Brown's decision. Under the law there is no appeal from a removal order issued by a Federal judge.

In one blow the decision of the Supreme Court demolishes the smoke-screen of deception which was built up about the Rosenbluth case, and which has already proved costly to many a reputation in judicial, political, financial and journalistic circles. The entire country is now aware of the identities of those who tried to obstruct the law. They have been not only defeated, but discredited. The decision is a rebuke to the Wall Street bankers who advanced their protection to one of the accused; it renders impotent the intrigue of the New York *World* in tampering with one of the Government witnesses by publishing an alleged retraction of his sworn confession; it discredits the instigators of the extensive publicity campaign conducted to create an "atmosphere" on behalf of one of the accused by periodicals such as the *Nation* and the *Literary Digest*, and by the *Institute for Public Service*, which actually circulated literature among school children, attacking the prosecuting arm of the United States Government; it is a reproach to those who expended such large sums of money in an attempt to defeat justice, and brings into relief the scandalous scenes that prevailed in Tacoma when intimidation was resorted to and prospective witnesses were plied with liquor to prevent them from being able to testify before the Federal grand jury.

A Lawful Course, Unhindered

THE Supreme Court ruling casts a peculiar light upon the activities of certain men identified with the Yale Forest School in attempting to discredit the action of the Federal court, in circulating a misleading booklet provided them by one of the accused and in trying to hush the exposure of the Rosenbluth case by issuing a pamphlet containing a personal attack upon the writer of these articles; it calls into question the "exoneration" pamphlet, built upon material concocted by attorneys for one of the accused, which was sent broadcast on the alleged authority of J. W. Selden, prosecuting attorney for Pierce County, Washington; it again calls attention to the sinister falsehood that young Major Cronkhite was buried in Arlington Cemetery, beneath a tomb on which were chiseled the letters "S. I. W." (self-inflicted wound), which was circulated by racial publications such as the *Jewish Tribune*, which placed the responsibility for this story upon the same man, Selden; it further brings intoprominence the iniquity of certain politicians in using their influence in Washington on behalf of one of the accused, even to the extent of exercising pressure upon members of the President's Cabinet.

Since the ruling of the Supreme Court was published on April 7, the developments have been prompt and decisive. On April 12, Pothier was taken into custody by United States Marshal Rodman, at Providence, Rhode Island, and committed to jail to await his removal to Tacoma. On the same day, Rosenbluth appeared before United States Commissioner Hitchcock in New York City, and announced his readiness to leave for Tacoma when required. It is evidence of the public fairness that in no part of the country has there been any exhibition of feeling against these two unfortunate men, whose misfortune it has been that they were deliberately entangled by misguided partisans into a racial and political intrigue. No one doubts that their trial will be a fair one, and if they are acquitted, there will be a feeling of relief generally that the procedure set up in such cases has taken its lawful course without hindrance. No one, as far as we are aware, has demanded the conviction of the accused men, but only their lawful trial. It is the trial that has been obstructed, and will now be held.

A Lull in Ireland's Affairs

From the *Round Table*, March

(London Liberal-Imperial Quarterly)

THERE seems today to be a kind of tacit understanding—pessimists call it a lull, optimists give it a more important place—but whatever it is, the Republicans have clearly no desire to break it. The passivity of the winning side is, I imagine, based upon the conviction that their opponents have reached a psychological turning-point. According to this opinion, the Irregulars are hesitating longingly on the threshold of the civilized life they have done so much to spoil, and the effect of a root-and-branch policy of extirpation, whatever else it might achieve, would obviously be to nip in the bud any tendency to repentance. Despair would indeed only lead to the perpetuation of lawlessness. As long, therefore, as the prodigals abstain from positive violence, the attitude of the Free State should also, on this theory, be a passive one, in order to encourage a return en masse to the fold. More than that: there is a feeling that, whatever their misdeeds, they are still Irishmen and brothers, and that the qualities of idealism and determination which some of them possess are needed by their country for her reconstruction.

Would they be put to such a use? They have appealed to physical force and failed. They have appealed to moral force and failed. Will they now see the error of their ways and return to constitutional methods? It seems to me that even in that event—and at the worst it is better than their present behavior—the temptation to follow a well-worn track would be almost irresistible. They would, surely, only enter Irish politics to obstruct, just as the old Irish party used to do at Westminster, their eyes fixed on a single goal.

Mr. Ford's Page

WHEN a friend lamented to Alexander Whyte the scarcity of great men these days, in the region of political leadership, Whyte replied, "They are a different race"—"I gathered that he meant a smaller," said the friend. Different and smaller, perhaps, though on the average higher, and lacking the once liberal sprinkling of tall statured men which make certain periods of our past so notable.

But to suppose that the political field exhausts the great opportunities for notable service, is simply to illustrate how firmly our minds are still held by the ideas of the past. It is not very long ago that only two fields opened to men of ambition and brilliant parts—the Church and the Law, the church with its side lines into literature and learning, the law with its main avenue into politics. In those days there were great clergymen and great statesmen. These two channels had a monopoly, as it were, of the brains of the times.

Doubtless a purpose can be traced in this. Indeed, it is only with difficulty that one can survey the past without happening upon what seems to be a distinct purpose in its development. For example: we now ride over the Mohawk Trail in our motor cars, and it means only a couple of hours of delightful scenery and outlook. But to reflect that these mountains were once the containing walls of the American nation, gives them a more than mere geologic or scenic meaning.

> *THE pioneers seem bigger than those who follow them, because they stand alone. They go out from a growing race, the first tendrils of conquest, but those who follow are of the same stock. In a multitude, however, the average is high enough to bring even the pioneer to the level of his fellow men. Pioneers in statecraft, science, invention, ethics, win reputation because out there in the new field they stand alone, and appear like giants. But as new fields are occupied by the crowds that swarm behind, distinction tends to vanish in a high average. Ordinary men are doing daily now what would have won them lasting fame in days when the average was lower. If sometimes we seem to live in a time of little men, it may be only because there are so many big men that greatness does not seem unusual.*

Within those mountain walls that American nation was contained until it had threshed out of its experience the vital principles of American life. It was cradled there between the mountain and the sea, a ferment of small factions, hearing multitudes of speeches, making public assemblies the chief features of its life, tasting and digesting or rejecting all the political philosophies then in the world, and developing as in a specialist's nursery a type of thinking, a type of outlook upon life which is distinct among the thoughts and attitudes of the world.

All this on the eastern side of the mountain wall. There was a great continent to conquer, but the conquering idea had first to be born and brought to maturity in that smaller compass of the original territory. Before those mountains were destined to be crossed in the westward migration of the people, the stamp of American mentality and energy and enterprise and principle was to be pressed deep into the new nation.

When that had been accomplished through the work of statesmen, schools, town-meetings, political upheavals and the creation and enlightenment of general opinion, then came a new wind blowing upon the nation. It began to feel narrowed and cramped, it longed for space, it felt the call of the continent. Paths found by adventurers through the mountains became the highways of a people on the march. The people of New England filtered through to Buffalo, thence to the Northwest and to the Pacific Coast. The Dutch stream from New York came up the Hudson, across Pennsylvania, and westward. The streams of migration can be traced in place names and the characteristics of the people even yet. Then in the great spaces of the central west and farther west the streams mingled.

But their glory was not in their numbers: their glory was in what they bore with them, the ideals of enterprise and independence and human justice and the fair chance, which had been born into their very blood during their apprentice sojourn beyond the mountains near the sea.

There was a purpose in that hill-kept infancy of the people. Concord and its school of thinkers who mingled iron with their thought and character with their conclusions, was not an accident; but we do not continue to reproduce Concords today. The New England poets bore their part which still runs strongly in the nation's mind, but we are not duplicating them today. Adams, Jefferson, Hamilton, Webster, Jackson, these all did their part, and upon their foundations our political structure still rests. But we have no Jeffersons and no Websters today.

It seems to be that, as the nation formed itself within the mountain-guarded area and then moved forth, so has the intellectual enterprise of the people moved out of the former fields in which it first exercised itself and gained its first sense of its own strength. It was necessary first that the political structure should be firmly based and strongly built in order that the life of the people might function freely. To this then principal task, the best minds of the country turned. It was pioneer work. The statesman was leader into a new region of collective living. His work was of the highest importance. He was not only an administrator of the public business, he was creator of the molds in which ever after the public business would flow.

With this achieved other interests claimed the pioneer type of mind. In the Colonies, medicine, for example, was little developed, and consisted of a few shrewd, common-sense observations, useful as far as they went, but not the stalwart ally of the public welfare which Medicine has become today. The field of manufacture opened, and with it the field of invention. Quickly followed the far-flung field of transportation. Then on the heels of these came the great era when it was first realized what tremendous natural resources awaited this people. Upon the growth of settlements came education which speedily developed its own specialists and its own science.

And thus, little by little, the two fields which once offered the stimulus of effort to the abler minds, were multiplied into many fields. And without necessarily disparaging either Politics or Religion, it is apparent today that so far as the world of professional activity goes, these have fallen into relatively equal positions with reference to many other activities although they were formerly the two chief professions. The opportunities for service have increased a thousandfold, and the avenues of activity have been multiplied almost beyond classification.

The two primary fields have, of course, influenced all the rest. Without the orderly life which is guaranteed by wise political organization there could have been no development of the arts and sciences, no secure outspreading of the people's hopes and efforts. And without the principles of morality and fairness and humanity which it has always been the special care of religion to inculcate, no human activity and development can remain sound. But, considered as regions of work, these two fields, once primary, are today two among many.

Perhaps the complaint that we lack great men in public life is the result of an unbalanced view. All forms of life are public, and surely there are great men in the various fields of life. Probably we are confusing greatness with unusualness. When there were only one or two great men in the nation they towered apart. But with hundreds of such men, greatness does not appear so unusual. One sometimes thinks, after carefully considering all the elements of the question, that in a given body (take Congress for example) the common average represents really a higher degree of character and ability than was represented in some of the great men whose greatness towered above the multitude in early days.

With that true of the rank-and-file, great men (in the older sense) are not so necessary, and they are not so easy to produce. The great man of today must necessarily be greater than the greatest men of the past. The average has greatly risen, because the opportunity for development and action is widened and diversified beyond measure.

A volume of 452 pages, durably bound, containing 98 of these articles, under the title of "Ford Ideals," will be sent postpaid for $1.00.

The Rule of the Home

A BROOKLYN judge asserts that more than eighty per cent of our criminals are under twenty-five. Another New York jurist observes that the average hardened criminal is about seventeen, and that the age at which the largest numbers of prisoners are committed to jails and reformatories is nineteen. This implies a youth situation of alarming proportions and implications.

How can this frightful wastage of young life be accounted for? Those nearest to the facts tell us that it is not the fruitage of a crime wave that inevitably follows in the wake of war. The causes go much deeper. In the final analysis the principal indictment falls upon one only institution and that institution is the average American home.

The tap root of the situation is contempt for rightly constituted authority. A generation ago the parents governed the family. Today the tables are turned and the family policy is largely dictated by the children. Consequently, before either the school or the church can assume any guardianship, the seeds of potential disorder have been sown. Nothing is plainer than that moral education, like charity, must begin at home.

The child who has not learned a wholesome respect for home-law will have nothing but disdain for school-law. The youth who has not been disciplined to regard either will leave school around fourteen and go out to defy all law. And when he falls into the stern hands of the guardians of the law he will have his parents to thank most of all.

The remedy is not better laws or better schools or better churches. It is better homes and better parents.

The Women—Bless Them!

THE women of America have recently given evidence that they are penetrating the specious efforts which have been made to work under cover of their organizations for ends not clearly defined. The modern movement among women came at a time when propagandism of the secret service type was highly developed among those groups most inimical to the American idea. For this reason it was not surprising that the initial experiences of the movement were of varied kinds. The highest kind of compliment was paid to the women by the propagandists in the tacit admission that American women could not be organized or moved except on a high plane of idealism. The precious elements of womanhood—its strong desire for sweetness and light, its powerful sympathy for the oppressed, its natural antagonism to duplicity and brutality—were all counted upon by those who planned to "use" the women's organizations. American women did not know that while the ostensible objects of their associations were being advocated, other ulterior objects were being fostered. Nor did they know that in some cases methods of political coercion were being used that no American woman would countenance.

But there never was any real danger to the women's movements—certainly no real danger *in* it—but there was a condition of misinformation in some quarters that had to be dispelled. Happily it has been dispelled. The majority of the leaders of the women's organizations, especially those leaders who lived among the people, and not in the fetid atmosphere of Washington, have always been clear-seeing, and of late have developed an instinct by which they are becoming more and more able to detect the approach of subversive objects. There has been a widening of vision, so that now the published altruistic purposes of certain groups are not allowed to obscure the harmfulness of the methods by which the altruism was to become effective. American wives and mothers, as distinct from the professional type of "woman leader," have become aware that they have attained a sufficient importance to become desired as the vehicles of ideas that ultimately are not for the general good, and hence they are on guard as never before.

All this is clear gain and insures the continuance and usefulness of the movement as a whole. The un-American fringe will fall away. Observers have seen nothing more refreshing and hopeful than the manner in which women, especially in their local clubs, have cleaned house and taken stock of the more general trends of their programs. The great power of American womanhood is now in less danger than it ever has been of being misled by false phrases. And that happy condition has been recently attained.

Once Out of Debt

IT WAS nearly a century ago, in December, 1834, that Secretary of the Treasury Taney, in his annual report to Congress, announced that the entire national debt would be paid or provided for during the ensuing year. "Thus the United States will present that happy and probably, in modern times, unprecedented spectacle of a people substantially free from the smallest portion of debt," to quote from the report.

Secretary Taney's predecessor, Secretary McLane, had predicted the total extinguishment of the national debt three years before, and it is evident that the officials of that day had no confidence in the theory, attributed to Hamilton but probably never advanced as a general truth, that "a public debt is a public blessing," for the final wiping out of the last bond occurred but seventeen years after the close of the War of 1812, in which much of the debt was created.

Had later financial administration been as thrifty, Uncle Sam might long ago have paid the Civil War debt, which still drags along to the enrichment of the bondholders.

A Democratic Possibility

WHO will the Democratic Presidential candidate be? Distinctly less certain is the answer given to that question than to the question of the Republican candidate. It is generally conceded that Mr. McAdoo may go into the convention with forty-five or fifty per cent of the delegates instructed for him. But it is likewise conceded that Mr. McAdoo has failed to capture the imagination either of his party or the country. Indeed, serious defections have occurred in quarters where McAdoo support might have been reasonably expected. The Democratic field is still an open one.

The casual mention of Josephus Daniels, as a possible candidate, has sparked more public and partisan interest than the political press reflects. Mr. Daniels, it is true, promptly announced that he was not a candidate, and his state, North Carolina, did not name any delegates for him. Nevertheless his name came with the effect of light and hope to thousands of Democrats. He represents qualities which are too much lacking in present politics. He stands for some of the best achievements in public life. In fact, the naming of Mr. Daniels as a possibility threw an element into the situation which may yet have important results.

Every Presidential convention goes through three stages. First there is the complimentary introduction of various candidates, "favorite sons," "available timber," "receptive party wheel-horses," and all the rest. That over, the convention settles down into its second stage, the fight between candidates who really count. The impolitic thing about strong convention candidacies is that they evoke as strong opposition. When a convention reaches a deadlock through the determination and strength of two candidates, it begins to slip into its third stage, the search for compromise candidates, for "the dark horse" whose modesty has created no enmity and whose past record renders him acceptable to all factions.

It may be that in the third stage of the Democratic national convention the name of a man like Josephus Daniels will come with unifying power and carry off the nomination from the stronger contenders. Speaking generally, the Democrats could conceivably do much worse than name Mr. Daniels.

If it shall turn out that the indictment of Senator Wheeler is without warrant—a "frame-up"—the result will be disastrous to those who are responsible for it. At this writing it is only too obvious that but for his activity in the investigations, Senator Wheeler would never have been subjected to this attack on his reputation. The method and the motive of the attack are of the same low moral order and will blacken any faction or party that attempts to justify it. Politics, as the game is now being played in the sight of the American people, is a sad exhibition of petty-mindedness.

Few Words

PRESIDENT COOLIDGE has won the reputation of being a man of few words. He appears to listen much and say little. This was not dispelled by his recent address which required forty-three minutes to deliver. What he really had to say in that address, he said in a few words. The rest was—perhaps not exactly padding, but verbal detours which served to keep the Presidential presence before its hosts for a polite interval of time.

Speaking of the recent scandalous practices disclosed by the Congressional investigations, the President said: "There is an exceedingly healthy disposition to uproot it altogether and administer punishment wherever competent evidence of guilt can be produced. That I am doing and propose to continue."

Concerning taxation and cost of government, the President said: "The success of Government does not lie in wringing all the revenue it can from the people, but in making their burden as light and fairly distributed as possible, consistent with the proper maintenance of the necessary public functions."

Nowhere did the President seem to feel more the sense of message than in his discussion of our foreign relations. In this he was frankness itself, uttering some aspects of truth which diplomats commonly gloss over, and steering completely clear of all sorts of bombast. He does not abate any just credit due to America, he does not make claims that go beyond the bare facts.

Of American participation in the war: "We took our part in the war at length, in the defense of free institutions. We believe, while acknowledging that we were only one of the contributing elements, that our participation was a decisive factor . . . .Our action at this time was distinctly a world service."

Of American influence in making the treaty: "There can be little doubt that our presence at the treaty table softened the terms and diminished the exactions of the victorious nations, where joint covenants of defensive alliance were in part substituted for the usual territorial transfers."

Of the United States' attitude toward the League of Nations: "Our country refused to adhere to the League of Nations with a decisive rejection which I regard as final."

Of the feeling toward the United States by the other powers: "It is undoubtedly too much to suppose that we hold very much of the affectionate regard of other nations. At the same time we do hold their respect."

As to what the other nations may rely on concerning the United States: "If there is disappointment in some directions that we do not enter alliances with them, *it is more than overbalanced by the knowledge that there is no danger that we shall enter alliances against them.* It must be known to every people that we are seeking no acquisition of territory, and maintaining no military establishment with unfriendly and hostile intent."

As to Peace in general: "I do not claim to be able to announce any formula that will guarantee the peace of the world . . . . On what nations are at home depends what they will be abroad. If the spirit of freedom rules in their domestic affairs, it will rule in their foreign affairs . . . . We increase the desire for peace everywhere by being peaceful . . . . We maintain a military force for our defense, but our offensive lies in the justice of our cause . . . . We believe in treaties and covenants and international law as a permanent record for a reliable determination of action. All these are evidences of a right intention. But something more than these is required, to maintain the peace of the world. In its final determination, it must come from the heart of the people. Unless it abide there we cannot build for it any artificial lodging place. If the will of the world be evil, there is no artifice by which we can protect the nations from evil results."

One other statement showed President Coolidge to be democratic in the strict American sense. He believes in the freedom of the people, wholly: "We need a faith that is broad enough to let the people make their own mistakes. Let them come unto knowledge and understanding by their own experience."

That is the gist of Mr. Coolidge's mind as he shares it with the people at this time. While not the man of letters Lincoln was, nor a master of Wilsonian phrase, the President can say the thing simply and clearly, and having said it, let it work.

However, words at the best lose their savor unless enshrined in supporting actions. In the above speech the only reference that concerns the Executive alone is that which refers to prosecution of criminal officials. The Big Stick, if there is one in this Administration, has been most strongly shown in efforts to thwart the Mellon investigation. To be a very convincing Big Stick it must be shown in positive action also.

New Rentenmark Shows Up Real Poverty

Germany Welcomes Breathing Spell Offered by New Money; Government Regulation Curbs Activity of Shady Profiteers

By HARBOR ALLEN

WHILE the new Rentenmark ($1=4.2) has given Germany a breathing spell and is gradually swinging living conditions back to a halfway bearable state in the Reich, it has also torn off the mask of "easy-money" prosperity and shown the German people for the first time how hideously poor and exhausted they have become.

Still the average German is not complaining. Poor as he is, he can still feel much gratitude for the change from the deadly days of last year, and his daily prayer is that the new currency will not fall prey to the fierce infant mortality that carried off in quick succession Germany's output of thousand, million, milliard, and billion mark notes.

Best of all, food has suddenly and miraculously appeared in plenty on the market. In January people still had to fight for a loaf of bread and a few pounds of potatoes: now you can get all the bread and potatoes you want, and oranges, apples, dates and figs to boot. Hawkers crowd the curbs of Munich and Berlin with carts piled high with Italian fruits and delicacies, and groceries have loaded up their windows again—as they weren't loaded up since before the war—with Dutch cheeses, Portuguese fish, American meats and lards, and German butter and eggs.

A few months ago you got nothing but frowns and grunts when you went into a store to buy. Shopkeepers were compelled by law to remain open so many hours a day and to sell their wares; but secretly, they tried in every way to keep their goods rather than trade it off for your worthless paper bills. Now shopkeepers smile at you as they haven't since 1914. They urge you to buy more; they show you their goods with bows and flourishes of courtesy; they accompany you to the door and send you off with a gracious: "Gruess Gott die Herrschaften. Beehren Sie uns wieder." ("God be with you, noble sir. Do honor us again.")

The reason for this is obvious. Two months ago everybody had lots of money and was trying to pass it off to the next man as fast as he could. Now nobody has any money and is hanging on to every pfennig as long as he can. As usual, wages are lagging behind the cost of living like a man with two broken legs.

Prices for food articles have sunk to American levels or even a trifle lower. This is the result of gentle prodding on the part of the government, which has established price-testing bureaus in every city to compel the business man to come to his senses and be satisfied with a civilized profit.

The price-testing bureau in Munich, for instance, soon discovered that almost all branches of business, taking advantage of the chaos in figures and money, were charging prices one hundred and two hundred per cent above the cost of production. The results of the bureau were published and the stores were compelled willy-nilly to abide by its decision.

Consequently, overnight sausage dropped from $1.25 to twenty-five and fifty cents a pound; meat from eighty cents and one dollar to fifteen and twenty-five cents; butter from $1.50 to forty-five cents; bread from twenty cents a loaf to seven cents; and eggs from ten and fifteen cents each to five cents.

Hardest hit by the "recovery" of Germany have been the farmers, who only two months ago were the virtual rulers of the republic. Today they are crushed under the enormous new 1924 taxes and are hard pressed for money. Money is absolutely scarce; banks have none to lend and the state is neither in a financial nor a temperamental mood for extending a hand to the farmer. The farmer is therefore compelled to open his granaries and throw his products on the market for what he can get, usually at prices consistently below the par of farm products in 1914.

These comestibles are scooped up by the army of Germany's shady middlemen and speculators, who, in the chaos of the last years, have become the most efficient and accomplished gougers and profiteers in the world. The tactics of these men would put the exactions of Chinese bandits to shame. All the price-testing bureaus have been able to do with them is to put a slight dent here and there in their get-rich-quick ambitions.

The camouflaged field kitchens of the old army have been pressed into service by "Not un Brot" ("Need and Bread") a vast organization which is feeding the hungry unemployed and the children on Germany's bleak streets during the terrible "recovery crisis."

The worker, like the farmer, is being crushed—only he between the government and big industry. The state has cut the wages of its postmen, teachers, telephone, telegraph, railroad, and power plant employes to exactly one-half their 1914 salaries. This means that a mail carrier in Germany earns fifteen dollars a month, a high school teacher forty dollars, a high government official eighty dollars, a representative to the Reichstag $120, and the chancellor of the entire German Reich $300!

With the same pen that slashed the worker's salary in half, the government raised the cost of freight, light, gas, and coal to prices higher than those in America and probably higher than those anywhere else in the world. How a man with a family can live in one of Germany's large cities on fifteen or even forty dollars a month is a mystery I cannot solve. When the mail carriers held a huge protest meeting in Leipzig recently, the post office replied that they should be glad they had jobs at all, since in the vast economizing campaign to be started this spring, more than one-fourth of them could expect to be turned jobless into the streets.

In the autumn everybody had plenty of money, even if it was no good, but nobody could get food. Here is a typical line clamoring for food. Now there is plenty of food but nobody has any money.

Taking its cue from the state, big industry is meting out the same bitter pills to factory workers. Spreading unemployment has paralyzed the trade unions and thrown the worker limp at the mercy of his employer. There are already 3,000,000 unemployed in the Reich, and the number is constantly increasing.

Metal workers in North Germany are glad to work ten hours a day for forty pfennig an hour, less than ten cents. Masons in Munich are working half time for twelve marks a week, less than $3. Women of refinement are scrubbing offices for ten marks, $2.50, to help keep their families from starving. A few months ago you could not get a servant girl for love nor money. All the young women were filing into the banks which were springing up by the score on every square. Now the banks are deserted and are closing down one after the other, and you can hire all the maids and cooks you want at three and four dollars a month. A great many of them are seeking jobs in America.

But while people are getting such pay, shoes cost seven dollars a pair, a shirt five dollars, a suit forty; and to heat and light a single room at all comfortably in February cost twelve to fifteen dollars!

It is no wonder, then, that one-fourth the entire city of Munich is being fed from soup kitchens supported by money collected in America and other parts of the world. Whole restaurants have been taken over by a national emergency organization called *"Not und Brot"* (Need and Bread) and have been converted into public halls where poor people, with cards issued from headquarters, line up daily by the thousands to get a piece of bread and a warm bowl of soup. The camouflaged rolling field kitchens of the old army have been pressed into service, and every day at noon the soldiers dish out food to the half-starved unemployed on the streets.

Meanwhile, Germany's "heavy industrialists," already responsible for a large share of the misery of their compatriots, are taking advantage of the situation and toying with dynamite. "We've got the workingman where we want him now," declared the secretary of the Bavarian Manufacturers Protective Association recently. "Wait until he has starved for a while. Then he will be willing to work twelve hours a day for nothing."

This policy will cause more than a little trouble in Germany sooner or later. Just at present the German laborer is willing to work for almost nothing to keep alive, but he has not forgotten the improvement in his standard of living immediately after the war. He harbors a grudge against his employer, which, once he gets on his feet again, is going to make some chips fly.

Swindled out of everything he possessed, the small property owners and stock holders—*Kleinrentner,* they are called—are worse off than the worker. Generally they are too old to work, and are totally dependent upon the charity of relatives or children.

While the mark was dropping, these people were deceived into believing they still had valuable possessions. Bondholders counted their riches as they read in the Berlin bourse that their papers were quoted first at a hundred thousand marks, then a million, a milliard and finally ten billion.

Ten billion to these old-timers, accustomed to the sanctity of the par mark, sounded like a vast amount of money. When the stabilization of the mark came, however, they soon found that they were stripped to the skin. The state announced one bright morning that henceforth a billion paper marks were worth exactly one Rentenmark, about twenty-four cents, and these *Kleinrentner* then had to strike off twelve ciphers.

At the same time the government began to pay back its war bonds, refunding one paper mark in 1924 for every goldmark paid in 1915. An acquaintance of mine who sank his entire fortune of 850,000 goldmarks ($200,000) into government war bonds, received the other day, together with interest, about one million paper marks. This is now worth 1/400,000 of a cent. An American can understand this process—and what would happen to an enormous class of people in the United States—if he imagined that the American Government began to pay back its Liberty bonds at the rate of one cent for every forty-two milliard dollars invested in 1918. This is precisely what the German Government is now doing.

People dependent upon the income of real estate are also left destitute by the fantastically small rents which the government compels them to accept.

The cost of sweeping the chimneys in February in Berlin was more than the total income of rents. Consequently, houses are simply going to ruin. Tenants are too poor to pay. Rents are now gradually rising and will probably reach 1914 levels—which compared to American rents are cheap enough—by the end of this year.

Meanwhile, a small class of shady profiteers are living on the fat of the land, wearing furs and silks, scurrying about in limousines, and keeping the demimonde cabarets and wine-restaurants jangling with jazz into early in the morning.

That these conditions cannot long continue is obvious. Germans are not yet aware of the staggering exhaustion and shabbiness of their cities, their homes, their resources, their lives. They are too happy for the breathing spell afforded by the stability of the mark to think about their inconveniences. At least, they no longer have to hurry down to the bank every morning, buy up everything they see, try to get rid of their money as if it burned the hand.

Lately there have been rumors that the mark is fluctuating again in the "Ausland." The papers, gagged by press dictatorship, are blaming it on foreign speculators. But those who know say that the government, having exhausted its credit and its patience waiting for an American or any other kind of loan, is secretly inflating the Rentenmark. If, after this short taste of civilized and human financial conditions, the German wakes up some morning to find that it has all been an illusion, the reaction will be disastrous.

The Hottest Spot in the United States

Harvesting her own—women are largely concerned with the American date industry.

"A Hellish, Hopeless Desert"—Second Death Valley Becomes a Date Garden

By MARY E. WALTER

THE hottest spot in the United States is at the same time the most unique. Hottest and driest agriculturally, it is part of the desert of the great Southwest, yet the harvesting and the marketing of this year's crop from the date palm gardens that convert this arid region into a huge oasis have brought to commercial security a new American industry. They have likewise marked another step toward the adjustment of one of our frontier sections and point to its rivalry of the Old World in at least two particulars.

Round 1370 B. C., when the great Hall of Karnak was built, the date industry flourished in the Nile Valley. Dates were doubtless known to the Queen of Sheba when she made her memorable visit to King Solomon.

Yet in little more than twenty years the date industry of America has gone far in some respects toward outdoing that of the Orient; this because it is the offspring of intelligence, imagination and vision. The farmers who are "bucking the desert" are largely college-bred men, possessed of the rare spirit that typifies western pioneers—they are New Era farmers. Moreover they are, most significant of all, helping to demonstrate what is possible to the growth of an infant agricultural industry when it is taken in hand from the start and fostered through all its adolescence by the United States Government.

A generation ago the grandfather of the writer crossed a part of this desert with a band of sheep, leaving many of them dead on the tree-less, water-less, sun-baked waste, and sent back word that characterizes the "old-time" farmer even today, "a hellish, hopeless desert."

Desert? Of all the area where date raising is possible, not a thousandth part is now under cultivation, yet to that old man this bit would be a marvelous mirage, a huge oasis, spread with acre after acre of fruiting date palm gardens—they are "gardens," not orchards—where this year's harvest has crowded to capacity the packing house accommodation and where growers begin to look east for their market.

Climatological data of the United States Weather Bureau show that Coachella Valley, the principal date area, which is geographically the upper extension of Imperial Valley, almost rivals Death Valley in conditions of temperature and dryness.

Still more astonishing to that old sheep-owning pioneer would be the indication of present development and interest—that here is the future wintering place of Southern California, with an ideal winter climate, dry, warm and balmy, its appeal strengthened by contrast with corresponding coast points, so liable to be cold, raw and damp in winter.

It was not till 1900, after initial effort, that the United States Department of Agriculture made its first large importation of date palms that lived, when Dr. Walter T. Swingle, of the office of crop physiology and breeding investigations, Bureau of Plant Industry, United States Department of Agriculture, had learned, through experience in Old World date regions, how to pack young palms for shipment and to ship them in bulk. In all a dozen expeditions to the Old World were sent by the government, resulting in an excellent collection of all good varieties from the best date regions of the Orient, which were tried out in experiment stations established and still maintained in Arizona and at Mecca and Indio, in Coachella Valley, California.

Roughly, 200 varieties were imported; some five per cent of these have proved satisfactory for American culture and less than two per cent adapted to commercial development here.

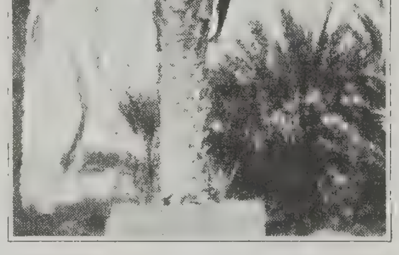
Later, before the World War, the government imported 20,000 young palms of the Deglet Noor variety, which, besides costing the co-operative growers $50,000, cost the government $50,000 more to disinfect and care for till they were ready to be planted in orchard form. After the Armistice came an importation of 10,000 more of two varieties, which two corporations contracted with the government to keep in co-operative quarantine nurseries and later distribute offshoots at a minimum cost. A number of Khadrawi palms, a Persian variety, were imported privately.

Why should the government spend all this money? Because, as pointed out by Dr. Swingle, the date cannot be grafted like other trees, such as the grapefruit, with which pedigreed buds can be set into seedling stalks. Date palms, to come true to type, must be propagated from offshoots or suckers, which remain on the parent stem till three years old, then are chiseled away, roots and all, if they have rooted. The farmer who plants dates from seed must wait some four years for fruiting to determine the value of the product. If this is inferior, he must dig up the palm.

Seedling palms all bear differently, though a few good varieties have been developed and the government stations are now continuing work on new varieties of American origination, with promising results.

To be sure, it costs approximately $250 to bring an acre of seedlings to bearing, against $2,500 for an acre of the best pedigreed offshoots. Moreover, seedlings, unlike imported dates, are free of pests and need no expensive disinfection, isolation and spray. But the difference has been demonstrated by the Federal Department of Agriculture and some of the growers, with the result that the state real estate commissioner, Edwin T. Keiser, refuses to approve any real estate scheme involving the sale of dates unless the offshoots are of proved performance. Any one so selling must give satisfactory pedigree of stock or must state in advance exactly what stock is being sold. This is to prevent fraud and that the public may buy with open eyes. At all times the commissioner is active in warning the public against buying dates unless of performance stock.*

So is the farmer assured a marketable crop, and ultimately the standardization of quality and pack purely American.



Leaf bases are used for steps on the older palms in pollinating and harvesting.

Thus the United States as the fostering mother behind the industry has made for prevention of disastrous mistakes.

Co-operating with the work of the government, date growers have, through failure and discouragement, worked more or less without precedent in matters of cultivation, irrigation, fertilization, pollination, which must be done by hand; treatment of the fruiting stalks, culling, maturation and processing of the fruit, as well as in cleaning, packing, standardizing, grading and marketing. But in these very things lies the superiority of American dates, as once suggested by Professor Silas Mason, of the United States Department of Agriculture, in his reply to the former king of Egypt who asked Professor Mason, when he was investigating dates abroad, why Egypt did not have as good dates as any in the world.

By carefully worked out methods, maturation or final sugar development of our dates takes place off the tree before flies and dirt reach them, unlike the product of the Old World, some of which, in packing to keep out bugs, is crushed into stickiness by a board placed on top and tramped down. In the average pack of such product the consumer is supposed to get his required peck of dirt. American dates are disinfected before shipping to prevent hatching of possible eggs. This is done by fumigation or pasteurization. Moreover, by specially devised cleaning methods and utmost sanitation in the packing houses, where women are largely employed, domestic dates have come to live up to their slogan, "from the box to the banquet table."

Again in rooting offshoots have the science and ingenuity of American methods resulted in a superior product. According to those acquainted with date cultivation abroad, the Arabs raise only about two-thirds of their offshoots, or less, where our growers have worked out methods till now, by rooting all offshoots on the palm or in specially tended outdoor nurseries, they save one hundred per cent and get one hundred per cent to grow the first year. Thus the orchard increase can be more rapid than in the Old World, because numerical increase of offshoots now works. For example, the Saidy variety bears some twenty-five offshoots. These at the right age each start another young family of twenty-five. Other varieties bear more or less.

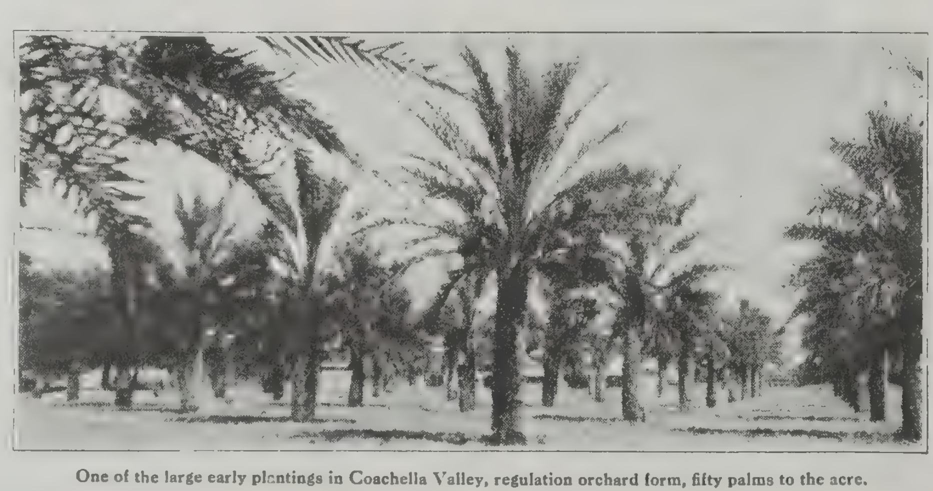
Five years after the three-year-old female offshoots have been set in orchard form, they are calculated to produce two tons of fruit to the acre—fifty palms to the acre, one of which is male for pollination. This average increases with age but is held from over-production by careful pruning of fruiting stalks.

The average number of palms to the acre in one of the most thickly planted date regions of Mesopotamia is 130, according to a date census taken there by the British Government. But this same census shows for the year 1919 an average of forty-four pounds of dates to a palm, less than half the lowest estimated average of our palms.

Figures on paper—booster talk too often imputed to Westerners—justify the statement that an acre of dates is the most paying agricultural venture in America. A palm of good variety, say the enthusiastic, given proper attention, yields at full maturity 125 to 200 pounds with a maximum of number ones. Fifty palms should produce 7,000 to 10,000 pounds. At as low as twenty cents the pound the net is not small and many dates bring vastly more than that. Besides, ten to twenty-five offshoots to each palm are worth while, either for sale or expansion of acreage. Some date champions estimate that the best grade of dates can be made to pay $2,000 a year an acre, or ten per cent on $20,000.

That palms continue fruiting for a century at least confirms the statement that an acre of full-bearing dates should be worth $8,000. Moreover, even the most pessimistic agree that dates are not set up for show, as a real estate lure, because the government is back of the planting.

But—



One of the large early plantings in Coachella Valley, regulation orchard form, fifty palms to the acre.

Nobody concerned denies that date raising is not a poor man's proposition. Neither, according to Dr. Swingle, is it a rich man's proposition.

The cost of establishing a profit-yielding date acreage is stupendous in comparison with other California crops. While twenty acres in full bearing should carry, at the lowest figure, 200,000 pounds, consider the cost of getting it to that point.

Offshoots cost from fifteen to twenty-five dollars apiece, the latter fully rooted, so saving time and money. A dollar each is estimated for setting. To be sure, later on, from the two co-operative quarantine nurseries under government supervision, standard offshoots will be sold as per contract at $3.50 and $7.50, according to variety.

(*Concluded on page 13*)

*Practically Mr. Keiser's words personally to me.

The Revolver Traffic—Its Contribution to Lawlessness

By E. L. M'COLGIN

"WHAT'S the matter with you mail carriers anyway? Why didn't you deliver these revolvers yesterday, when they were due to arrive? The gang was all here then and I could have turned the guns over to them; now I will have to get them together again."

The proprietor of a near-beer saloon, a rendezvous of bootleggers, hijackers and other birds of prey, was bawling out a United States mail carrier, if you please! Uncle Sam was not sufficiently energetic in performing his share of the circumvention of the state law forbidding the purchase of pistols unless a permit is issued by the chief of police or the sheriff.

If you live in a community that forbids you to purchase weapons without first obtaining a permit, the postal laws enable you to buy your gun without the state and have it delivered by mail. The post office gladly handles the business on a C. O. D. basis, remitting the collection of the purchase price to the seller and pocketing its fee as honest earnings.

There are a number of houses, many of them foreign owned and operated, that specialize in this sale of murder by mail. Butler Brothers, a highly reputable mail order concern, recently announced that it would no longer accept business of this sort. Years ago the conscience of the nation caused the carriage of booze to be outlawed from the mails to prevent local laws being evaded, as is now being done in the case of revolvers and pistols.

However, the peevish outburst of the proprietor of the nest of lawbreakers quoted above proved to be the straw that broke the camel's back in that city. The postmaster and police department got together, anticipated Congressional action, and now mail carriers do not peddle automatics to the tenderloin.

The person to whom a gun is sent by mail nowadays, in this city at least, receives a card stating delivery can be obtained only by calling in person at the post office. The police department has a detective stationed in the post office watching for the appearance of the sneaking mail order buyers. When delivery is made the officer follows the receiver out of the post office—that is, off Federal property—and takes him into custody for unlawful possession of the weapon. It has worked out beautifully and shows how a self-respecting postmaster can prevent being made a cat's-paw for the underworld.

The record of the first fifteen weeks of the new order of things in this one post office indicates the proportions of this use of the mails by gunmen and how it was reduced:

One thousand and seventy-one parcels of firearms were received in that period. Four hundred and sixty-six of them were delivered to customers and the lurking policemen confiscated three hundred and twenty-five of them; the remaining one hundred and forty-one delivered arms evidently got out while the officer was following another customer.

The most significant fact is that six hundred and five of these shipments remained on hand unclaimed. The crooks soon learned that post office has ceased to be their arsenal. Some of the firms engaged in consigning these arms via the post office complained to Washington but got no relief. While legal the pistol traffic is too raw to be defended by the department.

Here is a sample of the kind of people who were obtaining arms through the post office: Francisco Cona was sentenced in July, 1913, for killing a policeman and paroled in the spring of 1923. In September the detective at the post office found Cona had just received a revolver and arrested him.

Cona offered a bribe to the officer and later made a break for liberty, biting his captor's hand in the scuffle.

The strict pistol laws of some states are nullified by indifferent neighbors. New York gunmen purchased their artillery in Jersey City and Michigan gangsters can run over to Toledo, and no troublesome questions asked by the Ohio tradesmen.

The habit of toting a gun has resulted in this country being afflicted with more armed ruffians than any other unless it be those Asiatic regions that openly recognize banditry as part of the scheme of things.

The International Association of Chiefs of Police represents the first line of defense against the enemies of law and order. These professional foes of the gun toters demand legislative co-operation in ending the present virtually unrestricted traffic in weapons that can be easily concealed.

The American Bar Association is on record in favor of suppressing the manufacture and sale of pistols. Perhaps this attitude of the lawyers is in response to the energetic attitude of Chief City Magistrate William McAdoo, of New York City, one of the most positive judges in the country, a man of action and lofty public spirit. Judge McAdoo has to deal with the worst zone of lawbreaking by armed criminals in the country and knows whereof he speaks.

Senator Copeland, of New York, has introduced a bill at Washington, Senate No. 1960, that embodies Judge McAdoo's views about ending the traffic in pistols. It is very drastic, but Judge McAdoo declares the situation requires such treatment and without further delay.

The so-called Roach Bill, H. R. 4142, has also been submitted to Congress. It, too, would practically end the transportation, sale, import and export of pistols except for the use of officers and a negligible number of licensed persons.

Then there is the Capper Bill for state regulation of traffic. It is sponsored by the United States Revolvers Association, representing the civilians and military who use pistols for target and kindred purposes. The Capper Bill does not outlaw pistols from the mails and express; it seeks to impose a uniform licensing of the traffic and to penalize persons caught violating laws with guns upon them.

The Postmaster-General says he approves of any proposition having for its purpose the prevention of the indiscriminate shipment of weapons through the mail which cannot be prevented under existing postal laws.

However, these well-meant laws overlook the potentialities of smuggling arms in from abroad in the same way that liquor is now obtained by importing bootleggers. The chiefs of police, experienced in dealing with human nature, have in mind that too drastic American laws would drive the traffic under cover and put it on a plane with bootlegging and the narcotic drug traffic.

The police advocate first limiting the transportation of arms by mail or common carrier except where local pistol laws are complied with by the receivers. The police would then rely upon public sentiment requiring the national government to take further broad and effective treatment that would stop the foreign traffic as well as the improper distribution of our domestic manufactures.

The weakness of all pistol laws, however, is that decent citizens obey them, and thugs do not; thus those needing defense are unarmed, while the criminal classes are walking arsenals. What is required is some kind of actual prevention which will make possession impossible except under satisfactory guaranties.

The crooks are not arming themselves with fine American revolvers, the standards of the world. German and Belgian concerns and German-owned factories in Spain are dumping cheap guns, often without proof marks attesting their safety, upon the American market at one-third and one-fourth of the prices of reliable American makes.

England has dealt with the revolver problem in accordance with its traditions as to law and order.

In all London there are but about one hundred civilians authorized to own guns.

During one year England had twenty-six murders. Thirteen of the criminals committed suicide on the spot because they knew what would happen to them; two were found insane, and that means the real thing in England, and the remaining eleven were either hanged or given long terms of imprisonment.

The English police do not go armed unless they are assigned to apprehend criminals presumed to be armed. Lawbreakers found armed are given sentences that simply appall one, but the result is that even burglars usually ply their trade unarmed.

There is much need for ending the popular delusion about the protection afforded gun carriers. Secret service men frequently arrest criminals without having a gun in their pocket. While the police in this country cannot give up the use of arms, they place less trust in them than laymen imagine.

As for the householder who arms his castle, the police agree that he would be much better advised if he would place electric lights over rear entrances and dark side passages. Prowlers will not operate under a light and this protection is cheap and useful in other ways. It is also helpful to have special switches in the bedroom that will flood different parts of the house with light. This will cause intruders to flee at once.

Revolvers in private houses cause more tragedies than they avert crimes. Domestic quarrels frequently end in one person thinking of the gun in the house and using it with fatal effect. Guns fall to the floor and explode with resulting injury and the gun that is supposedly empty is always going off and wounding or killing one. One is continually reading of children getting hold of these arms with terrible results.

Never put the gun in your pocket. It is useless there and makes you liable to arrest.

Surely the United States can do as well as Canada, England, Ireland, Holland, Denmark, Norway and Sweden and Japan in eliminating the armed gangsters. The present situation is giving us a bad name throughout the world; we are properly regarded as having the most lawless and murderous elements of any country that terms itself highly civilized.

The Wife Put Her Foot Down and Husband's Gastric Distress Vanished—By G. W. BARRINGTON

MY EXPERIENCE exactly reverses that of the ubiquitous signer of patent medicine testimonials. In youth he was wan and sickly, but after he had crossed the crest of the hill, he took two small bottles of Gogetem's Vitalizer as per directions plainly printed on the label ($1.25 postpaid) and today is almost afraid to consume the three bottles still on hand. His fear is that if he should grow still stronger and high-spirited he will rollick about, breaking fragile things, until the precious Vitalizer will prove a bad investment after all.

By way of contrast, I was a sturdy youngster fitted by nature with an inner organism which ticked right along no matter what strain was imposed. I ate, slept, worked and played as fancy dictated or fortune decreed. Finally fortune decreed that I should work and eat more steadily than I should play and sleep, and the little dinguses concealed in my torso filed more demurers than Governor Walton's attorneys did in his famous impeachment trial.

Doctor Number One looked long and earnestly at my tongue, took my temperature, timed my pulse, asked numerous questions, and gravely informed me that I had stomach trouble.

It wasn't such a shock as you might think. I had suspected it for some time.

Doctor Number Two looked long and earnestly at my tongue, took my temperature, timed my pulse, asked numerous questions, and called it gastritis, which is another name for the same thing.

Doctors Three to Seventeen, inclusive, looked long and earnestly at my tongue, took my temperature, timed my pulse, asked numerous questions and corroborated.

Being of a placid, amiable disposition, I never disputed one of them, though, as medical science advanced, I learned that the raw egg which was prescribed by a medico of the late eighties should have been boiled twenty minutes, and that fat meat is more easily digested than lean, no matter what the pioneer explorers of my anatomy may have said to the contrary. Doubt intruded naturally, but I never rebelled. It is easy to do independent thinking when at ease, but when one of those old-time physicians looked at you over his glasses, stroked his beard reflectively, and announced that you had stomach trouble, the correctness of his diagnosis so impressed you that anything else he said commanded instant and unrestricted credence.

For a decade and a half my stomach was like a street car line or an electricity plant; it was privately owned, but publicly conducted.

I Fletcherized, guzzled capacious tumblers of hot water, went breakfastless, did calesthenics, eschewed meat instead of chewing it, altered the solidity of my eggs as the fashions changed, gurglingly absorbed yeast, shifted at times to raw vegetables, and for a brief season listened to the gratuitous and gratis advice of a cult which advocated an exclusive diet of fruits and nuts—suggestive word.

Throughout all those years of torment, during which I was dutifully pouring down such nostrums and tamping in such foods as my changing procession of advisers sagely advocated, I noted that, though their prescriptions differed in marked degree, one fixed tenet of the profession remained inviolate—never under any circumstances was I to eat or drink or do anything that was pleasant or attractive.

They broke my toddy glass; they gave my consoling pipe away and hid my twist of natural leaf. They made mealtime a period of solemn consideration and deliberate action; they rousted me at dawn to walk barefooted on the verdant, gently undulating lawn; they substituted Roastum for my Java and exploded wheat for my ham-and. When my whole inner being was sending frantic S. O. S. calls for porterhouse and mushrooms with a side dish of olives, they handed me a pallid cereal, six prunes and some raw lettuce, telling me to chew every morsel thirty-two times, and rest in peace and enjoy myself no more.

Every ailment eventually arrives at a climax; mine did when somebody, or a succession of somebodies, discovered vitamines, calories and heat units, with a consequent revision of my menu, which, by this time, was like the moon, the inconstant moon, which daily changes in her circled orb.

Right there, the *little woman* rose up and *set her foot down.*

This *little woman* is not a scientist, medical or domestic. Her whole philosophy is embraced in an intensive study of cause and effect. Quiet observation had convinced her that if I drank a quart of fresh milk as per order and did plain and fancy contortions in bed that night, then fresh milk must have been received by my stomach with the same degree of grateful appreciation exhibited by the United States Senate when it read Hanihara's note on the Japanese exclusion question.

This is no attempt to cloak my frail consort with a wisdom superior to that of the medical profession, which is held in the highest esteem by both of us. The simple fact was that she possessed certain opportunities for observation. When I dined on steak, coleslaw and onions, and lay on my own side without pulling covers, she made mental notes.

Mind you, she is concerned not a whit with theory, but only with results. She doesn't know today whether my trouble was fashionable gastritis or plebeian stomach ache. She wouldn't know a vitamine from the Einstein theory.

But she decorates the frugal board with savory pabulum which staves off muscular atrophy and dispels hypochondria. I wouldn't say it to her, but she is one stubborn-minded female. When I showed her the latest dietary list she just yawned and said: "Oh fudge!" Anybody knows that that settled it.

Neither of us ever will know exactly what was wrong with my stomach, or whether there was anything wrong with it at all when I commenced denying it almost everything that it called for. At one time we considered having a Senatorial investigation of that matter, but—what was the use?

The really important thing is that the stomach got well. It is a perfectly honest, industrious, capable organ, thankful for the blessings it receives and ever wireless for more. As McKinley said about the tariff, "the period of exclusiveness is past." I could dine at Dinty Moore's this good night, taking potluck with Jiggs and bolting things down in a manner which would cause the ghost of Fletcher to rise, and no evil would befall. Back of this statement are five bright years of gastronomical enjoyment unblighted by dietary restrictions, unmarred by jaw-counting. Like the unbribed and altruistic writers of patent medicine testimonials, I am imbued with a proper spirit of fellow-feeling which prompts me to indite my harrowing experiences, and my subsequent blessed relief, for the benefit of my brother and sister Man, who are free to take it or leave it, always with the comforting assurance that if it is of no value, it cost nothing.

A Stroll in Shanghai—Random Observations

American Woman Tells of Peddled Babies and Chinese Weddings

By MRS. L. M. CRAMER

The cobbler.

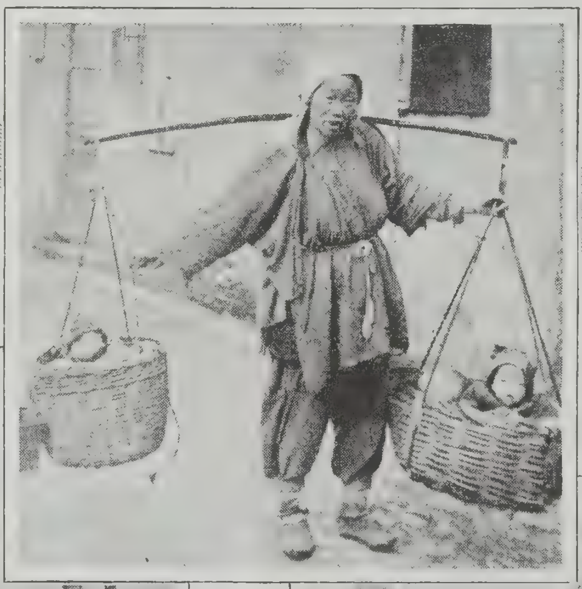
The fortune teller.

SHANGHAI is a city of modern attraction, yet with all the mystery and color of the Far East—a "city with a sky line and templesful of gods; a city with telephones—and firecrackers at funerals; a city with street cars—and silver collars around the children's necks to fool the devils into believing them dogs."

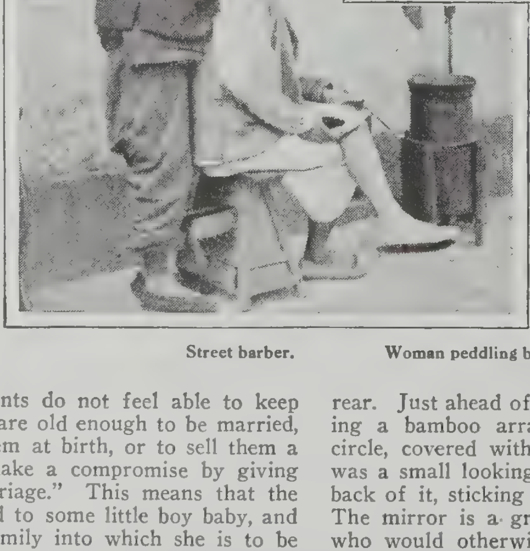
At the corner of Honan Road and Avenue Edward VII there is an attractive little silk shop conducting a ten-day sale in wonderful and beautiful silks. A strictly native shop, its customers are Chinese, and a foreigner would have a hard time getting waited upon, unless he spoke the Chinese language, for no clerk speaks anything else. Every day for a week I have had my ricksha coolie take me past that shop that I might hear a very good Chinese band play "John Brown's Body," and not mutilate it. The band would do credit to many small-town bands at home, and it includes in its repertoire such selections as "The Long, Long Trail," "Over There," and "There'll Be a Hot Time in the Old Town Tonight." The latter selection, by the way, is a favorite band piece at the big Chinese funerals—it is good to march to, and nobody knows the words anyway.

Since the sale began the band has played from nine o'clock in the morning till ten o'clock at night, with hardly enough intermission, it would seem, to allow the big tuba player to catch his breath. But it is not playing to attract customers, as we from the States might suppose, but to drive away devils. The noise is assurance to any prospective customer that not only will it be perfectly safe to enter the store, but also that good joss will attend the purchase and continue with it until the beautiful silk is made up in long skirts for father or into long pants for mother. No devil will molest a customer or a store with all that noise going on.

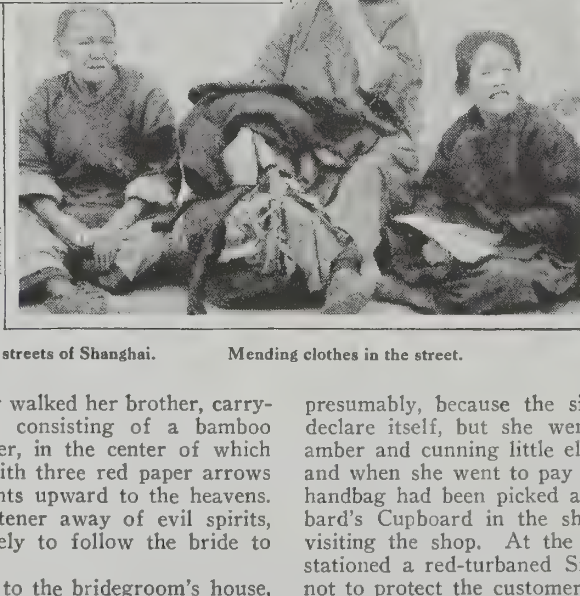
Two baskets full of baby girls were being peddled from back door to back door in the best shopping district in Shanghai one day recently. As Chinese babies go, they were cunning little things and seemed very intelligent, their only fault being that they were not boys. They seemed quite to enjoy their excursion into the hurrying streets, and they cooed and gurgled as they looked from their baskets out into a world that evidently did not want them—but they did not smile. I have yet to see a Chinese baby smile, even a child of a well-to-do family. The world they looked upon that day was a bright and smiling one, but the miseries which little girls thus sold are almost sure to endure made me offer a little prayer that they might both be stricken dead, right there and then. But they were not, and I turned and watched after the woman and her human wares, as she sang her chanty song which told what she had for sale. In China the peddler sings his wares, each ware having a little chanty all its own.



Woman peddling babies in the streets of Shanghai.



Street barber.



Mending clothes in the street.

Oftentimes if the parents do not feel able to keep their daughters until they are old enough to be married, and yet hesitate to kill them at birth, or to sell them a few months later, they make a compromise by giving the child in "rearing marriage." This means that the little baby girl is betrothed to some little boy baby, and then made over to the family into which she is to be married, to be brought up by that family, and married whenever their convenience dictates. Naturally the little things become in reality little slaves to their future mothers-in-law, and are often treated most cruelly. To give a child in "rearing marriage" is a confession of weakness and poverty on the part of her natural parents, and she will be looked down upon throughout her life. It is eminently unfair to the little girl, but China *is* unfair to her little girls. In the family of her father-in-law-to-be, all too often the little girl is known as a "ya-t 'ou," or slave girl, and the application is made just as we speak of our own little girl as "daughter."

A most decorative affair is the Chinese wedding chair which carries the bride from the home of her parents to the home of the parents of the man she is to marry. Down Thibet Road the other day I caught up with one, and if I must admit it, I had my ricksha coolie follow it on to the home of the bride, that I might see what I could see. Curiosity is not resented in China, as it would be in almost any other place. The Chinese themselves are the most curious humans on earth. Down a narrow alley leading off Thibet Road we turned, and went almost its crooked length, the bridal chair leading. Arrived at the home of the bride, we found ragged little boys carrying most gorgeous banners, and other barefooted, dirty youngsters, all about nine years old, with gorgeous cloth of gold gowns, and with fearful and awesome headdresses crowning their shaven pates. In front of the door stood a bushel basket, its top covered by red paper. After a short wait, the door was flung open and the bride, all in red, dashed madly out, chased by her wailing mother. The mother must wail though she be tickled stiff to get her daughter married off, for if she did not wail the daughter's first child would be born deaf and dumb. And the daughter must be "forced" out of the house, no matter how glad she may be to go, otherwise her family would lose face, and it is a terrible thing to lose "face" in China. As the young bride was forced out of the house, she was rudely pushed into a market basket, and then someone threw chopsticks at her, all of which portends good luck and plenty of rice to eat in her new home.

The bride was placed in her glittering chair, the curtains pulled close, to shut out all prying eyes, and the procession started, the bridal chair bringing up the rear. Just ahead of the chair walked her brother, carrying a bamboo arrangement, consisting of a bamboo circle, covered with red paper, in the center of which was a small looking glass, with three red paper arrows back of it, sticking their points upward to the heavens. The mirror is a great frightener away of evil spirits, who would otherwise be likely to follow the bride to her new home.

I followed the procession to the bridegroom's house, where I saw a table that had been placed in front of the door, on which had been arranged a pint measure, candles, incense and paper. Before our eyes they killed a rooster, and sprinkled its blood around the bridal chair, while the master of ceremonies—or he appeared to be that—recited some lines in Chinese. When his little speech was finished, the bride, still alone, went inside the house, and my coolie turned around and pad-padded his swift way to the Yellow Jacket Tea Room, from which objective his passenger, "the foreign devil," had diverted his way a half hour before.

Professional beggars in China are always under foot. They are a well-organized "profession" having their own guild, a powerful organization with which all China must reckon. The guild has a code of ethics as rigid as that of the American medical profession. The Shanghai beggar guild has its headquarters in the Temple of the Daughter of Heaven, on Honan Road, north. Into this guild hall is reported to the chief such information as will be of assistance to the members. Notices of shops about to open, opportunities for possible blackmail, are received and tabulated. Here are made arrangements for furnishing bearers for funeral and bridal processions.

Once it has been reported that a wedding is to take place at a given date, or that a funeral is to be held from a certain house, a representative of the guild is sent to the family concerned, and there is usually a gift of cumsha (money) paid over to the guild representatives; but if the family cannot or will not make this little contribution to the guild, then hordes of beggars surround his house on the day of the feast—for both weddings and deaths are the occasions for feasts—and these beggars will steal everybody blind. But let the family concerned come across with sufficient cumsha, and immediately a little strip of red paper is fastened to the lintel, which guarantees that that place will be as free of beggars as the North Pole is of mosquitoes.

One day last December a merchant opened a new shop on Nanking Road. That is, he intended to open it, but he refused cumsha when waited upon by the Commander-in-Chief of the Beggars Guild, and on the morning of the opening for a block either side of his shop the beggars were massed. Police dispersed them, of course, and after that stood guard so that no crowd congregated, but a few managed to slip through and hectored the prospective customers till they were lost to the shop. After two days the shopkeeper "came through" but his hesitancy cost him a pretty penny, not only at the time, but in loss of that class of trade he had hoped to attract. Now, early in March, the store has a "To Let" sign on it.

And there is a Thieves Guild also. Where on earth, except in China, could a Thieves Guild exist, to say nothing of flourishing like a green bay tree, as is the case of the guild in Shanghai? This guild has its regular markets—one is situated down in the best business section of Shanghai, and does a thriving business. One of the passengers on the *Laconia*, a round-the-world tourist boat visiting Shanghai late in February, visited that market. She did not know that it was a Thieves Market, presumably, because the sign over the door does not declare itself, but she went and she bought jade and amber and cunning little elephants carved out of ivory, and when she went to pay for them she found that her handbag had been picked as bare as Old Mother Hubbard's Cupboard in the short half-hour she had been visiting the shop. At the door of the shop is always stationed a red-turbaned Sikh, whose duty evidently is not to protect the customers within the shop.

But the Beggars Guild and the Thieves Guild are neither of them all bad—at the time of the Famine Relief Drive both organizations made substantial contributions to the fund.

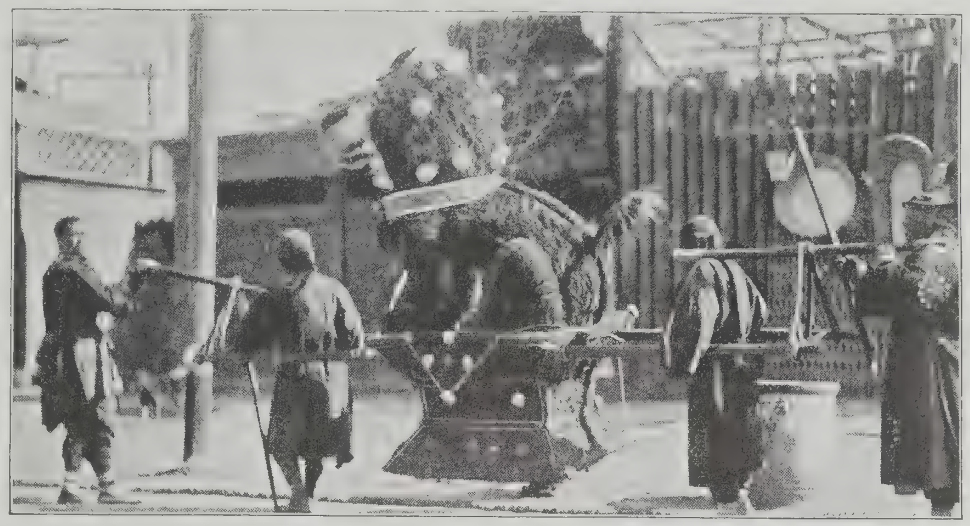
Beggars who ply their trade by the help of children are the ones who reap the golden harvests from the tourist in Shanghai. The beggars are wily—they know human nature and they know the foreigner. If the child who assists them is deformed or looks to be starving they know it is a great asset, and terrible stories are told of children almost starved while their owners, oftentimes their own parents, are fed on the fat of the land, which in China is presumably a full rice bowl with occasionally nice fat pork. Other stories drift out to one, which tell of newly born babies who are placed in an earthenware jar with only their heads sticking out, and who are kept in this barbarous cradle for two or three years. When the jar is at last broken the child's distorted legs, and its wizened body, with its head of normal size, make it an invaluable asset for the Beggars Guild. There is an old Chinese proverb which runs like this: "Be a beggar for three years and you wouldn't trade places with a Mandarin." There surely must be money in it or so many would not be following the profession.

There is an apparent lack of sympathy among the Chinese. Dr. Arthur Williams, who has spent nearly a half-century in China and knows what he writes about, relates an instance which gives an insight into this characteristic. There are a couple of American gunboats anchored in Shanghai Bay, just off the Bund. One day an officer heard a cry as of a human in great distress, and he rushed to the side of his ship in time to see a Chinese boatman floundering in the water and begging piteously for some one to save him. The man was apparently about exhausted, but other boatmen all around him were watching his struggles as though it was all a good joke. They were laughing and calling out pleasantries to him, but refusing to make any effort to save him. The United States officer dispatched one of his seamen to save the drowning man, and the chap was pulled out of the water. Later on the naval officer found out why no one of his own class would make any effort to save the drowning man, or help him to save himself. To rescue a man from impending death through accident, it seems, would mean that from the time the rescue was performed, till he died, that man would belong to his rescuer, and if he decided not to work, that the rescuer would have to support him all the days of his life.

A familiar sight all through China is the fortune teller. In Shanghai their stalls are legion. Sandwiched in between foreign shops on lower Nanking Road, they are everywhere to be found. In the picture Lao Wong smiles. The fortune teller possibly has seen it in the cards that Lao Wong is going to have good joss. Maybe the fortune teller has predicted a good job with a wealthy "foreign devil" which will bring him in the stunning salary of $10 (Mex.) a month. That will be but five dollars gold, but Lao Wong and his family of five will live in luxury on that amount—and besides the "Melican" man is always good for considerable "squeeze."

The cobbler of Shanghai comes to your door, sings his expertness as a mender of worn footwear, does a neat job despite his primitive tools, and charges a price which makes the American smile—it is a few coppers, and home it would have cost two dollars gold.

In large cities in China the police force is quite westernized, but in the outports and in the interior the custom still obtains of a policeman or watchman walking his rounds, beating a small brass cymbal, and flashing his lighted lantern, thus warning thieves and men of like calling of his approach, thereby giving them opportunity to get out of the way.



An image in a funeral procession, intended to scare away evil spirits.

On the coldest days of winter and in the heated summer months, you will see the little sewing amahs, sitting on the sidewalks mending clothes. They walk along the streets of shops, and a coolie, passing, takes off his one upper garment and pauses while the little old women with nimble fingers mend the rent in his jacket. Outside the shop door she sits, as she mends the silk and fur-lined garment of the merchant within. She is a homey looking little woman, sometimes very old, and sometimes hardly in her womanhood, but she is patient, and generally seems content with her lot. Occasionally she has a baby strapped to her back, which looks over her protecting shoulder, watching in round-eyed wonder a world of people pass by, most interested, perhaps, in the children rushing by on their "scooters," for in China, which is the same today in most things as it was five hundred years ago, the children's one toy seems to be an up-to-the-minute American contraption, the scooter.

The street barber is an interesting fellow. In the large cities regular barber shops are to be found, but it is the street barber that shaves the majority of men. In the small places the traveling barber shaves your face, cuts your hair, braids your queue, if you happen to have one, cleans your ears and with his little tweezers removes stray hairs from nose and ears. Even the coolie, the lowest type of human life in China, considered intellectually, is very particular about his nose and ears—no stray hair must show there, or he loses "face."

The carrier coolie is bringing his live pigs to market. Squealing every step of the way, the pigs resent the liberty taken with their means of locomotion, and every step of the way the carrier coolies sing their queer little chanty-like songs. No matter how hard they are worked or how tired they may be, the carrier coolies sing their chanty from early morning till late at night.

These little chanties are fascinating. If two carrier coolies are on the same job, the leader will sing—it is really more like a musical grunt—for two or three notes and then the other coolie will sing-grunt an answer, and thus they continue all day. One who has lived for a great many years in China translated a song to me one day. I wish I could reproduce the music of it, but no one can remember it a minute after hearing it, so elusively haunting is it. The first man sang: "I am very strong," and the other coolie answered, "So am I." Sometimes while they are singing, they laugh good-naturedly at the foreigner who stops to watch them, and then they add a new note or two, presumably making good fun of the "foreign devil," and when this happens all the natives about will laugh and double up with glee. Probably it is just as well that you don't understand, for the Chinese have a way of calling a spade a spade that would bring blushes to the face of an American Indian.

The Hottest Spot in the United States

Concluded from page 10

With the expensive electrical pumping system now in use in parts of the date region, young palms must be irrigated twice a week during the hot arid summer, and less frequently the rest of the year. It is hardly possible to hire labor experienced in date culture, so it is expensive to get competent help that will rightly care for palms. The cost of such care is estimated at five dollars the tree for the first year.

Thus at present prices a date garden will have cost per acre at one year old approximately:

50 X $20 (average),	$1000, offshoots.
50 X 1	50, to set.
50 X 5	250, care, water, taxes.
	$1300, per acre.

Add to this the price of raw land, from $100 to $300; grading and leveling, $25 to $100 an acre; well and pumping plant, $50 to $250 an acre, according to size of tract, and the result is some $1,500 to $2,000 to bring an acre of pedigreed dates to the end of the first year. But further expenditure to carry this acre to bearing at about five years of age pushes the average up to from $2,250 or $3,000 as a fair estimate given by responsible date growers. Many farmers lessen these costs by intercropping or by sale of offshoots.

So what will a million dollars do in the date region? It will bring to self-supporting age about 400 acres of palms. That's all. Not a poor man's business! Nor a rich man's, since, as in the case of day labor, it is rare to find, at $5,000 or $10,000 a year, a manager who knows his dates and it takes time to learn the business. In two local cases the rich man has taken the high-salaried man into partnership and a third managerial find had long experience in government employ. Indeed many of the farmers who are successful with dates are college men.

The industry is perhaps most satisfactorily carried on by the well-to-do farmer who grows into it, or by the man who intercrops with truck or turkeys while he cares for his one acre of dates, looking to the golden day when they may maintain him and his family.

Thus the costs make a safeguard against the too rapid expansion of this new industry of the western frontier. There are two other safeguards: First, the Federal government has full control of further importation of foreign offshoots and can forbid it if necessary. Again, palms produce only about as fast as dairy cattle, so it is impossible at this time to expand the business, as with grapefruit, for example. Enough grapefruit can be purchased to plant 1,000 or 10,000 acres without much trouble, in any good year. But it is impossible now to get enough standard offshoots to plant fifty acres.

Getting down to figures of commercial value it is shown that there are approximately 1,000 acres planted to dates in Coachella Valley, of which about sixty per cent, 600 acres, is bearing. This bearing acreage is divided about as follows: 200 acres, seedlings; 300 acres, Deglet Noor; 100 acres, Khadrawi and miscellaneous imported varieties. It is estimated that sixty to eighty per cent of the offshoots have been already removed from the standard imported varieties now bearing.

The 400 acres not yet bearing is but one generation descended from the imported stock and will be the principal source from which offshoots will be provided for future expansion of the industry. In the two co-operative quarantine nurseries of 10,000 imported offshoots, it is assumed that fifty per cent will live, from which the increase, to be sold at minimum price, will make an additional source of valley planting.

The 1923 yield is given authoritatively as about 450,000 pounds, of which fully 250,000 pounds were Deglet Noor. At home this pouhdage looks big. It is a drop in the bucket against our foreign importation of dates, the reported increase of which only shows increased consumption of this fruit and recognition of its excellent food value.

More than two millions is invested in dates in Coachella Valley alone, while one large concern represents its assets at a million. Continuous with Coachella Valley, the region of the Southwest where date raising is possible runs into Imperial, Yuma and Salt River valleys; then with a break appears again on the lower Rio Grande. It is found in corresponding parts of Mexico and along both sides of the Gulf of California. For each of these spots has been or will be found the exact variety of date best adapted to soil or climate conditions.

A hundred years from now government authorities see in these places a huge oasis where date raising will predominate, the valiant offspring of present costly experimentation and desert pioneering.

Meantime, in the hottest spot in America, Coachella Valley, the most unique spot—which will be an important intervening section between the coast and the Boulder Dam project—are the marvelous desert beauty and the ideal winter climate, that ten years hence will make it a resort for the wealthy who want their desert scenery unobstructed by city crowds or board walks, and set off with a charming background of palm-planted oases.

In the Old World to reach a resort of like winter climate, one goes from Nice across the Mediterranean, across the Atlas Mountains, at great cost of time and money, Dr. Swingle found, while our desert date region is only a five-hour motor trip from the harbor, on paved boulevards. Here in the hill coves, sheltered from seasonal winds, those with vision foresee the planting of future winter resorts.

Taking the Cruelty Out of the Movies

Concluded from page 3

tary quarters. In some of the lion and dog cages, there were four animals in a cage scarcely large enough for one. The neglect of the dogs was pitiful. I gave one water, and he drank for five minutes. I found that one Stecker was in charge of the zoo, and that he had been discharged by the Selig Zoo because of his unspeakable cruelties to the animals under his control.

"I took up the matter with General Manager Bernheim, but it was not until I appealed directly to Mr. Laemmle that conditions were changed."

Though these conditions had been going on at the Universal City zoo for some years, and repeated complaints had been made by persons familiar with the situation, nothing was done until the Animal Defense League prepared criminal charges against the management, and so informed Laemmle. The latter pleaded ignorance of true conditions, regardless of the length of time these conditions had persisted, and finally made a clean-up of Stecker and of his relatives and associates.

"There are, however," Mrs. Wright continued in her talk with me, "some producers of animal motion pictures, and of motion picture plays involving animals, who get the greatest results by kindness and patience alone. Nell Shipman, as one example, has proved that animals can be used successfully in motion pictures without resorting to cruelty, or even to harsh methods. Not one of the 187 animals in her zoo has ever felt the sting of a whip, and in her recent production, 'The Grub-Stake,' it is easy to see that the animal actors are happy in their 'work.' When the action of the story calls on an animal to perform some new stunt, Miss Shipman and her director, Nert Van Tuyle, spend days and even weeks acting with the animal, until the latter knows what is wanted of him, and how to do it. Then he does it to please those who have been kind to him.

"Laurence Trimble, director of 'Strongheart' and producer of the famous dog's pictures, is another. This animal has been trained entirely by kindness, love and patience, and he is beyond all doubt the greatest animal 'actor' in the world. Trimble has 150 dogs and wolves in Canada, and a large number of dogs, including 'Strongheart' and 'Julie,' his mate, on the Trimble ranch in the San Fernando Valley, near Los Angeles. Whips, clubs, wires, 'dope' are all unknown to these animals, and their pictures speak for themselves. All other animal pictures could be made the same way, and, unless the brutal ones among the animal trainers for the stage, the circus and the motion pictures change their methods, with the exposures that are now being made, it will not be long until the American people demand that all animals, except those trained by kindness, be eliminated from the screen."

Control of Credit Must Yield to Free Competition of Credit

By JOHN BASIL BARNHILL

INTEREST is the toll exacted from society by the holders of gold or the call upon gold by virtue of the circulating advantage of the latter over other forms of wealth.

The statesmen of the world are as clay in the hands of the all-powerful gold pool.

The present system of finance is systematic in this sense only, that it is an almost perfect device to enable the holders of gold to manipulate all values and gather them into their private vaults.

The absurdity of the situation is equaled only by its tragedy, for it amounts to this: that unless a man can produce gold, he will not be allowed to produce anything else. Such are the arresting statements in a recent English work, "The Menace of the Money Power," whose author, Mr. Charles Percival Isaac, is acclaimed with singular unanimity by the British press as an authority who must be reckoned with.

The author asserts that the distresses into which the world has fallen—distresses aggravated by the war but in full tide before that catastrophe—are due to the restriction of credit by the state. Society is in thrall to a body of financial magnates, who inflate or depress as they think most conducive to their own greater enrichment. "They transfer their activities from wheat to public debt, from public debt to oil, from oil to sugar, from sugar to railroad system. No market can withstand their influence."

Must Be Credit Specialist

WHAT is the remedy for this situation? "Artificial centripetalism must give place to a natural centrifugalism. Control of finance must yield to free competition in credit. The call on gold as a basis of industry must be supplanted by the claim to real wealth . . . . With the reversal of the financial system, the pools, the trusts, the limited liability companies will disappear. The creditable individual will obtain credit facilities to initiate enterprise. The banker will be . . . . a credit specialist."

* * *

"The increasing wealth of the community will form the basis of more ample credit than gold could furnish. The smaller producer will be able to compete on an equality with the larger producer. The workman will find employment at a just wage and will have an open avenue to ascend to that position in the social system to which his constructive ability and his productive capacity entitle him."

Thus it will be seen that the author's panacea for our financial ills is freedom for banks—for local banks in different parts of the country—to issue notes. In that way, he argues, the flow of money would be centrifugal; it would be dispersed. As it is, the flow is centripetal and daily grows more concentrated. He is not afraid that the banks would commit the folly of an over-issue of paper. He strengthens his argument by reference to the freedom of the Scottish banks to issue notes of low denomination and to the subsequent benefit to Scottish industry and commerce.

Lord Acton, in his essay on Liberty, wrote: "Solon was the profoundest political genius of antiquity. Before Solon's time the only resource against political despotism that had been known was the concentration of power. Solon undertook to effect the same object by the distribution of power." In the spirit of Solon, Mr. Isaac finds that in finance, no less than in politics, the supreme problem is to accomplish a redistribution of power. Against the centripetal policies beloved of the reigning school of finance, he seeks to find the centrifugal policies which would redistribute financial power and give to commerce that freedom without which all things languish and die.

"During the century and a half that Scotland enjoyed free banking it rose from an obscure, backward country to one of the most industrial communities the world had ever known. In spite of the comparative barrenness of the soil, its agriculture ranked among the best in the world. Farm leases were lengthened to nineteen years, whereas in England they rarely extended to more than one year. Its prosperity was manifest and was untroubled by those recurring financial spasms that caused such havoc in England. The historical test affords complete proof of the superiority of free banking over restricted banking.

"The old note-issuing country banks were the stimulators of the spirit of enterprise that enabled England to make its extraordinary forward bound at the beginning of the industrial era. When note issue was stopped, banks ceased to promote enterprise. Any such step was not consonant with the artificial form of check-overdraft banking.

"Curiously enough the joint-stock banks advertise the huge amounts of deposits that they owe as a sign of their stability. It is to some extent an index of the confidence that the public has in them but reflection will show that these deposits are in reality a huge liability which could not be met at any given moment. . . ."

* * *

"The Panic of 1907 in the United States was not due to excessive note issues. It was due to that economic arch-folly, state intervention in note circulation. The crisis passed as soon as the banks issued clearing-house certificates. . . ."

* * *

"Credit is being withdrawn from the directly productive members of society and extended to financial middlemen. There has been an increase of so-called public credit. The fact that states and municipalities waste the community's resources is lost to sight. *Yet public loans are not pure credit at all. They are only partially voluntary. They are based, not upon productivity, but upon taxation. The credit of a community is thought to be inexhaustible because the power of taxation has not been seriously challenged. . . .*

"The collapse of the financial systems of Central Europe is the outcome of a refusal to recognize the elementary truth that a credit instrument must be free from all constraint . . . . With the advent of paper money, power passed from the kings to the politicians. The latter have not yet learned the lesson that the kings were taught by their experience in debasing the coinage. Statesmen still think that coercive credit is better than free credit, that evidences of public debt are as good as evidences of real wealth or productive ability. They have suppressed the free note in favor of the privileged note. They have even suppressed or limited the privileged note in favor of the state note. Everywhere the result has been the same. Forced paper currency has always become debased. Statesmen have multiplied evidences of public debt so enormously that the community can no longer absorb them. The banks have been obliged to take up huge proportions of public issues. The pressure exerted upon them by the state's hold on the central gold reserve left them no other course."

* * *

"The British joint-stock banks were forbidden to issue notes. They had to find a substitute. Now that the law had suppressed the better form, the note, the lower form, the check, again came into use. The check, rightly considered, is not a form of credit at all; it is simply a method of payment. A check drawn by any one against his deposit at a bank does not represent a credit. The deposit itself represents a credit from the individual to the bank. Such credit is useless to industry until the bank puts it at the disposal of producers. This is done by an overdraft; not by an actual loan of gold, but by giving the producer a call upon a certain quantity of gold. The difference between note credit and overdraft credit is of the utmost importance. To ignore it is to vitiate the whole science of economy. The check is centripetal, the note is centrifugal. The tendency of the note, in normal times of industry, is to circulate further and further from its point of issue, to penetrate through all the industrial layers, from the biggest producer to the most menial wage-earner. The tendency of the check is in the reverse direction. Its trend is to be presented for payment or cancellation through the clearing house as soon as possible.

Result of Present System

"THE upholders of the present centripetal system of banking maintain that the concentration of reserves in one national store is a good thing. It must be pointed out, however, that economy is not a national but a world science, and that a nation's political boundaries do not correspond to a community's economic ones. The influence that has produced a centralized store of gold in the state bank is not economical but political in origin. It is the result of legal restrictions of note issue.

"Prohibition of free note-issuing banks limits fresh enterprise. Limited companies favor large concerns. Financial trusts obtain control of the large concerns and pools manipulate the trusts. The centripetal system lures from the individual his meager cash store. The branch bank hands it over to the head bank, the head bank places it in the central bank . . . . The central store of gold in every nation is at the mercy of the pool interests. The banks themselves dare not refuse to obey the directions they receive. The pools have the effective call upon gold and by use of that call they obtain control of industry. The industrial trust is an effect of their operations . . . . The expansion of industry and specialization of function combine to create a need for greater credit facilities. But the control of such facilities passes into fewer and fewer hands. Permanent credit stringency is the result. *First agriculture declines, then small tradesmen tend to disappear, then the smaller companies are forced to unite with larger ones and finally the larger ones are compelled to combine.*

"Let us face the facts squarely. Centripetal finance has given the oil control of the world over to two competing groups. Centripetal finance has caused credit starvation throughout Europe. It has brought the economic system to the verge of complete collapse and the more militant financial interests are preparing for the fight for complete control of the world's destiny. . . .

"There is one remedy. The system which has brought us to the edge of complete disaster must be altered. The removal of state restrictions will allow a gradual growth of the note-issuing bank. The volume of notes will increase and decrease, not in accord with the preconceived fancies of politicians, but in accord with the needs of the community. They will be based, not upon debt or negative wealth, but upon production or positive wealth. The marginal differentiation which has worked in favor of the possessors of the call upon gold, will, under a free system, work in favor of creative ability. Bureaucracies will diminish because a commercial career will offer a better scope than a non-productive official life. Economics will become a study of wealth, not of poverty. The notion that the centralization of credit resources could, in any possible way, lead to the diffusion of wealth is not only the antithesis of scientific thought: it is a contradiction of every form of horse sense . . . ."

Ramsey Macdonald Interprets Military Motive

THERE has been much talk in the last hundred years in every country in the world about freeing foreign policy from the dominance of the military motive; but the present government of Britain is translating the talk into action. It is actually subordinating considerations of military power to those of fairness, friendliness and the square deal.

This is not the least of the changes in the international, as well as the national, outlook, that is emerging from the bloodless revolution consequent on Mr. Asquith's recent little play of using the Socialist party as the cat's-paw to pull his chestnuts out of the fire. With the advent of the Laborites to office, the whole question of armaments bids fair to become a burning issue. In a recent speech in the House, the Prime Minister, Ramsay Macdonald, replying to a question by Mr. Baldwin, his predecessor and now leader of the Opposition, intimated that the whole matter of imperial defense was being taken up and explored "in a very much wider way than it had been hitherto.

"It has been said that it would help me very much if I had this force or that force behind me. My reply is, 'Not at all—you are very much mistaken. For some time to come, the bargaining power of the British Foreign Secretary is not to depend at all upon military force, but upon the *reasonableness* of the policy which he represented.' . . . . The government is not going to assume that the problem of national defense is purely and solely military."

These remarks indicate that the Premier is under no delusion as to the manner in which the task of reducing armaments ought to be approached by a statesman to whom the phrase "world peace" is more than a formula. Obviously, there is the closest possible connection in his mind between foreign policy and war or peace. It would seem to be his idea that by a policy based on reason and not on armaments, it will soon be possible, not only in Britain, but also in every other country, to decrease the national expenditure on armed forces.

Reasonableness of Policy

THIS policy involves certain delicate points in the present situation—points that offer the acid test of real statesmanship. The Baldwin administration, shortly before the last general election, launched an emergency shipbuilding program which, while coming well within the terms of the Washington Agreement, was designed to relieve the unemployment distress—there are more than two million idle workers in Britain today being sustained by payments from the national treasury under the National Unemployment Insurance scheme, less euphemistically called "the dole" —while anticipating replacements of obsolescent vessels, replacements that would have to be made in any event within the next two or three years.

Until yesterday it seemed probable that the new government would decide against carrying out this naval building program. Indeed, the Chancellor of the Exchequer, Philip Snowden, had publicly expressed the view that the money designed to be spent on this program, amounting to some £6,000,000 ($30,000,000), ought to be diverted to other purposes, particularly to building houses, the house shortage in Great Britain today being some half-million dwellings, reckoning the needs of the population at a much lower standard than would be tolerated by the workers of the United States. "Houses before ships!" is Mr. Snowden's slogan, and it is no secret that his view is shared by several of his colleagues in the government.

The Baldwin Government proposed to lay down immediately eight light cruisers, three of them in the royal dockyards and the remaining five by contract in private yards. The program also included three submarines and a submarine depot ship, two destroyers and a destroyer depot ship, two gunboats of a special type for the Persian Gulf, an aircraft carrier and a mine-laying vessel. The Unemployment Committee of the Cabinet, which has had the whole matter under investigation for several weeks, brought in a report strongly urging the carrying out of this program as an immediate method of relieving the unemployment distress, especially as it would take months at least before any other adequate measures can be matured and these naval replacements are bound to come up later as urgency measures if not carried out now.

So Ramsay Macdonald informed the House of Commons that a bill would be brought in for the execution of Mr. Baldwin's naval program with some reductions, namely, calling for five light cruisers instead of eight and a cutting out of the auxiliary craft. He defended his decision ably, insisting that it involved no least departure from his pacifist principles and policy, that it would be poor economy to "allow the nation's navy to rot from the bottom upward," and that he was as unalterably opposed as ever to any increase of armaments, sea, land or air. Furthermore, he promised a substantial cut in the navy estimates. Mr. Amery, First Lord of the Admiralty in the late government and responsible for the original program, paid a high tribute to the Premier's clear common sense and practical course; but it was severely dealt with not only by the Liberals, but also by a number of the Labor members. Then happened one of the queer things that happen only in this tight little isle. In a preliminary test of strength on a vote to consider the matter, the Socialist government was saved from defeat only by the solid vote of the Conservatives whom they had turned out of office a few weeks before with the aid of the Liberals; the Liberals voting almost solidly against the government which they had placed in office!

Ramsay Macdonald has turned a bad corner, but his troubles are not over.

President's Back Yard Has One Apple Tree

A Garden of Old-Fashioned Flowers Graces the White House Private Grounds

By GEORGE H. DACY

DID you ever hear about the famous Presidential apple tree, the only edible-fruit-bearing tree that adorns the White House grounds in Washington?

Probably you have not, since only a very few Americans know about the proudest fruit tree in all America, which raises its leafy foliage and rears its beautiful blossoms within sight of President Coolidge's bedroom window.

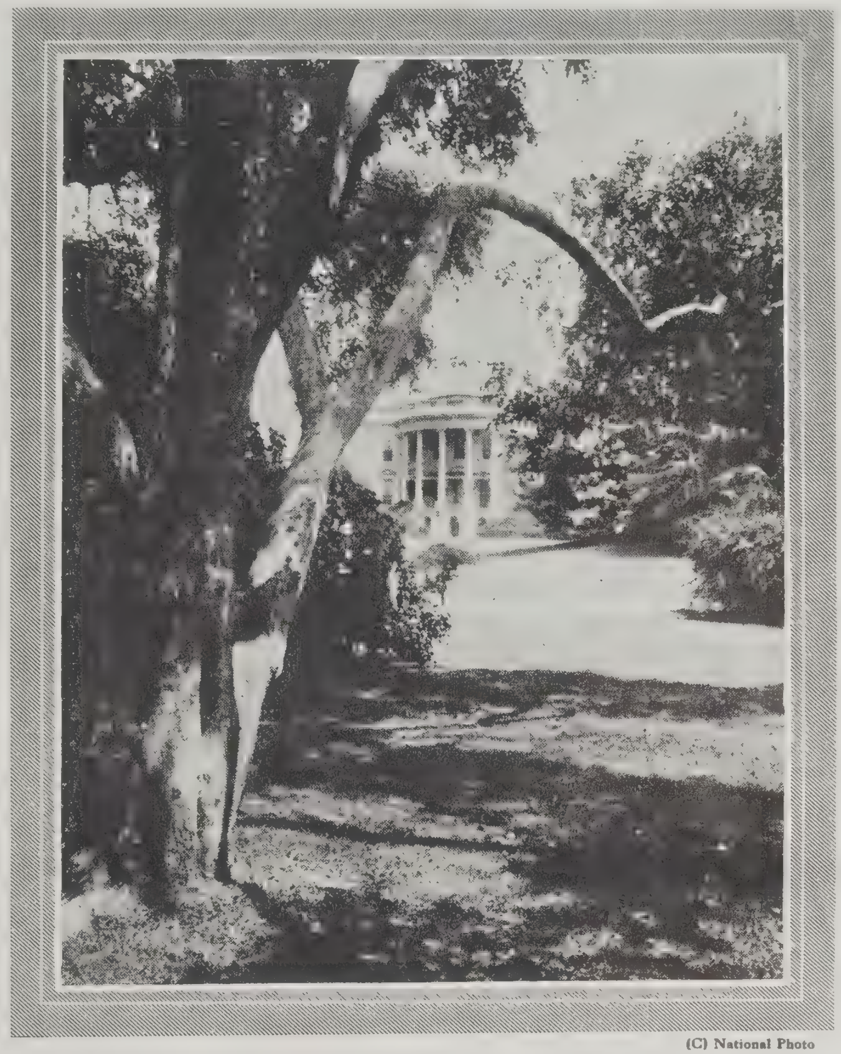
Unwept, unhonored and unsung, this veteran producer of delicious, rosy-cheeked apples has witnessed the advent and retreat of twenty odd different Presidential administrations. As an established resident of the miniature White House grounds forest, it has welcomed and bid adieu to the occupants of the Executive Mansion from the time of President Adams to the coming of President Coolidge. The graceful and dignified old fruit tree—a fitting representative of horticulture and pomology at the White House—will probably continue to provide a wealth of shade, an abundance of fruit and a springtime galaxy of glorious blooms through many more administrations.

Neither White House chronicles nor the memory of the oldest employe at the Executive Mansion in Washington disclose when the old apple tree was planted, nor why. Maybe it dates back to the days when leisurely kine grazed on the White House lawn and provided the Presidential family with plenty of milk and cream. Yes, in the bygone days, the President of the United States used to keep a couple of cows. In one of the basement rooms of the White House, which now is used for coal storage, set in the floor, are two marble troughs which scores of years ago used to serve for milk storage and cooling purposes. In those days, the room in question was the White House dairy where milk and cream were kept and where butter was made.

The old apple tree never gets lonesome where it has stood deep-rooted for scores of years. Not far distant are three wild crab apple trees. In the month of May, when Washington is resplendent in flowers, ornamental plantings and sunshine, the three crab apple trees and the lone apple tree on the White House lawn add their blossomed beauty to the attractiveness of the national estate.

You can let your fancy run riot concerning the history of the White House apple tree. Perhaps it is a tree that George Washington planted when he first resided in America's most historical home in the national capital to square his debt with forestry conservation for the famous tree he chopped down as a boy. Perhaps there was a shortage in the apple crop during the days when Thomas Jefferson was President. Possibly Mr. Jefferson planted the apple tree, as he was a far-sighted farmer and greatly interested in agriculture. Albeit, the apple tree of unknown history and puzzling antecedents still stands as solidly and substantially as any fruit tree in the eastern states.

Within a stone's throw of the notable apple tree is the old-fashioned garden which ornaments the eastern side of the White House. This garden, revived by Mrs. Woodrow Wilson, and perpetuated by Mrs. Warren Harding, will be maintained and extended under the direction of Mrs. Coolidge, who delights in many of the quaint, old-fashioned flowers that it contains. The venerable varieties of flowers produced in the remarkable garden include phlox, peonies, chrysanthemums, delphiniums, forget-me-nots, hollyhocks, black-eyed Susans, snapdragons and other patriarchs of American floriculture.



(C) National Photo

In the shade of the old apple tree at the White House grounds. It is the only edible fruit tree on the fourteen-acre estate.

Bordering the several White House fountains which beautify the grounds are ornamental plantings of German and Japanese iris. A great bed of white phlox is an outstanding feature of the front lawn every spring and delights the thousands of passers-by who stroll that way. Pansies and many different varieties of bulbs, such as hyacinths, narcissuses and tulips, which prosper in the latitude of our national capital, also, in orderly sequence, ornament the spacious greensward during the spring and early summer months. The bulbs are set out in specially prepared beds during the autumn months so that they will be ready to peep forth from the fertile soil and grow to rapid maturity as soon as temperature conditions are favorable.

On the west portico of the Executive Mansion is the rose garden, where twenty-five different varieties of roses are grown each summer.

If you have visited the White House grounds you have doubtless exclaimed over the wonderful shade trees that adorn the fourteen-acre grounds. There are approximately 250 trees of some sixty-five different family names and varieties in the diminutive White House forest—if such it may be called. The trees are as prolific in variety and species as they are in shade-producing qualities. Among the most important tree species are elm, maple, beech, oak, acacia, magnolia, tulip-poplar, ash, cypress, buckeye, yew, pelonia, Japanese flowering cherry, pine, cedar of Lebanon, basswood, Japanese varnish tree and boxwood.

If any of the White House trees blow down, they are replaced by others of the same lineage and family. During the Wilson administration, a great elm toppled to the earth in a heavy windstorm. Shortly thereafter, Woodrow Wilson formally planted another elm to take the place of the fallen veteran. There are several such Presidential trees in the executive grounds. The stately elm has been most popular with the Presidential planters. William Henry Harrison set out such a tree and President Rutherford Hayes planted another.

It is reported that during the incumbency of Andrew Jackson, "Old Hickory," forsaking his namesake specimen of the forest primeval, set out several magnolias in the grounds of our fourteen-acre national estate. A beech tree planted by Theodore Roosevelt is one of the favorites with the White House visitors. About eighteen months ago, Mrs. Harding planted an evergreen variety of magnolia tree.

William McKinley planted an oak tree shortly after the Spanish-American War. This solid, substantial oak tree proved an ideal mascot, for it introduced an era of prosperity and good times.

Ornamental plantings on the roof of the White House executive offices, showing the secluded garden that links the White House and the offices.

URBANA ILL

BRIEFLY TOLD

Luther Burbank has offered his "creations gardens" to the University of California for educational and experimental purposes. He has been offered $100,000 for them, but commercial profits interest him less than the public benefit.

The New York Public Library reports 385,633 fewer volumes issued in 1923 than in 1922, though 1922 was far below the record for 1921. What is the answer—Radio?

"I am convinced from experience that it is generally far easier to straighten a boy out and give him a right start outside an institution of correction, and before he has been branded by a commitment, than after he has been committed."—*Victor P. Arnold,* Judge of the Juvenile Court of Cook County, Illinois.

Seventy-nine counties of Iowa have more cars than families.

The real reason for planting yew trees in churchyards is indicated in an excerpt from Liber Festivalis, printed by Caxton in 1483, which reads as follows: "But for reason that we have no olive that bears green leaf, we take yew instead of palm and olive and carry it in procession; and so is this day called Palm Sunday."

If early spring and summer weather conditions are favorable the tobacco crop for 1924 in Essex County, Ontario, will in all probability total 10,000,000 pounds.

One-tenth of the people of the United States, about twelve million persons, may "tune in" on the proceedings of the Republican National Convention at Cleveland, June 10. The proceedings will be relayed from station to station and so amplified that people on both the east and west coast may hear it.

The Japanese bar natives of Korea, China, Mongolia, Siam and Java from settling in Japan.

Hopkinton, New Hampshire, plans to raise on Hopkinton farms all the food the town will need in the ensuing year.

Emigrants in Southeastern Europe are taught to slip into the United States via the Canadian frontier. Shipping companies advertise Canada to Budapest, Bucharest, Belgrade, Warsaw, Danzig, Athens and other big immigration centers, assuring emigrants they will have no difficulty crossing the unguarded frontier.

While hunting rabbits, John Huckaby, fourteen years old, of Colgate, Oklahoma, uncovered an old skunk hide wrapped around $10,000 in currency.

Mary Garden has applied for first citizenship papers. She was born February 20, 1877, at Aberdeen, Scotland, emigrating to this country from Glasgow in 1883.

A deep crack has appeared in the neck of the Sphinx, according to the Egyptian Antiquities Service. It will be repaired.

"The International Jew," a four-volume series on the Jewish Question, may be obtained from The Dearborn Publishing Company, Dearborn, Michigan. This set includes:

"The International Jew," Vol. I, 235 pages; "Jewish Activities in the United States," Vol. II, 256 pages; "Jewish Influence on American Life," Vol. III, 256 pages; "Aspects of Jewish Power in the United States," Vol. IV, 246 pages. The price of these volumes is twenty-five cents each; the complete set, four volumes, one dollar.

BINDERS

Readers who desire to save their copies of The Dearborn Independent can now obtain a specially constructed cloth covered post binder. This binder is very practical, holds 52 issues and permits immediate reference to or removal of any copy without disturbing any other issues. Price $2 each delivered. Remittance must accompany orders.

Paris-green dust scattered in a malarial mosquito swamp near Mound, Louisiana, proved very successful. Airplanes flew over swamps otherwise inaccessible and scattered the dust heavily diluted with Tripoli earth.

The Mexican state of Colima declares its willingness to accept 10,000 Japanese agriculturist immigrants.

Harvard College has been presented with thirteen volumes of theology which Cotton Mather purchased from the college in 1682.

The movement to revise English spelling, initiated in 1907 and interrupted by the World War, is again in full swing. About 460 universities, colleges and normal schools use the simplified spelling method in publications and correspondence.

Is Five Years of Nonsense Long Enough?

If Business Ruled, Instead of Political Finance, Europe Would Be on the Up-Grade Now

By SAMUEL CROWTHER

UNDER ordinary circumstances the amounts which the European nations owe to one another, either for the account of reparations or for the account of money borrowed during the war, would not be of the slightest consequence to us here in America. Our affairs are only indirectly involved with those of Europe. We are not extensively in trade with Europe and have no need to be, for as compared with the buying power of the United States the buying power of Europe, even in the most prosperous times, is small, and now it is near zero.

Our export trade with Europe is valuable in disposing of a certain portion of our cotton crop, but in our manufacturing development we are each year consuming more and more of our own cotton and exporting it as finished goods rather than as raw material. Certain cereal and mineral exports are of value in taking up the slack in home consumption, and we can sell a certain number of specialties, such as automobiles, typewriters, cash registers, harvesting machines, and so on through the list of American specialties, but our manufacturers, whenever the demand abroad is great, find it cheaper wholly or in part to manufacture abroad. Europe has to have our petroleum products, not only because our Standard Oil Company has the only really adequate distribution system abroad, but also because all the European companies put together could not supply the market. The importance of our export trade to Europe has been vastly overestimated.

Money—A Medium of Speculation

BUT it is of importance to us that the countries of Europe should have a currency, and the uncertainty about reparations has done more than any other one thing to bring about the loose financial methods which have made the paper money of Europe a medium of speculation instead of a medium of exchange. We had a little taste of this ourselves when prices were soaring in 1919-1920. Suppose you were earning twenty dollars a week. You knew just about what this twenty dollars would ordinarily buy for you, but when you went to the store you found that prices had gone so high that the twenty dollars was worth only fifteen dollars in buying power. You went back to your employer, told him the circumstances, and got your pay raised to twenty-five dollars. But when you came to spend this twenty-five dollars, you found that prices had moved so far along that you could still buy less than with your old twenty dollars. The process was disheartening. There was no use saving. The thing was to get rid of money before it depreciated. Fortunately, we checked ourselves in time, but in Germany the thing went on so rapidly that it presently took about three billion paper marks to buy what one gold mark would buy before the war.

We have built up modern life on being able to exchange the goods we make for money and then exchange that money for other goods. Barter is impossible excepting in a small community of simple needs. But naturally if the medium of exchange varies widely in value it is no longer a medium of exchange and instead of selling your goods for something of a fairly definite value you merely buy a pig in a poke.

Importance of Stabilization

A MAN who is solvent has a care about issuing promissory notes because he knows he will have to redeem them, but a hopelessly insolvent man will issue promissory notes to whomever will take them. Most of the Continental nations who were at war have been living on promissory notes. A settlement of the reparations question will necessarily bring these governments back to actualities —which means they will have to cut down their expenditures to the level of their incomes and thus bring their currencies back to some moderately stabilized basis. Then, and not until then, can people go to work with any degree of confidence.

This stabilization is important to us for three reasons. First, it will bring Europe into production and give the people the power to purchase from us those necessities which we alone can supply. Second, it will remove us from unfair competition. These depreciated currencies fall hardest on the working people and the European workman today gets coolie wages. The item of labor has really been removed from Europe's goods. Third, only as Europe goes into production have we any chance of getting back any of the money we loaned, or at least some of the interest on it, and of thus reducing our own taxes, which we have to raise to pay the interest to our own bondholders on the eleven billions which is still coming to us from abroad.

That is where we come in on reparations. We are interested to just that extent and no more. The interest is large. It is not of paramount importance—not of sufficient importance, for instance, to warrant our fussing around in the affairs of Europe. By going into Europe, we can hope to get just about what anyone gets who butts into a family quarrel. The best that we can do is to suggest to the European nations some methods by which they can help themselves, and that is just what has been done by an entirely unofficial American commission composed of Charles G. Dawes, Henry P. Robinson, and Owen D. Young, all men actively engaged in American business.

Under the Versailles Treaty, the subject of reparations is lodged with the Reparations Commission, which is dominated by the French interests. This new committee, which elected General Dawes chairman, had on it representatives from England, France and Belgium. It had no authority other than to make recommendations. Their recommendations have been accepted by the Reparations Commission and have been more or less agreed to by England, France and Germany. The United States is not a party and does not have to agree. The commission's suggestions have not been fully accepted by anyone. Just now they are merely the basis of a trade and may never be accepted, in which case Europe will go on just as it is now going on until someone starts something.

The Proposed Bank

THE committee was chiefly concerned in getting something settled from a purely business point of view, that Germany might get to work and therefore that all Europe might get to work. It had no authority to arbitrate or to decide. It could not make a purely scientific report—it had to make a report which could be accepted. Otherwise its work would go for nothing. It had no authority to determine the total reparations Germany could or should pay. Nobody knows how much a nation is worth or how much money it can raise over a period of twenty or thirty years. In twenty years our own actual wealth has more than doubled. Any estimate of national wealth is at the best only a considered guess and the bulk of any national wealth is in land or mines or other property that cannot be paid over the counter.

The committee, therefore, tackled Germany as it is today. It found incidentally that the German holdings outside of Germany did not amount to much more than a billion dollars, thus puncturing the foolish notion that the Germans had fabulous sums concealed in foreign countries. The report of the committee is not precisely complicated, but it had to consider a great many factors and the report is thus not entirely easy to comprehend.

The report suggests the creation of a bank under foreign supervision which will have the sole power to issue money. The capital for this bank is to be subscribed partly in Germany and partly abroad, and although at first its bank notes will not be redeemable in gold, the bank will back them with a thirty-three per cent gold reserve and support the notes whenever their value seems to be falling. When a country has to pay more for goods imported than it receives for goods exported, its money cannot be kept stable. If Germany each year paid out a large sum on account of reparations, then the value of its money in foreign exchange would suffer. The new bank hopes to prevent this by having all German reparations payments made to the bank in marks and then the bank will make the foreign payments in some manner so as not to disturb exchange rates. Practically, this means that the actual transfer of German money for reparations will be limited to the German surplus of exports over imports.

This is the most important feature of the whole scheme, for the German financial system began to wreck itself when the government started to print paper money and with it to buy foreign exchange to pay for the excess of imports over exports. The many thousands of people who bought German marks as a speculation find these marks worthless, but they have the slight satisfaction of knowing that the proceeding also contributed largely to the wrecking of German finance. If this bank can function, then Germany can have a currency and as far as we are concerned nothing else will much matter.

Balancing the German Budget

THE other recommendations of the committee concern the gathering of reparations. The German budget has to be balanced. An insuperable obstacle to balancing the budget has been the lack of a stable money in which to calculate outgo and income. The new bank will make exact calculation possible. It will also make possible the arrangement of a scale of real taxation. Taxation will not be in phantom money. The railways and the industrial concerns of Germany are now practically debt free. They paid off their debts in depreciated currency. Twenty-five cents in real money will pay off a mortgage indebtedness of three billion marks—that is, an indebtedness which at one time represented seven hundred and fifty million dollars! It is proposed that the industries issue mortgage bonds and turn them in to the government and that the railways be separated from government control—that is, from politics—and that they issue mortgage bonds and also pay an annual transportation tax. By no means all of these bonds are to be used for reparations. Some of the funds realized from them are to go toward working capital. It is further suggested that a loan of two hundred millions be raised abroad.

In the first year Germany will pay to the bank fifty million dollars and for treaty payments at home two hundred million dollars. Most of this, it will be seen, is to be raised out of the foreign loan. In the second year the payments for reparations are to be three hundred and five millions; in the third year, three hundred millions; in the fourth year, four hundred and thirty-seven millions; and after that, six hundred and twenty-five millions a year. These sums are not inflexible. They are to be made larger or smaller according to a device known as an index of prosperity based on the amount of foreign trade, the railroad business, and the consumption and production of certain staples.

Germany, without an army and a navy, and with the whole home debt wiped out, would under the new arrangement really be paying much less for reparations than formerly she had to pay for current upkeep.

Will the Plan Work?

ON THE other hand, as has been noted in the articles on Germany, the productivity of the country is far down on the scale and working capital is almost absent. Whether a foreign loan can be raised, whether Germany will be sufficiently prosperous in five years to pay out something more than half a billion dollars a year are matters on which one man's guess is as good as another's.

Outside of the bank the other important parts of the recommendations are that the economic barriers erected by France in the Ruhr occupation be removed. The custom barriers between the Ruhr and the rest of Germany and the demoralization of the railways have been large elements in contributing to Germany's economic downfall. Also the payments are to be inclusive. At the present time the costs of the Rhine occupation, of the Reparations Commission, and countless other expenses are charged to Germany in addition to reparations. Putting these expenses into the reparations account will cut off a tremendous extravagance.

The plan, when all is said and done, is just a plan. It will not work if Germany tries to evade the payments. It will not work if France insists on mussing up her debtor's house. It will not work if the other countries of Europe refuse to receive German goods. It will work only to the degree that the people involved are tired of the nonsense which has been going on for the last five years.

When Democrats Last Met in New York

Attendant on Convention of 1868 Recalls Fervor of Post-Bellum Politics

By JULIUS MORITZEN

THE National Democratic Convention is to be held in New York in June, 1924. With an occasion like that in prospect, the memories of the "old inhabitants" are bound to stir, but it is not often possible to have the old and the new visualized, as they can be by John R. Voorhis, president of the New York Board of Elections, at the advanced age of ninety-five years. Mr. Voorhis' memories go back more than half a century when last the National Democratic Convention gathered in New York.

Old colonial New York seems to be better known than the comparatively recent time of 1868. The reason may be that the sixties are still within the ken of men now living. Fifty-five years is a short span in the life of a community.

Seated in his office atop the huge Municipal Building, Mr. Voorhis readily consented to draw back the curtain of the past and make incidents and personalities pass in review.

"When I recall with what pride we pointed in those days to the great improvements that had taken place in New York," Mr. Voorhis said, as he cast a glance through the nearest window and looked in the direction of the Battery, "I am certain that we and our visitors marvelled more at our buildings and streets then than will the thousands who come to the convention next June.

"Down at the Battery was Castle Garden, the country's once most famous concert hall—Jenny Lind sang there—now the Aquarium.

"Down Wall Street to the right, where old Trinity still points heavenward, the Morgan bank occupies the same old site, but a very different kind of building than in the days of old. The entire district has undergone a transformation."

Rising from his chair and coming closer to the window that faced City Hall Square, Mr. Voorhis pointed past the towering structure of the Woolworth Building and remarked that not much remained to signify that the Astor House was once the first-class hotel of New York.

"Speaking of hotels," said Mr. Voorhis, "I remember how they clustered in those early days around Tammany Hall, then just completed and considered one of the most magnificent buildings of its kind.

"Fourteenth street was very much uptown those days. It was still a residence district with very few stores. The Metropolitan Hotel, on the east side of Broadway between Prince and Houston streets, was considered first class; it was owned by A. T. Stewart. And there was the Prescott, on the northwest corner of Spring street and Broadway, and still another hotel on the southwest corner of Spring street, running to Broome street. There was besides, at Canal street, the Brandreth Hotel, owned by the man of Brandreth pills fame. But to stop at the old Astor House was considered the ultra-fine thing and the corner of Vesey and Barclay streets was always thronged with people coming and going."

Speaking of that pride of New York, the library at Fifth Avenue and Forty-second street, Mr. Voorhis said:

"Can you picture to yourself that in place of that magnificent public library this used to be our city reservoir? It is mighty hard to realize it, but on this busiest corner in the United States, just where this great marble library now stands, all one could see were the gray stone walls of the city reservoir. Impossible to conceive, unless you have the photographs."

"Yes," he continued, "many pleasant memories cluster around that spot. But we don't have to go back as far as 1868 to recall the country-like conditions of this neighborhood—Forty-second street was a long way out in those days."

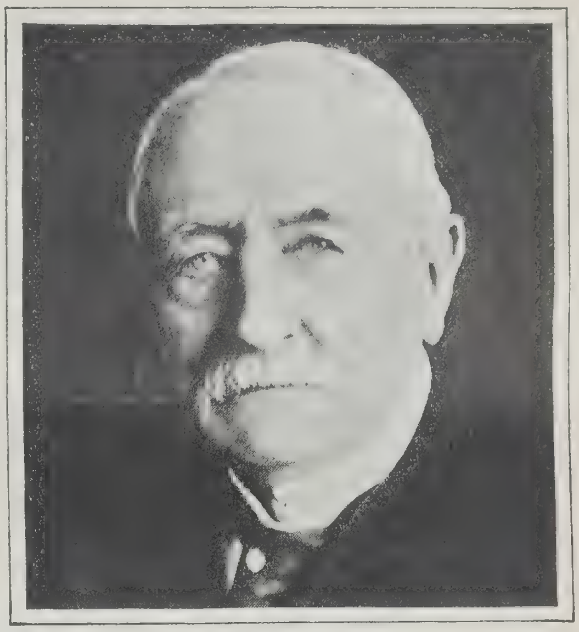
Leaving Mr. Voorhis for the present, and turning elsewhere to what may be called corroborative testimony concerning the period in question, we find that Henry Collins Brown, director of the Museum of the City of New York, tells in his "New York of Yesterday" some very interesting things about the older city.

Mr. Brown, who is also the editor of the famous *Valentine's Manual,* in speaking of his boyhood days in old New York, says:

"When we kids took an Eighth avenue car, going north of Fifty-ninth street, the conductor always said: 'Keep your nickel, Johnny, it's so good to have company up here, it's worth the money.' And no wonder! All around us was a wilderness of crags and boulders. Little wooden shanties peeped out here and there from behind occasional level spaces among the rocks. A long stepladder was needed to reach some of these eerie dwellings. Pigs and children abounded, but the chief inhabitants seemed to be goats. They were everywhere and appeared to thrive on a diet of tin cans and waste paper. This was 'Shantytown' and its inhabitants were known as 'Squatters.'

"This strange region is now covered by the Grand Central Station, the Biltmore Hotel, Park avenue and both sides of Central Park."

But to return to Mr. Voorhis: "And to think," he says, "that on this wonderfully busy avenue, with all that traffic of motor cars, grass grew in the street and the telegraph pole reared its head.



JOHN R. VOORHIS,
President, Board of Elections, City of New York.

Traffic jam on Fifth Avenue, between Fiftieth and Fifty-fifth streets. As Democrats will see it in June, 1924.

Fifth Avenue, near Fifty-fourth street—notice grass growing in sidewalk—as Democrats saw it in June, 1868.

"The days of the convention!" he suddenly exclaimed. "As you know, we were only a few years removed from the Civil War and the effect of that terrific struggle was still in the atmosphere wherever people met and discussed politics and kindred matters.

"Of course, it is hardly necessary for me to tell you that the Democratic convention nominated Horatio Seymour for President and chose Francis P. Blair, Jr., for his running mate. Seymour was a New Yorker, while Blair came from Missouri.

"It was in the week beginning with the Fourth of July, 1868. And before I forget it, and in view of the position of woman today as compared with that of fifty-five years ago, I should say that an outstanding event during the convention was the appearance of Susan B. Anthony, seated together with a score or more of women on the platform on the opening day. They handed to the chairman, Mr. Seymour, a memorial from the Women's Suffrage Association of America demanding the franchise of her sex. In parenthesis I may remark that this memorial was referred to the committee on credentials from which it never emerged."

The newspapers of the day relate that the appearance of Miss Anthony and her friends was greeted with peals of laughter and that considerable merriment met the offering of the memorial.

"I don't know how New York happened to get the convention in '68," Mr. Voorhis continued, "but I suppose it was fixed up by those in charge, just as at present. The war had been over only a few years. New York was called disloyal by some during the war and for that reason the citizens as a whole insisted on the convention coming here. There were a lot of people who thought the war should have been finished long before it was. But that is neither here nor there.

"The fact is that we got the convention for New York. Talk about decorations! Tammany Hall was a wonderful sight, decorated within and without with a mass of flags and bunting. Inside the walls were hardly visible for the decorations that covered them.

"Perhaps the crowds of that day may not look like much when compared with the jams in front of Madison Square Garden on great occasions, but I can tell you that you had to fight your way into the hall and it was a piece of good luck if you got as much as standing room. I managed to get into the gallery and had a fine view of the proceedings.

"The day that Seymour was nominated Tammany Hall was crowded to its capacity. Buses were bringing the crowds up in relays. Well-dressed men and handsomely gowned women were continually arriving in carriages—horse-drawn vehicles, of course. There weren't many single buggies in those days and the hansom cab wasn't known.

"The illuminations of that day deserve some notice—they were mostly made with candlelight. Of course, we had lamps and we had gas at the time, but it took a lot of jets to make anything like a Fourth of July celebration.

"But candles weren't such a bad thing for illumination purposes. All the windows of the houses at night were filled with rows of lighted candles, the width of the sash, and bonfires crackled and roared and blazed on the street corners. I want to tell you it was a pretty sight and the whole country knew that little old New York was proud of her company and was showing them that she was. I hope some of those old-timers who saw our city for the first time in 1868 will be here for the convention so they can see the regular nightly illumination of Broadway and ponder on what has come to pass. But the demonstration of enthusiasm in 1868 was such as New York had never before witnessed nor had the delegates and their friends from other cities and states. The memory of the sights must have long remained."

Turning for a moment to the files of the newspapers, we find the following comment on the convention:

"Yesterday, Sunday, met the National Democratic Convention. So intense was the interest of our citizens in it, that the day of all the year when New York gives itself up to the most hideous and noisy celebration was robbed of a quarter part of its exuberant homage by the deep issues and momentous questions felt to have centered in the assembling of Democrats."

Then followed an extended account of what was in

(Concluded on page 14)

Was Mexico the Cradle of the Human Race?

Traces of Five Distinct Civilizations; Partitioned Skulls

By WILLIAM L. STIDGER

Above—A corner in the studio of William Niven, showing many Mongoloid figures and designs that are manifestly Chinese in influence. On the bottom row will be seen vases and designs which can be duplicated in China at this present time. To the left on the bottom row will be seen a distinct Mongolian face.

Left—This illustration not only shows Mongolian features, but the dress is distinctly Chinese—a mandarin dress. The bulkiness of the appearance is still distinctly Chinese, as those who have traveled in China know so well. This bulkiness is due to the fact that the Chinese in winter never change their clothes. As it gets colder they put on another suit, and so on, to the end of the cold weather. This makes them look by spring about five times as large as they really are.

THE United States of America is a child in years compared with our neighbor to the south, the Mexican Republic. The oldest race of people whose footsteps we can trace in the United States were the Mound Builders, and following them came the Indians.

Mexico has five distinct civilizations, traced as accurately as if the written documents had been handed down.

The first proof of these five distinct civilizations is found in the excavations. Starting from the surface of the earth and going down, which I have seen the excavators do this past summer, each civilization is found to have written its story as clearly as if it had been written, as the Bible says, "with a pen of iron and the point of a diamond."

The second proof of these civilizations is found in the figures that adorn the pyramids, in which we find apparent the clearest possible Mongolian, Egyptian, Chaldean, Negroid, Hindu and American Indian influences.

The third proof of these distinct civilizations and influences is seen in the painted, carved and sculptored figures which are being recovered by thousands. Everywhere you dig you find these relics of an ancient people. Last July, as I was writing this article in Mexico City, a young American engineer was excavating for an iron works near Mexico City and discovered a cache of beautiful vases, idols, heads and carvings. The great steam shovel brought up invaluable gold relics at every lift. The news soon spread like wildfire and the government of Mexico sent officers posthaste to stop the excavating. This find was so rich that it is estimated by archeologists to be worth millions of pesos.

It is this way all over Mexico Valley. Plowing in the fields farmers turn up pieces of ware that are, or soon will be, worth a small fortune. Digging for foundations, jade and other precious stones, and innumerable statues and vases are lifted by the ruthless shovel. I myself have walked through the woods and fields and picked up relics of pottery and precious stones just as I used to find Indian arrowheads in the fields in my West Virginia boyhood. That is one of the fascinating things about a visit to this wonderful country; the excavations are only just in their beginnings.

The Chinese minister at Mexico City told me that everywhere he turned he could find traces of a Mongolian civilization in Mexico. I myself have traveled extensively in Mongolia and China, and in hundreds of little idols and sculptored pieces I can easily trace the Mongolian features. Every writer who writes of Mexico mentions this experience.

Mary Barton, in her book, "Impressions of Mexico," tells what we all feel and have noted:

"Everywhere I was struck by the Mongolian type of countenance among the people and by the finding of thousands of vessels with Mongolian features. This is also shown by the fact that the people themselves still have Mongolian costumes. One which I remember particularly is that of the way in which the women dress their hair. It runs down their backs in two long plaits with false hair and often shoe strings woven in. I have seen this manner of hairdressing among Thibetan women often."

This is a collection of Mongolian cups arranged about an incense burner which Mr. Niven excavated a few months ago. The figure on the top of the incense burner shows clear Egyptian traces and the faces on the legs of the burner indicate just as clear Mongolian influences.

The great pyramids of the Mexico Valley show marked Chinese influence. The dragon there has every characteristic of the Chinese dragon; a great serpent with the Mongolian head. On the great pyramids there are several of these serpents which are fifty feet long, carved of solid granite.

I have picked up out of the excavations of Professor Niven hundreds of little idols with the most apparent Mongolian features and headdress. It is as clear as if a voice had spoken out of the void of the past centuries and said, "The Chinese came to Mexico in hordes ten thousand years ago, crossing the Pacific over the Bering Straits, or coming by way of Lost Atlantis."

One thing is certain, they were here, and in great hordes, just as they are now inundating the Malay States, Java, Borneo and Sumatra. The Chinese have always been a venturing people with the pioneering instinct, and the evidence is overwhelming that they thronged this Mexican plateau ten thousand years ago in vast armies, influencing its civilization to this day.

The Egyptian influence is apparent in every shovelful of relics unearthed by the excavators, in every pyramid uncovered (and there are hundreds of them); in every piece of sculpture and every carving on every idol.

The pyramids themselves may have been built by Egyptians who came to Mexico after they had finished the pyramids of Egypt or by people who went to Egypt after they had erected the great pyramids of Mexico. The opinion has been expressed that they built the Egyptian pyramids first and then came to Mexico. The Mexican pyramids are of superior type and seem to have been built by hands that were skilled and trained in such huge construction work.

In headdress, in form, facial features and in other points, through pyramid, idol, excavations and carvings, the Egyptian influence is startlingly obvious.

That Africa also contributed its imprint to the civilizations of the Mexican plateau seems certain. In the faces of the unearthed idols, and on the carvings of the stones the Negroid influence is felt at every turn.

I was present when Professor Niven unearthed an idol that looked precisely like the American Negro.

The first civilization, indicated in chart on opposite page, was found at a depth of four to five meters. These people were the first ancestors of Mexico and were a nomadic race. In the first and deepest layer of earth the articles found are of coarse, unburnished clay. There were crude vessels without any handles or necks, as if the makers were merely imitating holes in the ground.

The second civilization is found in the second layer of earth at from three to four meters depth. It is Mongoloid in type. This layer of earth, which I myself have helped to dig through with Mr. Niven, is a mixture of wood ashes and sand. These Mongoloid remains were undoubtedly left, as we have heretofore indicated, by Chinese migrations.

Mr. L. Tao, of the Chinese legation in Mexico City, tells me that there are definite accounts in Chinese literature of this exodus of Chinese people across the Pacific about the years 2500 to 2000 B. C.

Mr. Niven unearthed some flagstones which had evidently been used for cornices in one of the temples of Texcalpan and the Chinese consul declared that they contained Chinese writings.

The third layer of earth is the most varied and the largest stratum. It is sandy soil. Here, one day when I had the honor of working with Mr. Niven, we unearthed a large flat stone floor or wall about ten feet across which had on it a perfect drawing of the sun god and the earth mother, painted in colors. It is of solid cement and has been buried at least 2,000 years. In this stratum there were also found Mongoloid figures with Mongoloid headdress and faces.

The fourth stratum, which is from two to three meters down and which is about 800 years old, contained remains of the Chichimeca or mad dogs, because they were a ferocious, naked tribe of long-faced men who tattooed themselves and who swept down from the north, armed with bows and arrows, probably our own American Indians. The Tlachichique, or the people of the third period, in fear of these ferocious mad dogs, covered up the beautiful pyramids they had built just as the Buddhists did in Java upon the invasion of the Mohammedans.

The fifth stratum, or that nearest the surface, is called the civilization of the Nahua and is found from one to two meters down. These immigrants also came from the north into Mexico. They are the present Mexican people, quiet, industrious, gentle-mannered. This civilization immediately preceded the Aztecs. Professor Niven has found the remains of a race which had partitioned skulls, unlike anything yet discovered on the face of the earth, so at least the scientists of England and America testify.

From forty to fifty natives work unceasingly, night and day, to unearth these buried cities and civilizations.

"From which of these layers of earth do the partitioned skulls come?" I asked the old Scot, who has been working passionately and ceaselessly in these buried cities for thirty years.

"From the deepest known volcanic ash strata, which means the oldest civilization that we know in Mexico."

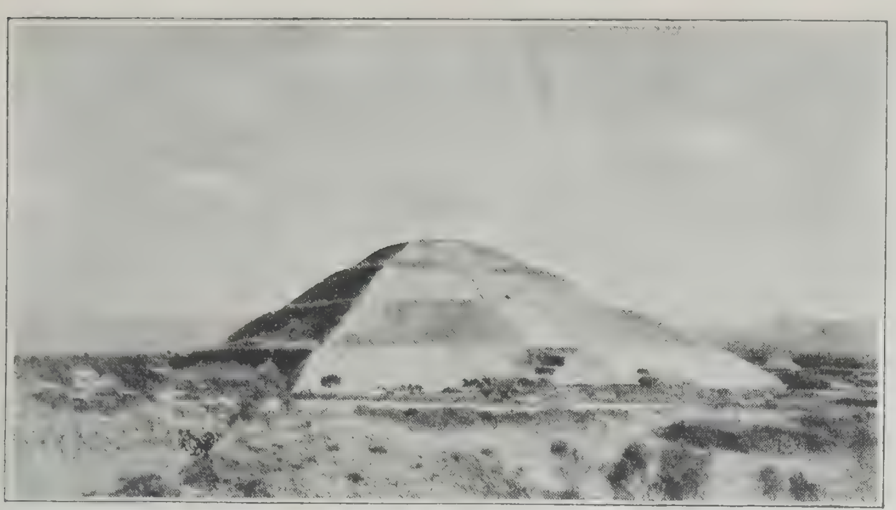
"Does that mean the oldest known civilization on earth?" I asked.

"It does. Science has not discovered a man so far back as to have a distinctly partitioned skull such as we have found here in these diggings. It means, I think, that we have discovered the oldest civilization on the earth."

Professor Niven showed these strange, partitioned skulls to Dr. Dudley Buxton, professor of human anatomy of Oxford, one of the foremost experts on prehistoric skulls in the world. Professor Buxton has in England the most complete though not the largest collection of skulls that has ever been assembled for scientific purposes. But he never saw one of these divided skulls until he came to Mexico and interviewed Professor Niven, the excavator.

"Have you ever seen partitioned skulls like these before in your collection of prehistoric man, or in your scientific investigations?" Professor Niven asked Dr. Dudley Buxton.

"No! Never so pronounced as these. We have



Pyramid of the Sun.

found them with a slight suggestion of a partition, which might have been due to some sort of headdress or pressure put on them when they were children."

"But would any external pressure, even during the plastic state of childhood, bring about such a marked partition as you see in these adult skulls?" asked Professor Niven.

"Impossible, I should say," replied the great authority.

These skulls are of normal adult size. They have a distinct partition of hard bone, running from the under surface of the skull inward, thick at the skull and tapering to a fine point the farther in toward the brain matter it extends. Some of these partitions are as much as three-quarters of an inch deep, marked and distinct and hard as bone can grow.

This protuberance is back of, and inside of the frontal bone, running almost to the junction of the frontal and the parietal bones, dividing the skull into two partitions as clearly as a room is divided by a partition of wood.

"How many of these have you unearthed?" I asked Professor Niven.

"Several hundred, and we are finding them every day."

"Is there any other marked difference between the skulls of these prehistoric men and the skulls of men of our present civilization?" I asked.

"Yes."

"What is it?"

"There is a separate piece of bone or skull which looks like trepanning (but is not, according to Dr. Buxton). This piece of round skull runs, like a large-sized coin, the dimensions of a silver half-dollar, between the parietal and occipital bones. It seems natural and is found in all of these skulls which have also the partition. This is not found in our present skull structure," explained Professor Niven.

Dr. Buxton measured these skulls carefully, took the measurements to Oxford and will report the results of his findings.

"Can you picture these strange people with their flesh on them?" Professor Niven asked the scientist.

"My specialty has been the study of skulls and I can see these people alive and dressed in their flesh just as distinctly as I can see you standing there with that skull in your hand," replied the Oxford savant.

"What did they look like?"

"Savages! They were wild savages!" said Dr. Buxton.

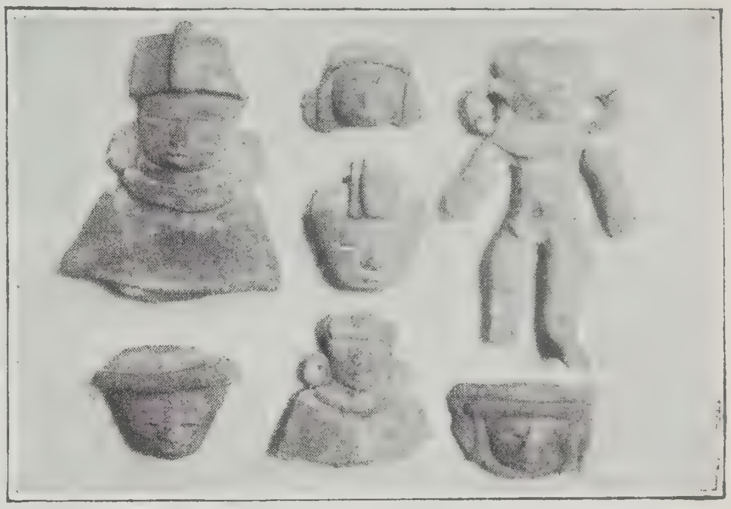
"Wrong!" responded Professor Niven, with a great deal of feeling back of his kindly Scotch smile. "These people with divided skulls are the people who built the greatest pyramids on this earth—larger than the Pyramids of Cheops and more beautiful. These people who had the divided skulls developed a high type of culture two thousand years before Christ came to the earth.

They were astronomers and they made observations on these pyramids for thousands of years. Their wise men night and day studied the stars, without astronomical instruments of any kind. They made calculations and lost only one day in fifty-two years which was their century.

"And more than that, in this respect, I would like to call your attention to the fact that these astronomers, without instruments of any kind, were superior to the astronomers who made the Julian calculations, for the Julian calendar is short one day in four years, which is the leap-year loss. These ancient men of Mexico lost only one day in fifty-two years—or one day in what is their cycle of years corresponding to our century."

Professor Niven immediately shipped some of these skulls to Oxford. He had a strange experience in getting them out of Mexico.

Excavators in Mexico consider this discovery of Professor Niven's the most important that has been made. The old archeologist himself, who has been digging for thirty years, says that this unearthing of a race with partitioned skulls is his greatest contribution to scientific discovery.



Group of Mongoloid gods, including sun god, fire god, earth god and water god.

Professor Niven has given me permission to publish a printed chart he has evolved to illustrate these five distinct civilizations. These civilizations succeed each other, as shown by the chart.

Archeological Objects
Collected by William Niven,
From Excavations in Buried Cities Beneath the Valley of Mexico,
Illustrating the Ancient Races of America

CIVILIZATION	DEPTH	LOCALITY
Toachtopayotlaca 5000 B. C.	4 to 5 meters	Tlatelco, near Azcapotzalco.-D. F.
Mongoloide 2500 B. C.	3 to 4 meters	Tlatelco and Amantla, near Azc.-D. F.
Tlachichique [the makers of all things] 2000 B. C.	2.50 to 3 meters	Ahuizoctla, Xometitla Amantla and Tlatelco near Azc.-D. F.
Chichimeca [Mad dogs] 800 A. D.	2 to 3 meters	Tlatelco, Ahuizoctla, Amantla, Xometitla and Tlilhuaca.-D. F.
Nahua 1200 A. D.	0. to 2 meters	Same localities as above.

A Libel on Scotsmen

It's No to Get the Joke in, But the Humor Out, That an Operation Is Required on a Scotsman

By VICTOR MITCHELL

IT HAS been said that all the peoples of the earth weep in the same language, but laugh in different languages. When one thinks this over, it seems to be true. A Frenchman will laugh at something which will leave a Scandinavian cold. An American will become hilarious over a joke which will make no humorous appeal to an Englishman.

As for a Scotsman, Sydney Smith is alleged to have said that it required a surgical operation to get a joke into the head of a Scotsman, and this gibe at the Scottish race has been extensively quoted ever since.

But the truth of the matter is that no such statement was ever made by Sidney Smith.

The correct version is recorded by Dr. William Chambers, of Edinburgh, the founder of *Chambers' Journal*. Dr. Chambers said to Sydney Smith that he must, at least, admit that the Scots were a humorous race, and the English man of letters replied:

"Oh, by all means, you are an immensely funny people, but you need a little operating upon to let the fun out. I know of no instrument so effectual for the purpose as the corkscrew."

Strange to say, the fire of English wit is largely directed at the people of Aberdeen. For example, it is stated that an Aberdonian was taking a walk with his young son when he said:

"Jock, is that yer Sunday boots ye've on?"

"Ay."

"Weel, then, tak' longer steps."

There is also the story about the Jew who went to Aberdeen and filled in his census paper with the declaration that he had gone there *"to learn his profession"*; or the one about the Aberdeen fish-dealer who said that as he had to buy his fish from Scotsmen and sell them to Jews, he could "mak' naething o't."

Even the dumb animals from the Granite City are alleged to be endowed with this keenness of eye for the main chance, as witness that story about the Aberdeen horse that came to a sudden standstill on the streets of Glasgow and would not move until they lifted up his hoof and found a "saxpence" underneath.

The Archbishop of Canterbury is an eminent Scot, and this is one of his stories:

"A Scotsman got a position in a large commercial house in London, and a friend, meeting him shortly afterward, asked: 'Well, how are you liking England?' 'All right,' he replied.

"'But how do you like the English?'

"'Oh, weel,' said the Scot, 'I havna met many o' the English yet. Ye see, a' my dealings are wi' heads o' departments.'"

Much Scottish humor that is peculiarly characteristic circles round the minister, the beadle or sexton, and the simple folk of the country districts.

A parish minister one Sunday was reproving his congregation for sleeping in church during the sermon. He said:

"Look at Jamie Fleeman, the parish fool; he's wide awake."

"Ay, and if I hadna been a fool I would hae been sleepin' too," responded Jamie, loud enough for everyone to hear.

On another occasion, in the wintertime when the weather was cold and stormy and the church without any system of heating, the minister was preaching an unusually long and dry sermon. The members of the small congregation rose one after another, left their pews and quietly went home, until the beadle became the only auditor. That official waited patiently for a time, but the sermon went on until he could stand it no longer. So he slowly and noiselessly ascended the steps of the pulpit, and taking the key to the church out of his pocket he held it in front of the preacher, remarking in a subdued tone: "If ye please, sir, when ye're done, would ye be sae kind as to lock the door?"

The beadle or church officer is in Scotland—especially in the country districts—a greatly privileged person, and is often a bit of a character. A young university student, fresh off the irons, visited his native parish and met the beadle, who had a high opinion of his minister. The student said he heard the minister's sermon, but that the simile of the wind upon the barley which had been used was borrowed from the "Odyssey" of Homer. "Dinna tell me that," retorted the beadle. "I believe it's mair likely Homer borrowed it frae oor man."

Earl Balfour said recently that philosophy was not so popular in any country as in Scotland. But some of the folks are philosophers without knowing it, as the following instance will show: The minister and his man Jeames were driving past a Highland distillery. The tall chimney was considerably off the perpendicular and the minister said: "If that stack falls it will kill somebody."

Jeams immediately replied: "It'll kill mair folk if it stan's."

Then there is the story of the fellow, supposed to be half-witted, who was one day walking through the Earl of Eglintoun's private grounds. The earl saw him and called:

"Come back, you're on the wrong road."

The man stood still and said: "D'ye ken whaur I'm gaun?"

"No," said the earl.

"Then how in the world can ye tell whether I'm gaun the richt road or no?"

And he walked on.

Not so very long ago there lived an old Highland minister whose homely remarks occasionally drew a smile from even the most serious-minded of his congregation. One day he paused before beginning his sermon and called out:

"There's a young man there ticklin' a young woman, in the gallery; when he stops I'll begin!"

The same minister, preaching a sermon on "Faith," made use of the following illustration from his own experience: "I was coming over in the ferryboat from Cromarty to Invergordon, and a storm arose. The boat gave a big lurch and a young woman sitting near me gave a scream and just gripped me round the middle. My friend, that's faith."

In a fishing town in the North of Scotland an old

(*Concluded on page 12*)

The Sources of America's Individualism

Many Nations, of One Racial Stock, Mingle to Form the Soil of Liberty

By ALBERT ERNEST JENKS

FROM the midst of our national existence, Emerson, "the apostle of self-reliance," expressed the meaning of American individualism:

> "We will walk on our own feet;
> We will work with our own hands;
> We will speak our own minds."

The dictionary defines individualism as "personal independence of action, character or interest." We may vitalize that definition in the words of Aunt Lydia, the sturdy mountain woman of the Great Smokies in Eastern Tennessee, who, having lived her eighty-five years in stern battle with the realities of life, said to me, "I don't aim to do as nobody says. I aim to do just as I please." Individualism rests on the principle that a man shall be his own master.

The individualism of the American people is not a thing of chance. It has had three chief sources which have made it a dominant characteristic of our nation. These sources are: First, the enduring fact of race which has been so potent throughout our existence; second, the process of selection which has been ceaselessly operative during the continuous immigration of peoples to America; and third, the gripping, undying hold of the American environment.

The modern individualistic ideal of government—of industry, of property right, of education, of religious ideas and practices, and of almost every other human activity "of, by, and for the people"—is such an everyday conception with us in America that we can afford to have its early sources brought again to our view.

Early Beginnings

AMERICAN individualism has been constantly fed by the fact of race. Different races have made different contributions to the culture of the world. The roots of American individualism are fast imbedded in a race of men believed to have entered Europe near the close of the Paleolithic age—something like 15,000 years ago. They were then clustered about the Baltic Sea, and apparently were the ancestors of the present Norwegians, Swedes, Danes, Northern Germans, Austrian Germans, Dutch, Flemish Belgians, the Norman French, and the Anglo-Saxon Britishers.

The outstanding psychic characteristic of this Baltic race and of their descendants wherever found is individualism—their emphasis on the worth and rights of the individual. The germinal contributions to the gradual development of individual liberty were made in pre-Christian days. With the acceptance of Christianity came the dynamic backing of the Bible to drive forward this innate racial conception of the individual. Thenceforth the typical individual of this northern race and culture has continued to fight against organizations which would hamper and control him. At the same time, a most important fact to note, he has struggled to build up organizations which would safeguard and protect him in the opportunity for greater individual expression.

An early expression of this spirit on the Continent of Europe was exemplified by the Frisians, in whom the sense of individual liberty was especially fostered and matured. "The Frisians," said their statute books, "shall be free as long as the wind blows out of the clouds, and the world stands." It was from this area of old Frisia that the Angles, Danes, Frisians, Jutes and Saxons, and other tribes, crossed the waters from the Continent to England where, in time, they produced the Anglo-Saxon race and culture.

A later Continental expression of the worth of the individual was the birth of the so-called "Dutch Republic," which came into being in 1579. For two hundred years this republic was the glory of Europe, leading all other states in learned men, universities, manufacturing, shipping, discovery by sea, painting, domestic architecture, home life, and, for the purpose of our present study, offering practically the only haven of liberty then in the world for oppressed mankind.

Across the English Channel the individualistic spirit of the peoples who had been transplanted from the Continent was working as a leaven in a continuous struggle for religious and political freedom. It was during the reign of James I, in 1608, that a group who had separated from the Church of England and were thus called Separatists, fled from the persecution of the established church in England to Holland. "In Holland these Englishmen imbibed anew republican ideas and caught anew the spirit of liberty." In 1620 these Separatists, who later were called Pilgrims, left Holland and sailed for America, stopping long enough in England to get a few recruits. Thus began the great migration to the New World of those persons whose unyielding individualism would not die.

The movement for political freedom in England was crystallized in the early part of the seventeenth century under the name of Puritanism. Puritanism was rank individualism fighting for greater freedom of expression in religion, in government and in private life. At the height of its struggle for political liberty, Puritanism was transplanted to America. The Puritans in England turned their eyes toward America, where their friends, the Pilgrims, were. "Endicott went to Salem in 1628, with forty or fifty persons; 400 came with Higginson in 1629; 800 arrived with Governor Winthrop in 1630. Up to the time of the meeting of the Long Parliament, in 1640, the average number of emigrating Puritans was about 2,000 a year."

Thus we have the deep racial tap root of American individualism—a racial feeling of individual dignity and worth in the Baltic race best preserved in Northwestern Europe, carried across the channel to the British Islands and finally transplanted from England to America.

ALBERT ERNEST JENKS

Besides being professor of Anthropology at the University of Minnesota, Dr. Jenks is a member of the National Research Council, Washington, D. C., and chairman of the Division of Anthropology and Psychology. He is a distinguished lecturer in summer courses on foreign races in America. Dr. Jenks' administrative experience also is large, including such posts as Chief of the Bureau of American Ethnology, Smithsonian Institution, Chief of the Bureau of Non-Christian Tribes in the Philippine Islands, and Associate Editor of the *American Journal of Physical Anthropology*. His keen observation and analysis are only equaled by the breadth of the sympathy which he brings to his important field.

From the time of the early colonization of America up to about forty years ago the large majority of the people who came to America came from the northern areas of Europe. They were a people who did not need to cluster in social groups in our cities, but dared to go as individuals or families to the distant farms and the lonely frontiers to make America.

The second source of American individualism is the factor of selection—we may properly say immigrant selection—which has operated ceaselessly among all groups of European peoples from whom our early colonists and later "immigrants" came to America.

Migration is one of the best examples of the human selective process revealed by universal history. It may be stated as an ethnic law that, other things being equal, it is the most restless and highly vitalized, the strongest and most courageous, the most dominant and individualistic persons who in the spirit of adventure and conquest go farthest from the home nest.

The selective process has thus normally brought to America men and women of strong physical energy, clear vision and judgment, and dominant wills. The weaker stayed at home.

The Lure of America

THOUGH our recent immigrants are racially different from those coming earlier, unquestionably these later immigrants are among the most individualistic members of their several races. The lure of America to the immigrant has been the lure of independence—religious, political, social, and economic.

Today it is a question whether, due to the spirit of the times, the selective process is not bringing us a greater proportion of rank individualists than ever before.

The names of leaders in the numerous activities against legalized American procedure reveal a surprisingly large number of members of our newer immigrant races. Right or wrong they are the men who dare to differ. During several years of rather close observation of our newer immigrants it is their individualistic expression, as well as their herding practice, which forces itself on my notice. Each man is strongly inclined to talk about his "rights" as an individual. Often he seems to have come to America with an individual-rights chip on each shoulder.

The third source of American individualism is the American environment—really our frontier environment. Our historians have made it clear that the westward movement is the characteristic American movement. From the long line of the Atlantic seaboard westward in America there was ever a slowly advancing frontier line, with its new problems for the isolated frontiersman.

Never before had civilized men encountered such vast and impenetrable forests, such lonely and limitless prairies, and such cruel deserts. Everywhere, in it all, those adventurous men and women had to pit their physical endurance, their courage, their frontier craft, their cunning and invention with that of the most individualistic, and, in all probability, the most splendid specimens of native races that history has recorded. Boone and Crocket are not the only isolated men whose woodscraft proved superior to that of the forest Indian; they are only two of the men from among many thousands in America's historic pageant whose resourcefulness became greater than that of the Indians who had been forest-bred for centuries. Buffalo Bill and Crawford are not the only isolated plainsmen who became more capable than the Dakota, the Pawnee, the Cheyenne and the other Indians of the Great Plains; there were hundreds of plainsmen who outwitted the horse-trained Indians.

The Genius of the Pioneer

FIRST, the frontier line was drawn by the hunter and trapper, then by the prospector and miner, the herder and homesteader, and at last by the sedentary farmer. Each took his stand alone. He was miles, days, and even weeks distant from his neighbors. The American environment, with the native Indian, reacted on the self-reliant and resourceful men and women of the sons and daughters of those northern peoples from Europe until "Yankee ingenuity" was proverbial, and the frontier American became a "Jack-of-all-trades."

Harriet Martineau wrote of the American in our eastern forests nearly one hundred years ago: "The settler, carrying merely his axe, makes his very tools, his house, his fireplace, his bed, his table; carves out his fields, catches from among wild or strayed (maverick) animals his farm stock, and creates his own food, warmth, and winter light."

We may note that life in a frontier environment has always tended to produce resourceful individuals. The Stouts wrote in 1911 of the New Zealander: "There is an adaptability in a colonial that is often absent in his home-reared brother. A colonist is able 'to turn his hand,' as it is said, to anything. His occupation, especially in the early days, changed often. He is more resourceful, and has more initiative than one brought up in Europe, and he seems to get on better among Americans than the Englishman seems to be able to do."

American frontier influence has been continuous from our earliest Atlantic settlements until today. Today it is not ended. Frontier life is still being characteristically lived, in large part, by thousands of homesteaders in most of our states. In the aggregate, it is the daily life of many thousand isolated prospectors, ranchers, herders, farmers and even townsmen scattered throughout the vast American domain.

The outstanding individualism which characterized our people at the time of the founding of our nation is well shown in the following extract from a letter of Washington to the Governor of Virginia concerning the action of men in the army at the time of the Revolutionary War. Washington wrote: "Every individual has his own crude notions of things and must undertake to direct. If his advice is neglected, he thinks himself slighted, abused, or injured; and to redress his wrongs, will depart for home."

Amusing as this account is to us, it was but the direct expression of the resourceful individualism of the men of the frontier. It had undoubtedly been necessary for many of these men of Washington's army to think and act largely for himself in frontier warfare.

The early American spirit of individualism expressed itself in one of the highest conceptions of genuine democracy ever uttered by America when Washington defined his governmental policy. "I wish well to all nations and to all men. My politics are plain and simple. I think every nation has a right to establish that form of government under which it conceives it may live most happily; provided it infracts no right, or is not dangerous to others; and that no governments ought to interfere with the internal concerns of another, except for the security of what is due to themselves."

No well-known early American better illustrates the belief in thorough individualism than does Jefferson. "No man has a natural right to commit aggression on the equal rights of another," said Jefferson; "and," he added, "this is all from which the laws ought to restrain him."

In his first inaugural address as the third President of the United States, in concluding his statement of what our government should work for, Jefferson added: "One thing more, fellow citizens, a wise and frugal government, which shall restrain men from injuring one another shall leave them otherwise free to regulate their own pursuits and improvements."

Jefferson was a product of the then western frontier, and he was left, at the age of fourteen years (as he says), "without a relative or friend qualified to guide" him. The value he placed on resourcefulness as a desirable individual quality, and as a national characteristic, is strongly emphasized in his advice to his daughter. She complained that she could not translate her Livy without the aid of her master. "If you always lean on your master," her father wrote her, "you will never be able to proceed without him. It is part of the American character to consider nothing as desperate, to surmount every difficulty by resolution and contrivance."

(This is the first part of an article which will be completed in our next issue.)

Mr. Ford's Page

THE sea is wholesome because it is constantly in motion, and human society is saved from utter decay by the permanent principle of change. Where the initiative of change dwells is a disputed point. Does human society move forward of its own will, or is it pushed?—that is the question. In a group of men there will be some that have initiative, they are the self-starters, they have a hidden spring of action in themselves; but others will be lethargic, standing still until they are told to go, moving only when circumstances push them.

Whether in the counterbalance of these two kinds of human nature we find the motion and balance of human society, is a further question, which, perhaps, cannot be resolved. For to search for the source of human initiative is to search for the source of life.

However there *is* change, society *is* moved along, and it is often worth while to classify the accompaniments of the process.

It will be agreed, when it is sufficiently considered, that the conditions most complained about today were at one time hailed as wonderful improvements. Range through the whole field of complaints and see how true this is. Everything that we are now agreed upon as being undesirable was at one time the very height of desirability. It constituted such a notable advance on what had preceded it that its appearance was greeted as a triumph.

FOUR steps make up the ladder of progress, each a stage of power. The first is fault-finding, capacity to react to the feeling of wrong. It is not infallible, the wrong may be in the finder rather than in what he deems the fault. Second comes analysis, power to take a situation apart and lay the facts bare. This is of higher order than the first, is less self-centered, less emotional. Then comes the power of criticism, which means to weigh values, to value all facts according to universal standards. Fault-finding is emotional; analysis is intellectual; criticism is moral. Fourth and last is creativeness, the full flower of human usefulness when connected with the invisible sources of knowledge and suggestion. At the foot of this ladder are multitudes. Higher, the climbers grow fewer. Imagine what Progress will be when the higher ranges of the ladder swarm with the Servants of Service!

What has caused this change in attitude? It is attributed by some to the growing mental stature of the race. To others it is merely an illustration of the old saying that if you give human beings an inch of favor they will demand a yard. In any case, the fact remains that the best slowly loses its status until it comes to be regarded as very like the worst. We are complaining today about conditions which kings could not have commanded in the days of our great-grandfathers.

This, however, is not said here to introduce the preachment that men should be satisfied. It merely introduces a casual study of the phases in which men's dissatisfaction manifests itself. The mind-action which accompanies social dissatisfaction, or any discontent which is the harbinger of progress, may be considered under three descriptions: first, fault-finding; second, analysis; third, criticism.

Fault-finding is the most elementary reaction to the sense of wrong conditions. It may be wordless as an infant's cry in the night, but it may still be the language of protest wrung out under pain. Or, on the other hand, it may be the whimper of a pampered race whose dainties have become scarce or harder to get, the plaint of a soft people resentful of the need for hardihood. In any case, it is the first crude reaction to the pressure of conditions. It may be valuable as a symptom only, it is never a diagnosis.

Send a man into the coal fields to find the cause of the trouble and he will be met with a condition of fault-finding to which in the majority of cases he himself will succumb. According to his bias, he will emerge from his investigation shouting the faults of the mine operators or shouting the faults of the miners. The fact that faults are to be found on both sides and in almost equal degree, rather weakens his findings. And the further discovery that these faults in which both sides share are themselves the result of a general condition that embraces them both, renders the whole service of fault-finding at an end.

For when we have risen above the heat and the dust of partisan conflict and have found the general conditions involved, we enter the region of *analysis*. It is here that people part company, the great majority satisfied with fault-finding, the small minority wholly unsatisfied until they find the causes of the faults which are complained of. For one person whose mind requires that the work of analysis be done, there are tens of thousands who are satisfied with mere fault-finding. The easiest road to temporary public favor is to share the grudges of the majority and shout them louder than the rest, with new embellishments. This is the method of the demagogue.

It is amazing to observe how large a percentage of our intelligent classes desire to remain in the region of fault-finding simply because effort is required to rise into the region of analysis. Lazy-mindedness is a disease which drives the mind to lean on any convenient defect that may serve as an excuse in lieu of a reason. To express and nurse the grievance, instead of diagnosing it, is the first tendency of human nature with regard to unpleasant or baffling conditions. It is the tariff, or it is the Republicans, or it is the Eighteenth Amendment, or it is the capitalist, or the workingman—anything handy will do on which to lay the blame.

Such a course discovers nothing, solves nothing, improves nothing. It is emotional rather than reasonable, whimpering rather than self-reliant; it encourages moral cowardice. And the habit of looking around for someone to take the blame is parent of the habit of looking around for someone to help us, instead of looking to ourselves. Both these habits arise from weakness, from the general human willingness to coddle ourselves, and become willing prey of false leaders who promise to coddle us.

We need analysis more than fault-finding, for then we face conditions and not merely people who are caught in the very conditions which we charge them with creating. From analysis the way is made clear to go on to *criticism*. It is a sad light on our mental habits that the very word *criticism* has come to mean fault-finding. It has nothing to do with faults or excellences as such, it has only to do with values. When a situation is analyzed, all its elements are laid bare, as when the symptoms of a disease are tabulated and the history of the patient taken, or as when a machine is taken apart to repair a defect. We have any amount of fault-finding with regard to the coal situation, the farmers' situation, the reparations situation, but little real analysis. The facts are not all laid bare.

In the work of criticism, a judgment is given on the various facts which analysis produces. The facts which are productive of disharmony, waste, injustice are so valued; the facts which favor use, efficiency, general service and welfare are so valued. The critic separates between the good and the bad, the wise and the selfish, the permanent and the temporary. Progress in social welfare is not a matter of one group getting the better of another by any method such as getting laws passed, or parties elected, or programs accepted. The forcing of one set of facts into control of another set of facts does not mend a wrong condition as long as in the total facts there are those that make for wrongness. True criticism, which means fairness and detachment of mind, requires that from all the facts there be eliminated those which are productive of the qualities which hurt men and prevent social progress.

The analyst is not very popular, because he takes apart the interior mechanism of a condition, and as neither side to a controversy possesses all the virtue nor all the vice, the analysis necessarily exposes the sins of each. And the true critic is even less popular, because by the same law he judges both.

And yet it is by these two, goaded into action it may be by the insistent murmurings of the fault-finders, that we get the material by which consciously to direct our economic courses toward justice. Millions of fault-finders, hundreds of analysts, tens of critics—this is the ratio which we ought to mend, becoming fact-finders and value-finders in ever-increasing numbers.

A volume of 452 pages, durably bound, containing 98 of these articles under the title of "Ford Ideals," will be sent postpaid for $1.00.

Scientific and Kind

IN EXPRESSING their views on immigration the Bishops of the Methodist Episcopal Church in quadrennial conference assembled, have said nothing new, but what they have said is phrased with singular clarity. They are looking to a solution of the problem that shall be at once "scientific in its methods and Christian in its spirit," and while they do not presume to say what that desirable method would be, they do say that it cannot be scientific and Christian unless it does four things:

Provide for a selective process in the countries of origin, thus preventing the cruelty of rejection after reaching an American port.

Wise distribution of those immigrants who are accepted.

The prevention of the exploitation of these newly arrived people by unscrupulous profiteers.

Placing at the service of these prospective citizens every constructive agency that makes for an intelligent, patriotic and American citizenship.

These are excellent guide posts. The first can be easily arranged by Congress. The second can be achieved by co-operative action between Federal and State governments and private societies. The government will find that most of the immigrants arriving possess organized loyalties with which our Government would probably decide not to interfere. The third suggestion is hardest of all to meet, since the exploiters of the newcomers are usually of their own race. As to the fourth suggestion, Americanization work made a good start but a poor finish. As practiced now it means Americanism as seen from any one of a hundred racial and religious angles.

Nevertheless, the main objectives of the Bishops will command the agreement of all, for the principle in each of them is fairness to the stranger.

Doctor Butler, Tinker

FORTUNATELY, what Nicholas Murray Butler may say, while usually interesting, is not of world-toppling importance. This is regrettable, for time was in this country when presidents of great universities were able to speak the people's thought in a way to give that thought incisive power. The nation's spokesmen are not found in the seats of learning today; indeed we look for them in vain in all the seats where our fathers were accustomed to find them. A strange puerility has fallen upon pulpit, academy and legislative forum. All of them make efforts to be heard; they resort to many devices to attract attention, but the root of the matter is not in them, and the people turn away unrefreshed.

It should be said in President Butler's behalf, however, that he labors under a great handicap—he lives in New York. We have heard of Americans who were so impressed by the London point of view that they quite forgot their Americanism; but it is daily evident that infection by the New York point of view produces the same malady. Nicholas Murray Butler resides among what is probably the greatest aggregation of alien-minded aliens existing on earth, and what is worse he daily mingles his mind with theirs in his capacity of head of the world's greatest alien university. Very few things American are in favor among the community where Dr. Butler dwells. The Constitution itself, even before the Eighteenth Amendment was added, was very much out of favor. Americanism generally is an influence to be neutralized—in the mind of the great majority of Columbia's alien beneficiaries. And nothing would better serve their end than to have the Constitution not only unwisely amended, but un-amended again and again, until that Document becomes a mere scrap of paper.

As to the question of Prohibition we take it that Dr. Butler is estopped by his environment from thinking about it as the majority of the American people do. Residence in New York or Washington is separation from the mind of the United States. The Prohibition discussion now proceeding should have occurred before the Constitutional amendment was made. What had Dr. Butler to say then? But now that Prohibition is in the Constitution, it will stay there if for no other reason than to warn everyone that the foundation Document of this Government is not to be juggled with—now jammed with amendments, now denuded of them, and made the sport of passing interest. Dr. Butler has perfect liberty under the Constitution to think as he pleases, and even to say what he pleases, about Prohibition. But tampering with the Constitution is another matter.

However, it would be a mistake to grow too serious about this. Dr. Butler is usually harmless.

How the Loan Works

THE significance of international banker control of the destinies of countries is illustrated in the remarkable terms of the four hundred million lire loan the Banca Commerciale Italiana has recently extended to the Polish Republic.

The loan is secured by a first lien on all the fiscal revenues arising from the Tobacco Monopoly in Poland and runs for twenty years. The price of issue to the public is eighty-seven and the rate of interest seven per cent, a terrific burden to the borrower.

The Italian Government has given the bondholders a subsidiary guaranty to the effect that if the Polish Government by reason of armed invasion is unable to meet interest on the bonds at any time, then the Italian Government will substitute its own liability.

It is provided that in this event the Italian flag will be raised on all properties of the Polish Tobacco Monopoly in Poland which will come immediately under the protection of the Italian Government. Thus thousands of Italian conscripts may be slaughtered in Poland or other theaters of war, and the Italian taxpayer loaded with greater burdens, in order to fulfill the international bankers' contract.

However, this loan has the virtue of putting into plain words the real intent of all these international banker loans where the politicians have been brought into collusion with the money lenders.

The bulk of the people in this country do not realize the extent of the European practice of international bankers bringing the various leaders of political parties under their control for the furtherance of these unholy deals. The politicians, even the most eminent, are reached either through outright bribery or by assistance in profitable speculation.

The maneuvers to get American bankers with international alliances to place reparations bonds with the public have in mind that this will ultimately bind our government to countenance the deals which bankers of France, Germany, Holland and elsewhere are making at the expense of the working people of Europe who will sweat for generations to satisfy their new masters. What could not be accomplished politically with America may be done by the bankers.

Cutting the Knot

THE Reading *Eagle,* a daily newspaper published in Reading, Berks County, Pennsylvania, has disposed of the editorial policy problem by omitting editorials from the paper.

This smacks of the sound common sense that is a characteristic of the Pennsylvania-Dutch of which Reading is a capital. Reading is not a small town, its population is 108,000, the county has a population of 200,000, and the daily average circulation of the *Eagle* in March was 42,924.

There are too many censors upon the present-day newspaper editorial and the result is a non-committal output which by no means pleases anybody, but has the superior merit of offending nobody.

The local department stores, the national advertising agencies who have policies of certain clients to enforce, and the banks' advertising, all play havoc with the supposedly free press. Then the editor has to please the local political groups and be careful not to interfere with the social and political ambitions of the publisher or owner of the paper.

In such a situation, it may be just as well to abolish the editorial page as a fixed institution, and revive it only upon those occasions when strong and honest convictions can be no longer repressed.

Why Not in the White House?

"I NEVER knew a President who was happy after he got into the White House," says former Vice-President Marshall.

It all depends on what he means by happiness, and what Presidents he has known.

Mr. Roosevelt said he had enjoyed a "bully time" during his Presidency, but doubtless it took out of him more than he would ever admit.

Mr. Taft probably had an unpleasant enough time of it, because Mr. Taft was so seldom master of the job, so constantly at the mercy of advisors, and so unluckily doing the wrong things.

Mr. Wilson, physically weaker than all the recent Presidents, rose to the weighty duties which came with the war, and by wise management of his time and economy of effort, got through an amount of work which made even Roosevelt's most strenuous days look rather leisurely. Mr. Wilson was never more fit than at the height of the war. He was not frittering away his strength in trying to keep pace with the frivolous fringe of Presidential life, and it may be said that he left for the Conference of Versailles in better physical condition than he left Princeton to enter the White House.

What pulled Mr. Wilson down was the social pace which was set up for him especially in Paris, added to the increasing mental irritation caused by his totally new experience of dealing with supposedly responsible statesmen whose word did not keep good overnight.

The attempt at Woodrow Wilson's age to adjust the mind to a wholly uncertain world of moral concepts is bound to be debilitating, and had he acted on his last strong uprush of American independence and taken the ship home the day he threatened to do so, the history of the past six years might have been vastly different. It was not the Presidency that killed Wilson. It was the useless frills and insincerity of European diplomacy.

Still, happiness should not be a stranger to the White House. There's a man's work there, and when there's a man to do it, that should spell satisfaction.

Of course, when a man vainly straddles between six or seven impossible parties, makes himself politician-in-chief, job-dispenser-in-chief, national-handshaker, non-emptiable-source-of-oratory, together with all the legitimate and constitutional things a President must be, the mixture may easily become a little nerve-racking.

We venture to think that the present occupant of the White House is neither unhappy nor suffering in his health.

In the language of a profane but expressive saying of the street, what we want is a President who lives every day so that he can look any man in the eye and tell him to go to the devil.

The Bias of the Tongue

THIS is worth considering, as are most of the ideas of L. P. Jacks, of the Hibbert *Journal*:

"Judging the importance of things by the degree in which they lend themselves to public contentiousness, a standard of values peculiar to the parliamentary age, we inevitably give to evil a prominence to which it is not really entitled. For there is more to be *said* about evil things than there is about good things, more about vice than about virtue; more about sickness than about health . . . .

"The vocabulary of blame is wider than the vocabulary of praise; its terms are more easily found, and the habit of using them more rapidly acquired; while fear (the mother of accusation) is more voluble than courage, which is, on the whole, a very silent quality and indistinguishable, in its higher manifestations, from love.

"If you cultivate the eloquence of blame the scope of your indictment will expend without limit; the more you say the more will remain to be said, and you may go on making speeches forever. But if (like St. Francis) you cultivate the eloquence of praise you will be met at every stage of your progress by a law of Diminishing Returns. As you pass from the evil to the good, from the good to the better, from the better to the best, you will find it continually harder to do justice to your theme; the satisfaction of 'hitting the mark,' so easily found when abuses are being exposed or lies nailed to the counter, will now be increasingly difficult to find; the area of discourse will contract, its values acquiring an intensity which language cannot overtake; you will have less and less to say, until, at last, when you come to the Very Best you will be struck completely dumb and have nothing to say at all. The Very Best is no theme for oratory.

"The bias of the tongue being always in the direction of indictment it is easy to understand how the habit has arisen of interpreting our social system in terms of the evil rather than of the good . . . ."

A College Where Old-Fashioned Virtues Reign

Youth of Taylor Respond to the Call for Old American Standards in Conduct and Education

By JOHN PAUL
PRESIDENT OF TAYLOR UNIVERSITY

Interior view of the greenhouse.

A typical scene on the pasture lands.

This is the story of a small American college, seventy-two years old, which is attempting, with apparent success, to conduct a school where the old-fashioned virtues reign. For example, there is no smoking there. The co-ed's perfumed cigaret is not a problem. President Paul's discussion of these matters and "academic liberty" is interesting.

OLD things that keep savory without becoming rancid are prized, especially in this age when many things are so fresh. A certain class of conservative Americans from all sections have been finding their way for three-quarters of a century to the school now known as Taylor University, which is situated about a hundred miles northeast of the present American center of population. As if to symbolize its simple, industrious student life, Taylor has the modest Hoosier town of Upland, Indiana, for its post office.

Student care is responsible for these well-kept farm buildings.

Work — honest, thorough, diligent work—in farm, greenhouse or school plant, is the watchword at Taylor, and is built into the fiber of generations of students who are serving humanity and gaining a reputation for getting results.

Recently one went to Harvard with his Bachelor of Arts degree from Taylor. At first he was an object of distrust for the obvious reason that there is a difference between Taylor and Harvard. He wanted to capitalize a bachelor's degree from Taylor toward a master's degree in Harvard. He was sent to the classes for a tryout, with the following results: Distinction in all subjects; elected to a research fraternity in the department of education; given a scholarship based on rank; approved for half-time position on state pay as one of Harvard's agents in the "psychological research department" to visit the charitable institutions of Massachusetts, a thing for which a Taylor man has a rare fitness, for he is very human, a student of human nature, and pretty well acquainted with the unveneered article. The outcome was that Harvard authorities, instead of questioning his right to enter for a master's degree allowed him to proceed as a candidate for Doctor of Philosophy, without extra requirements. He belongs to a type. The moral—pardon a superfluous explanation—is that students where labor is honored, where an independent spirit of democratic Christianity is fostered and the modern vices are taboo, will take rank above the average level—all other things being equal.

The Association of American Colleges, to which Taylor belongs, is a kind of sizing machine for college policies. Occasionally the school gets an inference that it violates the American standard of open-mindedness in seeming to require its faculty to avoid certain views in religion and economics. For instance, German destructive Biblical criticism and Russian philosophy of communism are equally alien to the ideals of Taylor. Not because they are feared, but because they are clearly understood and measured, they would not be tolerated a single day. Taylor's students and faculty are all capitalists and all laborers at the same time; and the graduates go out with the conceit that there is no difference between a capitalist and a laborer if they are the right kind of capitalist and laborer.

The lack of freedom is only apparent. Scholars are multiplying who want the refreshing privilege of sowing the seeds of true American doctrine in a field sufficiently fenced so that they can reap a harvest without being molested by the crows or the cows. A lover of academic freedom would be delighted to see how perfectly free are Taylor's professors. They come because the school is the element in which they preferred to labor, and a man in his element is free. Sectarian doctrines are not a test of membership in the Taylor student body. One can belong to any church on earth or no church and, if a gentleman or lady, there will be a welcome at Taylor. An earnest, altruistic spirit of evangelism pervades the school, but no one ever gets after a student with a funnel to serve him with salvation.

Taylor holds a brief for principles rather than people. Men come and go; but it is felt that in the interest of coming generations the school must go on forever. The art of balancing the old and the new is one of the essential elements in the law of progress. Luke McLuke says that any cook can boil an egg too hard or too soft, but it takes a trained cook to boil it just right. We have fundamentalists who play up the notions of the Middle Ages as essential to salvation and modernists who put everything under suspicion which has belonged to previous generations. Taylor tries to split its difference and keep in the road. It is not so much the mission of modern leadership to blaze new trails as it is to find true trails. Taylor's slogan for the old-fashioned Bible, the old-fashioned church and the old-fashioned home, intelligently defined, has proved to be very wholesome. It does not seem at all archaic or quaint when put into operation under the glare of electric lights and the echo of radio. Students of modern problems sometimes come for miles to see the result of trying to conduct a co-educational college without tobacco, dancing, and the kindred supposed concomitants of a modern college. Some are skeptical about the possibility. A W. C. T. U. national official recently wrote to inquire what measures and influences were invoked to prevent or reduce the evil of smoking among the girls! We could only reply that we had no tobacco in any form throughout the institution.

Main buildings of Taylor University.

It is not the function of this article to outline a program or advance theories on how the various modern abuses are to be reduced or excluded from the colleges. Our policy could not apply universally to state and church schools. If it were brought about by artificial or arbitrary rulings a large fraction of American youth would be excluded from privileges of higher education.

This would be impractical, for the thinking of the times tends to confirm the youth and even their parents in theories adverse to the "old-fashioned," and it is necessary to deal cautiously on questions of right and wrong that seem to be two-sided. No youth could be expelled from Taylor for the use of tobacco, because it is not an expulsion offense in the college world. Moreover, the logic of such an act might insinuate offensively against the youth's father or even his pastor. He can and is required to withdraw, with whatever grades he may have earned, on the ground that we have a right to conduct a school of students whose brains are free from the influence of nicotine.

If we were to speak for the college world as a whole and were optimistic enough to believe that a reform was desired on these moral and near-moral questions among students we should have to suggest that there be a strenuous propaganda of preaching and teaching, tempered to student psychology, and calculated to create a new viewpoint.

The youth of America have many redeeming traits. If they are often guilty of wrong practices it is because they are the inheritors of wrong views which to a large extent has been passed on to them from their seniors. If they are not quite so capable of the deeper reasonings as their seniors they are often even more responsive to the decree of reason when it breaks in upon them.

It follows therefore as a psychological fact that the greatest moral convictions and the greatest spiritual awakenings we ever witnessed were in schools of higher learning.

JOHN PAUL — E. O. RICE — W. G. NIXON

Taylor University is under control of the Legal Hundred, a name coined by John Wesley to denote trustees. The president is W. G. Nixon, a minister of Detroit. The business manager is E. O. Rice, who left a career of unusual promise in the financial world to devote his financial ability to educational and religious causes. The members of the Legal Hundred hold office for life, or as long as they are in cordial sympathy with the ideals of the college as stated in its charter. The normal registration of students at the school is slightly in excess of three hundred.

"For Nothing Changes Here"—Old London

A City of Survivals; the Flavor of Her Shops and Lanes

By GAIUS GLENN ATKINS

THE way into London by train is always through the chimney pots. No railway enters or leaves the city on grade level but commonly above grade and even with the tops of the two-story, grayish yellow tile or slate roofed brick houses which in endless straight, hard streets house the British workman or petty tradesman. Each room in each house is heated by a coal grate, each grate has its chimney flue and each flue its pot, which is just a six-inch sewer pipe, yellow or brown, set on end at the chimney top to help the draft. Every chimney has from two to four of them and the consequent vista of chimney pots through a car window is as unforgettable a memory of London as fire escapes in the East Side of New York, or horse chestnuts on the Paris boulevards. They come out to meet you, a strange, stunted growth, whose flower or fruit is smoke, and the unchanging solidity of them assures you. It may have been a year or a decade since you saw them last but "Come on," they say, "we are quite the same, 'for nothing changes here.'"

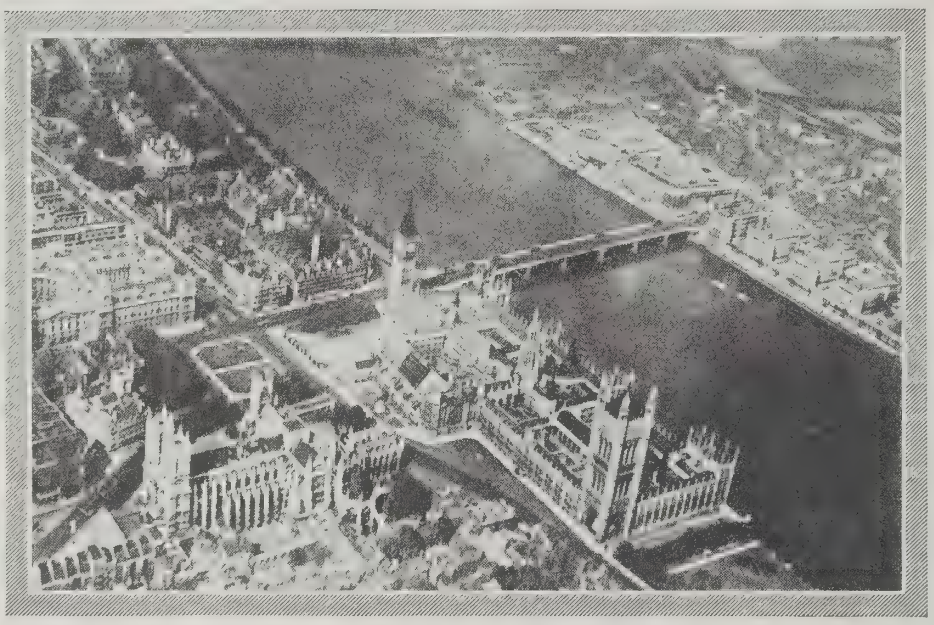
You can always go back to London, as to no other city anywhere, confident that you will find it much as you left it, always provided, of course, that you have been there since the "Great Fire." The London papers were discussing that fire recently and generally agreed that the town had changed since. But that was 257 years ago. The "Great Wind" also did considerable property damage, but that was 220 years ago. The "Great Frost," comparatively recent (180 years ago), seems only to have frozen the Thames. The ice has since melted, though it would be difficult to convince some visiting Americans of that fact. Historians who are unduly careful about detail insist that the present London is hardly older than the reign of Queen Anne and maintain with a reasonable show of authority that a visitor who had not come up to town since James Stuart would have difficulty in finding his way about.

But an ancient Briton might still recognize Tower Hill and its general relation to the river; a Roman gentleman would find fragments of his city wall here and there, notably in the north wall of the new post office. He would discover his hall floor mosaics in a museum and he might possibly stumble upon his bath a bit back from the Strand. King Alfred, if he were permitted to dig about, could find foundations he laid under the "White" tower of the present tower group, and William the Conqueror could without much difficulty recognize what he built on those older foundations. Henry the Third and his son Edward would feel entirely at home in the Abbey and likely beg to be excused from subscribing to a fund for its repair, urging that what they built had stood up well enough for almost 700 years and the twentieth century could do its own repairing.

Sir Christopher Wren would find his dome still brooding over streets whose names would be unchanged, and wander from one perfect church which he built to another, finding them changed only in their want of worshiping congregations. John Bunyan would feel much at home if he should sit of an hour some morning in Bunhill's Fields Cemetery. Something would be changed, of course, in the buildings which look down upon a burying ground which is now a field only in name, but the worn sandstone gravestones would be neighborly enough and he would make no complaint of being buried with Isaac Watts and Susanne Wesley and Defoe and William Blake, counting such sepulchre under the open sky—from which he was, while he lived, much shut away—more to his taste than abbey chapels. He would not note what the visiting American notes: that in this same Bunhill burying ground there are, upon its weathered headstones, more surnames still to be found among living folk in New England towns than in any equal space in England—a testimony to the tide of migration which ran from old London town to Boston and Salem.

Samuel Johnston would find a chair waiting for him in the old Cheshire Cheese, the cheese as ripe and the ale as mellow as he knew them. And if, having dined there, he should still walk down Fleet street he would find his way easily enough and recognize familiar names as he walked.

Not that London does not reflect what is happening to England and the empire. It does. I spent a rainy evening in a Gower street rooming house (but Charles Darwin wrote "The Origin of Species" in Gower street) reading a London guidebook of the eighties. From the pictured costumes of the women to the discreetly noted diversions of the Prince of Wales it described an order as extinct as the Michigan wood pigeon, and London has shared those changes but in such ways as completely to mislead you. Paris draws a straight edge across the map of what she has left of two or five hundred years ago and drives through the Latin Quarter fire new avenues as near gingerbread as the French can do anything, till the Boulevard Raspail fairly screams at the tangle of old streets Dante may have seen, and old churches stand blinking in the light almost shamelessly disclosed, or else her mobs burn up history, or whatever corresponds to her city council changes the name of old streets overnight to immortalize a new hero. (But a Paris street name confers a doubtful immortality.)



Aerial view of Houses of Parliament and Westminster Abbey, London.

Not so London. Occasionally a new vista is opened and the names of London streets do reflect a changing order—there are now six Victoria roads—but it is done discreetly and the steadfast vastness of the city, which comes nearer being a world of its own than any city in the world, gathers the new to itself and loses it in the mass. The rain, the wind and the smoke attend to the coloring. The smoke darkens marble or granite, the rain washes darkened surfaces clean in patches, the wind directs the rain and you have that mottled play of light and dark which makes old St. Martin's in the Fields and the new Courts of Justice contemporary to the eye, and gives to London its color scheme. There is just now an unusual amount of building in Regent street; old leases have expired and new shop buildings are going up, but it is all so deftly blended that ten years from now you will never know it.

The buildings are all low. I went out on the top fire escape of the highest building in the city this summer with a young newspaper man who wanted to show me how his paper was flashing running electric light bulletins over Trafalgar Square, but it was no dizzy height, six, maybe seven stories. London has thus an arrestingly even sky line, broken only by the dome of St. Paul's and the towers of the Abbey and the Houses of Parliament. It is a curious mingling of the commonplace and the grandiose. Cockney London is housed drably enough, but here is as good a place as any to say that though there is bitter, bare poverty in London there are no rotting tenements. We asked a policeman who had become our guide for a day to show us the city's worst. He showed us Limehouse and the hard, bare streets which border the docks. He showed us streets full of children and the pitiful little mothers of the poor, their arms overburdened with baby brothers and sisters. He showed us tattered clothes a-plenty and public houses too many. But he never showed us dirty streets or fire traps or rotten wood, or the gray desolation of the "levee" in Chicago or the crowded tenements of the East Side of New York. Nor is there anywhere in evidence in London today the moldy poverty of twenty years ago. The "doles" have their doubtful side but they have met and mastered abysmal poverty in England.

London is generally the East and West ends with their extensions or hinterlands. The East End in old London town is the city of finance and the merchants. It belonged to the commoners as Westminster belonged to the king and his court, and the king may not enter it ceremoniously now save as he is properly met at Temple bar—once a real bar, now a lion and unicorned monument about which the tides of traffic flow—and given right to enter. The bank and St. Paul's and old London Bridge belong to the "city," as do all that Dickens knew and loved and centuries of history as well. It is a city whose winding streets brim with traffic and whose shop windows are full of all the things a man may want, if he wants only books and tobacco and pipes and woolen clothes and a saddle and field glasses and bills of exchange and bank notes and a steamship passage to the ends of the world and the *Times* or *Punch* and roast beef and porter and a church in which to worship and—if he be great enough—a place to be buried; for if he be an admiral or an artist they will bury him in St. Paul's in more select company, on the whole, than the Abbey supplies. There are a million people in the "city" in the daytime and 20,000 at night. The contrast between the East End at ten o'clock in the morning and ten o'clock at night is one of the dramatic things in any city. None are left save caretakers and newspaper men who work in Fleet street and Bouverie street as Thackeray and the Walters or Delane before them.

Should Income Tax Records Be Made Public?

Not a New Question; Benjamin Harrison Discussed It; He Said "Yes"; What Others Say; What Publicity Has Done

By FRED L. HOLMES

TAXATION should be a public matter. It is in most governments. Secrecy encourages deceit and evasion. Publicity circumvents fraud and prompts honesty. Right now there is deep interest in the subject of tax secrecy or tax publicity.

As civilization could not long exist without government, neither could government function without the right to levy taxes. It takes money to administer the orderly rules of society in any community. People become interested in government because it affords protection for the support they give it. Their patriotism in its defense is quickened when they know that all partners contribute on a scale of equality.

Taxpayers not only want to know that the amounts which they pay are just; they desire assurance—proof if necessary—that their neighbors are contributing in proportion. Justice in taxation insures the interest of good citizens in the administration of government. A citizen enthusiastic in civic affairs is a guaranty of stability in good government.

Now the best way to keep up the interest of citizens in their government is to give them the truth about its operations. No group, no class, no individual, owns the government. It was instituted to protect people in their inherent rights—not selfish desires. It was founded for the benefit of all. When these aims are subverted, its welfare is menaced.

The Growing Tendency of Secrecy

THERE is a growing tendency to clothe the affairs of government in the garb of secrecy. This is a serious mistake. To shut out the light of publicity is to substitute ignorance for knowledge; prejudice for high motives; misinformation for the truth.

There is an old axiom, taught in the law schools, that a government record is a public record. So it should be. The transgression of that rule has been fraught with disaster. Secret treaties between governments have resulted in wars. Nearly every scandal in government has come from secrecy.

Just now Congress is dealing with another problem of secrecy. For many years income tax returns, filed both by individuals and government, were public records. Then the rule was changed. Some of the evil results are already apparent.

For the past three years an effort has been made to remove the mantle of secrecy from the Federal income tax records. In the United States Senate, November 5, 1921, the La Follette secrecy removal plan was defeated by a vote of thirty-five to thirty-three. The House of Representatives in the present Congress beat the open secrecy plan, but adopted a restricted amendment which would make the income tax records more public than they are at the present time. So rigid is the old law that committees of Congress, drafting the financial budget of the nation, cannot examine Federal income returns.

There is a sharp difference of opinion among officials at Washington over the question of making income tax returns public records. Secretary Andrew D. Mellon, of the Treasury Department, opposes the publicity plan. Many others agree with him. It is claimed by them that curious people would be examining the returns, that business secrets would become public property, and that excessive earnings by corporations or individuals would be flaunted in the public press, exciting the animosity of citizens with more slender incomes.

Every contention now made against publicity was answered by President Benjamin Harrison nearly a quarter of a century ago. Invited to speak before the Union League Club of Chicago on February 22, 1898, he refuted the arguments made by those who would lock the pages of public records. His address was prophetic. He saw that large aggregations of wealth might desire to keep their tax records secret. In a free government he believed that it was unsafe to make a "show in our homes and on the street that is not made in the tax returns." It breeds contempt for government; it inculcates lawlessness. There is a national lesson in President Harrison's address.

> "Each citizen has a personal interest, a pecuniary interest, in the tax return of his neighbor," declared former President Harrison. "We are members of a great partnership and it is the right of each to know what every other member is contributing to the partnership and what he is taking from it.
>
> "We live in a time of great agitation, of a war of clashing thoughts and interests.
>
> "There is a feeling that some men are handicapped; that the race is sold; that the old and much vaunted equality of opportunity and of right has been submerged. More bitter and threatening things are being said and written against accumulated property and corporate power than ever before. It is said that, more and more, small men, small stores, and small factories are being thrown upon the shore as financial drift; that the pursuit of cheapness has reached a stage where only enormous combinations of capital, doing an enormous business, are sure of returns.
>
> "The great bulk of our people are lovers of justice. They do not believe that poverty is a virtue or property a crime. They believe in an equality of opportunity and not of dollars. But there must be no handicapping of the dull brother and no chicanery, fraud or shirking. If our plan of taxation includes notes and bonds and stocks they must be listed. The plea of business privacy has been driven too hard. If for mere statistical purposes we may ask the head of the family whether there are any idiots in his family and enforce an answer by court process, we may surely, for revenue purposes, require a detailed list of his securities.
>
> "The men who have wealth must not hide it from the tax gatherer and flaunt it on the street. Such things breed a great discontent. All other men are hurt. They bear a disproportionate burden. A strong soldier will carry the knapsack of a crippled comrade, but he will not permit a robust shirk to add so much as his tin cup to the burden.
>
> "The special purpose of my address today is to press home this thought upon the prosperous, well-to-do people of our communities and especially of our great cities, that one of the conditions of the security of wealth is a proportionate and full contribution to the expenses of the state and local governments. It is not only wrong but it is unsafe to make a show in our homes and on the street that is not made in the tax returns.
>
> "It is part of our individual covenant as citizens with the state that we will, honestly and fully, in the rate or proportion fixed from time to time by law, contribute our just share to all public expenses. A full and conscientious discharge of that duty by the citizen is one of the tests of good citizenship. To evade that duty is a moral delinquency, an unpatriotic act. . . . I want to emphasize, if I can, the thought that the preservation of this principle of a proportionate contribution, according to the true value of what each man has, to the public expenditures, is essential to the maintenance of our free institutions and of peace and good order in our communities.
>
> "Taxes are a debt of the highest obligation, and no casuist can draw a sound moral distinction between the man who hides his property or makes a false return to escape the payment of his debt to the state, and the man who conceals his property from his private creditors. Nor should it be more difficult to follow the defaulter in the one case than in the other. If our taxes were farmed out to an individual or to a corporation, they would be collected. There would be a vigilant and unrelenting pursuit. The civil and criminal processes of the law would be invoked with effect, just as they were against fraudulent debtors under the bankrupt law.
>
> "Mr. Lincoln's startling declaration that this country could not continue to exist half slave and half free may be paraphrased today by saying that this country cannot continue to exist half taxed and half free.
>
> "We have too much treated the matter of a man's tax return as a private matter.
>
> "We have put his transactions with the state on much the same level with his transactions with his banker, but that is not the true basis."

Experiences of the national and several state governments in dealing with income tax returns demonstrate the sanity and truth of Mr. Harrison's statements.

Horace Greeley Turns on a Light

DURING the Civil War period there was a Federal income tax law and it contained no secrecy clause. Horace Greeley, editor of the New York *Tribune*, believed in publicity and he indicated that he intended to publish a list of the income tax payers in New York. Efforts to stop the publication proved of no avail. Just what effect this publicity had upon the tax record was disclosed in a New York *Tribune* editorial, January 26, 1865. It says:

> "We learn that the publishing of the list of income tax payers in this city, against which there has been so much absurd outcry, is likely to prove beneficial to the revenge as well as to the consciences of some of our 'best citizens.' Already, as we understand, considerable sums have been returned to the assessors and paid to the collectors by persons who have discovered 'errors' in their original returns of incomes since the publication of the lists referred to, and assessors have received valuable information in reference to the incomes of some gentlemen who should but have not yet amended their returns. The penalties for false or fraudulent returns are, first, an assessment of double the amount sought to be evaded, and second, a fine, not to exceed $1,000, or imprisonment not exceeding one year, or both, at the discretion of the court. It is presumed that all persons who on reading the printed lists discover that they have made mistakes in their returns of their annual 'gains, profits, or incomes,' would be able to adjust any little difference between themselves and the public treasury with greater facility by calling voluntarily upon the assessors of their respective districts than by taking the risk of being waited upon by those officers."

Then the policy of the government was changed in 1870. Federal income tax returns were made secret documents. At once the results of the closure became apparent. In 1870, the last year of publicity, the number of Federal returns showing incomes of more than $2,000 was 94,887. In 1871, when publicity was prohibited, the number fell to 74,000—a decrease of twenty per cent. It declined again in 1872 to 72,000—a reduction in the number of payers in this class of 22,000 in two years.

North Carolina had a similar experience. When Josephus Daniels published the list of income tax payers in the *News* and *Observer*, the returns of income taxes nearly doubled. The plain fact seems apparent that publicity cures dishonesty and fraud in making tax returns.

Nor is the experience in Wisconsin without point. A state income tax law was enacted in 1911, and in spite of the fact that all real estate and personal property tax returns are public records, the state income tax return was made a secret document. Mark the result.

A Disparity in Returns

SOON after the World War a Federal agent employed in the Internal Revenue Department "tipped" the governor of the state that a great disparity was found in the returns filed by many Wisconsin corporations for payment of state income taxes and Federal income taxes. Auditors for the state tax commission soon verified the statement. Governor John J. Blaine called a special session of the Wisconsin legislature and asked that the secrecy ban be removed. This the legislature refused to do. Appropriations were increased, however, for auditing some of the books of the big corporations.

"After the close of the legislative session of 1921 I turned my attention to the question of the auditing of income tax reports. I found that in the two years preceding 1921 the Tax Commission had succeeded in adding additional income taxes, through the field audits, of $102,834," said Governor Blaine in a recent interview. "These were from 127 corporation returns only. I obtained from the Tax Commission information respecting this subject and I found that, in its opinion, there were about 14,000 corporations doing business in the state and of that number approximately 3,200 income tax returns of corporations ought to be audited.

"On the eighteenth day of November, 1921, I called a meeting in the executive office of the members of the Tax Commission, the secretary of the State Board of Public Affairs and the secretary of the State Board of Education, to discuss the possibility of making the field audit more effective. As a result of that conference I requested the Tax Commission to address a request to the State Board of Education to assist the Tax Commission in the administration of the soldiers' educational bonus, and to ask that $40,000 be placed at the disposal of the Tax Commission out of the soldiers' educational bonus fund. The Tax Commission on the same day complied with said request, and the secretary of the State Board of Education immediately procured the approval of the suggestion by the members of that board, and immediately thereafter I called a meeting of the emergency board and transferred from the special fund $40,000 and placed it at the disposal of the Tax Commission.

"The result, however, of that proceeding was not effected until 1922. For the year 1921, fifty-five corporations, through the field audit, were required to pay additional income taxes of $410,173.64. Through the intensified auditing following the conference, the result of the 1922 audits to December first was that an additional income tax of $1,821,749.34 has been placed in the process of collection. The total of all audits for the last two years, ending in 1922, yielded close to $3,000,000 additional income taxes.

"A special session of the legislature was called on March 22, 1922, for the specific purpose of considering the repeal of the secrecy clause. Thereafter an educational campaign was conducted throughout the state. Every person was given a hearing. The taxation question, including the secrecy clause, was no doubt the paramount issue before the people, and those, in nearly every case, who voted to repeal the secrecy clause received the overwhelming approval of their act by the people, and in most instances those who opposed the repeal of the secrecy clause were repudiated by the people.

"The 1923 Wisconsin legislature promptly repealed the secrecy clause in the state income tax law. The time for the filing of income returns expired March 15 of this year. We will soon be able to ascertain from experience the benefits of publicity. Some accomplishments are already apparent. As a result of the public discussion and the possibility of the repeal of the secrecy clause, much good has come. I find as to individual incomes there was an increase of more than seventeen per cent as to the normal tax; more than thirty-four per cent as to the educational surtax and more than thirty-three per cent as to the teachers' retirement fund tax, for the year 1923, over the year 1922. Tabulations as to the corporations have not been finally completed, but there has been an increase in number filing and in net incomes subject to taxation.

"I have contended and now contend that secrecy in government is a bad thing; that taxation is a public matter and not a private matter; that the tax returns of those who pay real estate and personal property taxes

(*Concluded on page 14*)

Civilization Should Meet With Its Creditors

Differences Between Money and Wealth; High Finance Methods

"IT IS high time that civilization should have a meeting with its creditors," declared Professor Frederick Soddy, F. R. S., of Oxford University, in an address before a London audience, December 12, on "International Economics."

The distinguished scientist's London address followed close upon a series of philippics against high finance delivered in November to enthusiastic and receptive audiences in Edinburgh and Glasgow.

Professor Soddy said in part:

"For many years I have been following a particular line of thought of my own and I have come to the stage in which I was about to apply this to international questions.

"To begin with, we scientific men feel, I think, that the world at the present time, in so far as it is different from the earlier world, is *our* world. We feel that the difference between this age and two centuries ago is primarily and fundamentally due to the harnessing of natural forces of energy.

"I think we can trace the whole of the evils of the present day just to the antagonisms between a new mode of living discovered by science and an old mode of economics based upon a type of life which has actually been superseded.

"A machine today can embody tens of thousands of horse power, every horse power equal to the work of ten men, and that machine can work eighteen to twenty-four hours a day, so that it can produce as much as 300,000 persons could produce in the time of Adam Smith. Scientific men see this colossal production with which their labors and inventions have endowed the world, not used for any good purpose, but perverted, resulting in the great problem of unemployment, which is a direct consequence of doing away with human labor in the production of wealth, as well as in modern war, where every new invention, every new discovery, is used for the purpose of destruction rather than construction.

"The production of wealth on a colossal scale ought undoubtedly by now to have inaugurated a system of abolishing such evils; but instead of that, the wealth has been used to accomplish the direct opposite and a larger and ever larger fraction of the population is reduced, through unemployment, to destitution and misery, not because of any shortage of wealth, but for precisely the opposite reason—because of the glut of unsalable goods that follows these new scientific methods of production.

"The phenomenon of modern war results primarily from this excess of production, which needs to be exported to less developed countries—it is a struggle for markets which has to be backed by armies.

"In the past, men fought for true economic reasons—driven by hunger resulting from food shortage to raid other lands for what they could take away. Such wars were not of great consequence because the people on both sides were soon exhausted.

"The Great War went on for four years, and at the end of that time both victor and vanquished ought to have been economically exhausted, but they were not. The war was not brought to an end by any shortage of materials, but by exhaustion of human energy . . . . Germany was able to hold out—cut off from all external supplies—because she had mastered the process for fixing atmospheric nitrogen, originally for the manufacture of fertilizers, but easily diverted to the manufacture of explosives.

"The public must understand that these scientific methods can be used as well for peace purposes as for war. The scientific man is not responsible for the use made of his inventions and discoveries. If at the end of the war our marvelous productions had been used for constructive purposes, we could by now have rebuilt our whole civilization on a plane of which no man need be ashamed . . . .

Wealth—Embodied Energy

"WE MUST examine this power which can prevent a nation from enlarging its life in time of peace but which does not operate in time of war. All through history nations have been unstable—every power that has arisen has become wealthy and has fallen. The case of Rome is historical. Spain conquered the Eldorado of the West and fell so low that it has not yet recovered. The problem is not national, but universal. Science is gradually conquering and using all the powers of nature, but the abundance of wealth it produces brings not happiness and prosperity, but the exact opposite, poverty at home and war abroad.

"Why is this?

"That question can be answered in one word, a word not used today in polite society though in general use in the Middle Ages, 'Usury'—simply the power of money.

"Ruskin defined wealth as 'power over the labor and lives of other people.'

"A scientific definition of wealth is now possible—*wealth is embodied energy*. There is a strange relation between this 'energetic' view of wealth and the view taken by the ruling classes. The physical scientist and those who work for their living mean by wealth—food, clothes, and the necessities of life, while the economists and members of the ruling classes deriving an income from funds and investments have a conception of wealth which is the direct opposite of this.

"During the recent election the capital levy—a proposal of the Labor party for extinguishing the national debt—was described as the destruction of the country's wealth. The moneyed classes hug their debts under the conviction that they are fostering wealth. The people are not allowed to produce the abundance which they easily could because 'money' is kept tight.

"It is an extraordinary thing that in its struggle with autocracy democracy has forgotten altogether the question of money and its control. On examination, ninety-nine per cent of the money in this country will be found to be counterfeit, issued in the form of loans or checks—a concertina, at one moment inflated, causing purchasing power to increase and industries to thrive, and the next deflated, so that purchasing power is reduced and the evils of unemployment follow, while the wealth of the country is bought by the usurers for a song.

Not Wealth But Money—

"THERE is no doubt that if we controlled our money, we should be in a position to repay our creditors as far as we desired, but the cause of such evils is that *creditors do not desire repayment and would refuse it if offered. We could bury them under wealth if that was what they wished for, but they want not wealth but money—money to put out to usury so as to get a permanent income from interest without spending their capital* . . . .

"The result at home is that the country is not producing one-quarter of the wealth it could produce, while internationally the stronger nations are trying to get the weaker nations into their debt and to prevent repayment so as to extract permanent interest. It is obviously unreasonable for a creditor to want his payments deferred and to charge interest until the payment is made, and if wealth were made legal tender for debt, repayment would be easy and usury could be abolished. The wealthy man dares not ask even for his capital, for he could not use it—he could only sell it, and he would have to ask to have his debt repaid gradually . . . .

"If an alchemist gave us by transmutation an unlimited gold supply so that all international debts could be paid, would he not have made fools of us? It is high time civilization had a meeting with its creditors, but if it paid them off in gold they would say that gold tokens merely represented indebtedness and were of no use to them, for what they really want is wealth.

"The reform required is simple but it would need a very courageous democracy to undertake it."

"Can England lead the way in this reform? Politically it would be a tremendous advantage to overcome the moneyed men—the jugglers with the currency, the bankers with a power no autocrats ever had and which they have obtained and hold on account of the ignorance of the democracy. There would be no difficulty in getting rid of these, for they would have no support when once the facts were understood. Some will think the press a difficulty, but there is no need to worry about it—in England the press has been bought and is discredited.

"The situation abroad is more difficult. One would have to anticipate a flight of money and of those owning it. The remedy would be to send their gold after them. It is time that those who have the knowledge, the will, and the heart, should find a way out—science, religion and labor must unite."

A Libel on Scotsmen

Concluded from page 5

fishwife had died, and her daughter was relating to the neighbors all the details of her illness, how she had nursed her mother and applied poultices, and so on. She concluded in a sad, mournful tone: "But, ma freens, I've the prood satisfaction o' knowing that she has gone to a better world wi' the mark o' my mustard poultice on her breest."

Despite the tradition that the average Scot is of a dour disposition and resents every attempt at putting the joke "on him," he is a firm believer in the line which says, "Laugh, and the world laughs with you." When the jokes are good he can enjoy them—even at his own expense! For instance, an Aberdonian was once asked his impressions of London on a Sunday. He replied:

"Oh, it's just like Aberdeen on a Tag Day: No a soul to be seen on the streets."

But there are times, occasions of mental excitement and stress, when the Celtic nature inclines to the vitriolic. An English lady entered a butcher's shop in Inverness and wanted an English sheep's head. The butcher said there was no difference between an English and a Scotch sheep's head. The lady, however, was very persistent—it must be an English one and no other. So the butcher, losing his temper, went into the back shop and was heard to exclaim to his assistant:

"Hi' Tougal, skin ta sheep's head, an' mak' it English. Tak' oot the brains but leave in the tongue." Thus was Culloden avenged.

I will conclude with an episode of one of the scenes of which I myself was a witness. It was in a royal burgh on the borders of the Highlands, just before the war. It was New Year's Eve, commonly called "Hogmanay" in Scotland, and three bosom cronies—Sandy the souter, Jamie the baker, and Donald the butcher—foregathered in the back shop of the latter, after closing time, to celebrate the departure of the Old Year, and welcome in the New.

It was a Saturday night, and when Donald had pulled down the window shade and turned off the lights in the front shop, the trio adjourned to the rear of the premises and spent an hour or two to their mutual satisfaction.

"Wha's Deid?"—Nobody

NOW Donald, although a bachelor, was likewise an elder o' the kirk, and saw to it that his boon companions, who were both married men, did not prolong the revel until an unseemly hour. Having bade them good night, Donald returned to his seat by the fire in the back shop and fell asleep. So sound were his slumbers that when the sun arose on that Sabbath morn he stirred not, and the first bell had clanged from the steeple of the kirk, of which he was an ornament and a shining light, and some of the good folks were beginning to stir on the streets ere he awoke.

"Bless me," said Donald, "I've sleepit in," forgetting in his excitement that it was the first day of the week, as well as the first day of the year, and thinking only that he had neglected to open his shop at the usual hour. Jumping up, he hurriedly donned his blue and white striped apron, pulled up the window blind, opened up the front door, and stood looking forth with all the alertness he could command, ready for the first customer. Who should he espy coming along the street but his friend, Sandy the souter. Sandy, who was a magistrate of the burgh as well as a worthy citizen, was arrayed in all the glory of a frock coat, "lum" hat, and black trousers. Donald was a bit surprised at this display of grandeur and at once hailed him: "Good mornin' Sandy, will ye be goin' to a funeral the day? Wha's deid?" "There's nobody deid, Donald. This is the Sabbath Day, an' I'm gaun tae the kirk."

Donald's meat emporium was closed in record time, but his fall from grace will be remembered by his fellow citizens unto the third and fourth generation.

Sir Archibald Alison in His "History of Europe"

WHEN sixteen hundred thousand men, on both sides, were in the Continental wars with France in Germany and Spain alone, where nothing could be purchased except by specie, it is not surprising, that guineas went where they were so much needed and bore so high a price . . . . In truth such was the need of precious metals, owing to this cause, that one-tenth of the currency of the world was attracted to Germany as a common center, and the demand could not be supplied; and by a decree in September, 1813, from Peterwalsden, in Germany, the allied sovereigns issued paper notes, guaranteed by Russia, Prussia and England. These notes passed as cash from Kamchatka to the Rhine, and gave the currency which brought the war to a successful close. . . . To the suspension of cash payments by the act of 1797 and the power, in consequence, vested in the Bank of England, of expanding its paper circulation in proportion to the abstraction of a metallic currency, the wants of the country and the resting of the national industry on a basis, not liable to be taken away by the mutations of commerce or the necessities of war—it is to these facts that the salvation of the Empire must be ascribed . . . . The adoption of the opposite system of contracting the paper currency, in proportion to the abstraction of the metallic currency, by the acts of 1819 and 1844, followed, as they were, by the monetary crises of 1825, 1839 and 1847, have demonstrated beyond a doubt, that it was in the system of an expansive currency that Great Britain, during the war, found the sole means of her salvation. From 1797 to 1815 commerce, manufactures and agriculture advanced in England, in spite of all the evils of war, with a rapidity greater than they had previously done in centuries before. This proves beyond a doubt the power of paper money to increase the wealth of a nation.

The Deserted Hill Farms of New England

Decayed Homesteads, Relics of Past Prosperity, Dot the Adirondack Landscape

One only master grasps the whole domain,
And half a tillage stints thy smiling plain.
No more thy glassy brook reflects the day,
But, choked with sedges, works its weedy way.

Sunk are thy bowers in shapeless ruin all,
And the long grass o'ertops the mouldering wall;
And, trembling, shrinking from the spoiler's hand,
Far, far away thy children leave the land.

Princes and lords may flourish, or may fade;
A breath can make them, as a breath has made:
But a bold peasantry, their country's pride,
When once destroy'd, can never be supplied.

A typical deserted farmhouse in the Adirondacks, falling into decay. Raspberry bushes are trying to cover up the desolation of the place.

By D. JAY CULVER

TUCKED away in the Adirondacks are hundreds of deserted farmhouses, falling to rack and ruin, becoming more dilapidated with each succeeding storm. Each year the moss is a little heavier; each summer the ivy creeps a little higher about the old houses where a few years ago large families were contented and happy. The men and women who played in the old barns as children are now scattered to distant parts of the country.

The pathos of Goldsmith's "Deserted Village" is in this unfortunate but inevitable state of decay. The tragedy is that it is inevitable. While other sections of the United States are becoming more prosperous and new homes are being built in the West, the farms of the Adirondacks, as well as throughout all of New England, are being deserted one by one.

An old-timer who remembers when the Adirondack farmers were at the height of their prosperity.

Tourists who spend their vacations traveling in these sections do not realize the extent of the desertion. On the smooth main highways they may see a deserted farm here and there, but it is when one leaves the highroad that one begins to see the extent of the desertion.

One may travel for miles along dusty country roads, winding in and out among the mountains, and not discover a farmhouse which shows any signs of life. There are various degrees of dilapidation. Trees nearly a foot in diameter now stand where the farmer used to plow and plant. Barns and the other outbuildings on the place are fallen wrecks.

Time has done a thorough job. One would scarcely believe that the marks of a farm could be obliterated in so short a time. But not all the farms have been abandoned for twenty years. The tide began to turn about two decades ago and since then the tenants, attracted by promises of a life of greater ease and fewer hardships, have forsaken the farm for the cities and near-by towns.

The younger generation has been responsible for this great change. Being dissatisfied, they nagged their parents to sell "the old homestead" and move to town. The old folk usually refused absolutely to do any such thing. They were guided by sentiment. Many farmers lived on places that had been owned by their fathers before them, and they lived in farmhouses that had been built by their fathers. Some could remember when, as children, they had moved from a log house to the fine, new frame house that had been built by the joint efforts of the neighbors. In some cases the land had been in the family for more than three generations.

Tired old farmers thought of the years of back-breaking labor that they had spent in cultivating the land to raise enough to keep the family alive. They thought, too, of the energy that father or grandfather had spent in clearing the land, removing the huge rocks so that plowing might be possible, and the thousand and one other laborious tasks that had to be performed by the pioneers before life in that region was possible.

They had been born on the spot and their desire to stay under their own roof-tree was greater than their desire to go somewhere else and begin life anew.

Families were large twenty years ago. Each farmhouse was crowded with a dozen or more children. As the children reached a marriageable age, they lost no time in leaving home for more lucrative employment in the city. The girls were not in a receptive frame of mind when young fellows asked them to marry and settle down on farms of their own. They knew it meant drudgery, so they passed it by with a shrug of their shoulders.

But in time the old folks passed and were laid away in the hillside cemeteries. As a rule the children disposed of the property as soon after the funeral as possible. The places found purchasers mostly because the lumber on the land was valuable. The lumber was worth four or five times the purchase price of the abandoned farms.

These lumbermen who purchased the old places were not interested in the farms or farmhouses. They boarded up the windows and doors and let everything go to ruin. They could afford to wait for the timber.

Just as the gold seekers in 1849 sent back glowing reports from California of their success and thus enticed their former neighbors to leave their homes, the people who abandoned their farms and moved to the city wrote back to their friends and told them how much happier and how much richer they were in their new homes. Those who remained behind hesitated. They were lonesome. Even if their nearest neighbor lived two miles away, it was a great satisfaction to know he was there. After he had departed and his house was closed up, the sense of loneliness grew. It was natural that one family should follow another until the region was nearly deserted. Florida has been populated that way, and in that way have the New England hills been denuded of their old population.

The land was never very fertile, even as far back as the Revolutionary days. The old settlers spent more hours than will ever be computed in clearing the land of its forest and stones, preparing the ground for cultivation. It was a long, uphill fight all the way. The land being poor to begin with, and not receiving fertilizer, eventually gave out.

If the farmer could attribute poor crops year after year to nothing else, he decided that the land had "petered out," to use one of his own picturesque expressions. Instead of rotating his crops or plowing deep, or plowing under some clover to enrich the soil, he preferred to clear a new piece of ground. The abandoned field became part of his pasture land. The process of clearing the new piece of its surplus rocks had to be repeated. Every year, there seemed to be more stones in the path of the plow than the previous year. This did not take place overnight, but slowly through generations. The farmers never realized that they were committing agricultural suicide.

The schoolhouses in many districts are lying empty, or if not empty, attended by but two or three children. The schoolhouse pictured here had an enrollment of forty children thirty years ago. The place hummed with activity. The school teacher was usually a young man earning money with which to attend college. The children ranged in age from five to eighteen.

Today there are two pupils attending this school, and one is only four years old. She is sent to school for the old-fashioned reason—to be kept out of mischief. Her mother figures that the teacher has more time to spare than she has. Sometimes she goes to sleep on one of the long benches and the teacher lets her slumber for hours at a time.

The teacher really has just one pupil. This girl is about eleven years old. The school board experiences great difficulty in getting teachers to stay at this school.

The prospect of having just one pupil is attractive at first, but after two or three months of teaching one girl five days a week and five or six hours a day, with nothing to vary the monotony, is more than teachers can bear. They resign.

Yes, thirty years ago there were thousands of thriving farms in this region.

The old country schoolhouse, seventy-five years old. Once there were forty children going to school there, now there are two.

"For Nothing Changes Here"—Old London

Concluded from page 10

Yet even at ten o'clock of a morning a step aside takes you into some backwater of a court or quiet street where the deep note of the city's traffic reaches you only as a far-off echo. London's major note is distinctive, a deep-toned voice like drum fire heard miles away. Paris is shrill and staccato, Chicago in the loop is a boiler factory, New York under the elevated is a punctuated roar. The Inns of Court, where the barristers have chambers and offices, are like college dormitories in shaded gardens. The Temple is the Middle Ages in the heart of today. (But take care that you do not step on Oliver Goldsmith's grave as you walk about it in the twilight trying to find the place where York and Lancaster plucked their white and red roses.) Paternoster Row is sacred to sellers of wise books and St. Paul's looks down upon courts you must hunt to find where the tide of the years seems ebbed away. There is no end of little crooked streets with any name you please, Bread street, or Shoe Lane, or Brick Lane, or Shore Ditch—which is just what it once was—or Threadneedle street, or any Saint or Duke or King or Queen you want. Queen Elizabeth's Walk is a semi-suburban avenue, but she walked there once and it is still her walk. There are a score of "old" streets and squares from Old Gravel Lane to Old Jewry, and every one of them packed with humanity. There are people enough to fill all the streets, the traffic flowing down their turnings till you can step from bus top to bus top, and ebbing with the twilight to leave the "city" with its guardian Cathedral Dome and its haunting memories. Then likely the ghosts of its past come out and talk of fire and plague and trade and war and empire—and what ghosts they are!

The river turns sharp south at the west end of Fleet street—Waterloo Bridge crosses the bend—and you walk against its current along the Strand and Whitehall to the Abbey and the Houses of Parliament. Here the kings have left their palaces, plain enough but with great names, and their parks. A London park is a bit of rural England brought to town. The sheep pasture in Hyde Park and listen as unmoved as most of the other hearers to the free speech which threatens a revolution in one breath and promises a new heaven and earth in the next, in which Hyde Park abounds. You can forget London in a ten-minutes' walk there and of a misty September morning the towers and broken sky line of London the magnificent seen across the living green and through the soft mists is a picture not to be forgotten.

The West End is shops with what a man wants plus what a woman wants. "My God," said old Blucher when he saw it first, "what a town to loot." But nobody has looted it yet, though the English tradesman puts up his shutters of a night to protect his silver plate and woolens and leather from such a fate. He leaves a peep hole for the Bobby to look through. The whole arrangement seems to an evil-minded American contrived exactly for the security of burglars—but nobody apparently burgles. Oxford street and Piccadilly, Regent and Bond streets are shopping streets for an empire. Your judgment of them depends on what you want to buy—or see. But for woolens and leather and silver plate and rugs they are quite in a world's class by themselves. The department store does not greatly flourish, but there is the Army and Navy Co-operative on Victoria street, of course. You can outfit yourself there for any expedition in any climate, in a building as full of passages as a rabbit's warren, and do it reasonably well with entire confidence in what you get. There is a tradition that you must have a permit to shop there, but it is now only a tradition. The Civil Service Co-operative Society is more particular.

Most shops specialize and the names of many are classic: Liberty's for the gorgeous fabrics of the East, Maple's for furniture, Heath's for hats, Broadwood's for pianos, Poole's for tailoring, Billingsgate's for fish and a vivid vocabulary, Tattersall's for horses, Covent Gardens for flowers. A shopkeeper who has become something or other to the king is a made man for life, and if his shop has been for a hundred and fifty years a going concern he asks nothing more of Providence but customers.

But London does not shop in Bond street and Piccadilly. It buys in miles and miles of little shops and from miles and miles of carts and costers and sidewalk vendors. Edgeware Road is all shops, and little streets are packed with a traffic so pitifully bare and cheap you wonder how they live by it. The city has theaters and music halls a-plenty. The music hall is a national institution, ranging from the Palace or Alhambra to halls unknown to fame, just another name for vaudeville, good or bad. The audience is more interesting than the stage, packed to the roof, clouding itself with tobacco smoke and the most entirely human audience in the world singing familiar choruses, whistling at command, laughing or crying. You will never think an Englishman cold when you see him surrender himself to the homely joys of a music hall.

London moves about quickly, comfortably, cheaply. The tubes and undergrounds take you anywhere and all connect, though with many winding passages and a deal of going up and down, though elevators and escalators help in that. On the surface the busses go everywhere. A bus top is the place from which to see London and a bus route map is history on wheels. There you see that the winding streets are just old country roads—designed primarily, as Chesterton insists, for the convenience of drunken carters—which have in the slow process of the years taken on city ways. The names on the street corners note the old boroughs through which they wound, still keeping their corporate integrity in the complex municipal administration of the city. The bus terminals are old inns and village greens—green no longer; the soil on which the "Plough" is built has not known a plow this hundred and fifty years, nor has the "Plough" itself any need of "stabling for horses," though it still advertises the stables. (But a London stable is more properly a "mews.")

Your bus takes you through streets whose low sky lines gain charm from the really rich variety of their solid architecture, by parks and palaces in whose gateways red-coated, white-breeched, black-booted guards sit sentinel on black horses, or by barracks where the drill sergeant is doing his hoarsest worst, or by great houses shut away from a curious world by brick garden walls, or from one town center to another—for London is really a group of towns—or out where the fields begin, or up to Hampstead Heath where the city lies beneath you vast, mysterious and somber, and always through streets filled curb to curb with a flowing, winding human traffic tide which makes the streets of any other city seem empty. And next day you do it all over again on another line, and so for a summer in long twilights whose tenderness softens the harsh and clothes the city with the pathos and travail of humanity.

The city has for an American little distinctive things; its street musicians, for example. Just now many of them are ex-service men who turn an honest and reasonably harmonious penny by singing old songs and playing older instruments. Alfred Noyes' barrel organ has given way before them, but there is no lack of troubadours.

"In the city as the sun sinks low."

Often the singer is a woman standing quite alone perhaps in some wholly quiet street and singing with charm to closed doors and windows. If you are in the queue waiting for the pit doors to open at a theater you will be sung to and recited to and shown gymnastics till the pence you give the street performers balance what you save by going to the pit, which, by the way, is directly behind what we call orchestra seats and on the same level, only a rail separates the bench at two and six from the upholstered chairs at ten and six. But you must go two hours early to get next that rail.

Old women and old men as well make a living—one hopes—by selling matches in the streets. A curious law makes 9:30 closing time for match vendors and at 9:30 they stop selling matches. Nor is there any match bootlegging. Girls sell you flowers—if they can—and bring the moors to the Strand in purple heather, and Ireland to Trafalgar Square in shamrock.

But you miss familiar sights of American cities, for in London there are no skyscrapers, corner drug stores selling everything, self-serve cafeterias, shoe-shining "parlors" (though red-coated men will do your shoes in the open), wind-blown waste paper, street sprinklers or, for any long time, dirt, or soft drink parlors—you can get an "American Ice Cream Soda" here and there, but it's a doubtful brew—Great White Ways and the very-late-at-night life that goes with them, dance halls, amusement parks, Sunday theaters or Sunday much of anything else, parked private automobiles, pop corn, peanuts—the empire calls them monkey nuts and takes them to the zoo for their namesakes—or baseball parks, but Lords and the Oval Cricket Grounds make up for that.

Very little is being torn down and equally little being built up. London grows, but always, as since Queen Anne, by a slow and massive encroachment upon surrounding territories. But even that is managed with apparently little machinery of real estate promotion. You will see no fields staked out into subdivisions as you go out of the city; wheat, potatoes and gardens meet London just where the streets stop. On the Chatham and Southeastern Railway, twenty minutes from London Bridge station takes you to a hop field. Some day the country lane will have become a city street keeping its old name, and the hop field a bus terminal, but always with such an assertion of the old over the new as to make it all a part of an immemorial order rich in habit and tradition.

When your time to leave is come, your long train of light little cars drawn at a surprising speed by a light little engine will fairly whisk you out of an old station, across the river, with the towers of the Abbey on your right if you watch and the dome of St. Paul's on your left if you watch, above the chimney pots and out to the open fields, and London is once more a memory. But whether you go back next year or ten years or never you know that Landseer's lions will still guard Trafalgar Square and the pigeons feed on the steps of St. Paul's, the busses run to the bank, the Horse Guards stand under their arches and the sheep feed in Hyde Park, the geraniums will bloom red before Buckingham Palace and London Bridge will not have fallen down.

Should Income Tax Records Be Made Public?

Concluded from page 11

have no veil of secrecy drawn over them; that no honest tax return need fear publicity; that it is only the return made by the man or corporation that evades the law that needs this veil of secrecy drawn over the return to shut out from public view that which may be a fraud, a cheat, or even a mistake.

"The amount of back income taxes which have been dug up and put on the assessment roll of Wisconsin since the repeal of the secrecy clause was agitated now totals more than $3,225,000. Publicity is the only cure for tax cheating. No army of tax auditors or espionage officials can accomplish a fraction of what will come by making all government records public records.

"Secrecy is a bad thing in government. It aids the iniquities of the coal barons, the oil interests, ship subsidies, income tax frauds, or any monopoly. Refunds and rebates in Federal taxes have been shrouded with a dark cloak of secrecy. When public officials are purchasable, the secrecy of the income tax returns makes it possible to pay the public official for a special favor. If the Federal income tax returns were open to public inspection, the dishonest tax dodger would hesitate to lay bare a fraud or a cheat on the government.

"The honest income tax payer has nothing to fear from publicity. The criminal and the tax dodger may well fear publicity."

When the Mellon tax plan came up recently for consideration in the House of Representatives, the contest for the repeal of the Federal income tax secrecy was led by Congressman James A. Frear, of Wisconsin. It failed. But the legislative fight is not ended.

No one contends that publicity of income tax returns should not be attended by all necessary and reasonable safeguards. Under the Wisconsin law, these tax returns are open to inspection by those who have a real purpose for making inspection. Persons asking to examine the income tax return of another must sign a request blank and this is attached to the original document in the files. This little formality prevents curiosity seekers from examining all of the files. But those who have a purpose in making the examination, officials of all sorts, are freely shown the tax returns.

If there were more publicity of the affairs of government there would be fewer scandals. It should be the duty of public officials not only to aid in keeping the avenues of publicity about governmental activities open; they should feel the responsibility of furnishing real information to the public. Knowledge of government will inspire faith in government.

When Democrats Last Met in New York

Concluded from page 3

prospect, political speculation as to the success of the respective candidates, discussions of President Johnson's Proclamation of Universal Amnesty, indicating how close was July, 1868, to the struggle between North and South. In the papers of July 6 was a reminder of the activities of the Ku Klux Klan in the trial then being made of the Columbus prisoners.

Further perusal of the newspapers of the convention week throws much interesting light on the events that followed the gathering of the delegates. Among the impressive things recorded were the large number of ice-water fountains within Tammany Hall. The twelve Morse telegraph instruments installed for the use of the correspondents of outside papers comprised a greater novelty to visiting delegates than will the radio outfits in Madison Square Garden in June, 1924. About 400 reporters covered the 1868 convention, a small number compared with the press observers of present-day conventions.

Of the 636 delegates in the convention only 317 were entitled to vote, and the vote necessary to nominate was two-thirds of that, or 212. The convention organized with Henry L. Palmer, of Wisconsin, as temporary chairman. During the Sunday recess the New York delegates caucused and decided to present the name of Sanford E. Church as the favorite son of the Empire State, Governor Seymour having positively declined to be a candidate. At the opening of the convention on Monday, Seymour was elected permanent chairman.

The convention continued for five days, holding a session daily. In the first eight ballots Pendleton, of Ohio, led over General Winfield Scott Hancock. On the eighteenth ballot Hancock had 144½ votes and Pendleton and dwindled to 56. The proceedings on the fourth day were puzzling to the delegates because of interruptions and delays and clever parliamentary maneuvering. It was apparent that powerful interests in the convention did not want Hancock, and these interests forced an adjournment until Thursday, July 9.

It was then known, according to Mr. Voorhis, who here takes up the narrative again, that in spite of Seymour's protestations to the contrary, he was going to get the nomination.

"Nobody seemed to care who his running mate was to be," Mr. Voorhis said. "He was nominated, and then the big demonstration came off. They cheered on the floor and waved their hats and flags and the band played like sixty. I don't remember just what it played, but I can still see the men before me.

"When finally order was restored, Governor Seymour bowed and made his speech of supposed acceptance but which proved at first a speech of rejection. I don't remember much of what he said, only his last words, which he didn't stand by. He was a fine figure of a man as he stood on the platform, about six feet tall and built in proportion, with a fine face, decorated with 'sideburns'; moustaches were not the thing in those days. He was a fine speaker, and his voice reached every part of the hall. His closing words were something like these:

"'Again I thank you, fellow delegates, for the great honor you have conferred on me, but I cannot be your candidate.'

"Then the crowd did roar and there were cries: 'Yes you can!' 'Yes you will!' 'You'll be elected!' He became their candidate all right but he wasn't elected. Well, it was right after the Civil War and the country was still ringing with the praises of its idol, General Grant, and Grant was the nominee of the Republican party. But we got the convention for New York, at any rate, and we nominated a New Yorker. And now the whirligig of time sends us fifty-five years farther ahead and we are once more to entertain a National Democratic Convention. I am glad to have lived long enough to see this accomplished in our great city."

The Kinetograph Camera in Science and Industry

PHYSICAL life consists in motions. The vast majority of these motions do not involve the directive influence of conscious will. The purely physical motions are automatically economical. The great problem of conscious life consists in securing the greatest result with the least effort. Sometimes the realization of this goal is called efficiency. Scientifically it is an example of conservation of energy brought about by economy in motions. Scientific manufacturing is a study of economic motions which directly affect the cost of production.

Before the advent of the kinetograph (motion-picture) camera, the study of motions in nature was an extremely difficult task. In a recent article in the English scientific journal, *Nature,* reference is made to the difficulties encountered by such early pioneers in motion studies as Marey and Muybridge. The modern kinetograph would have been invaluable to them in their studies of running men and trotting horses.

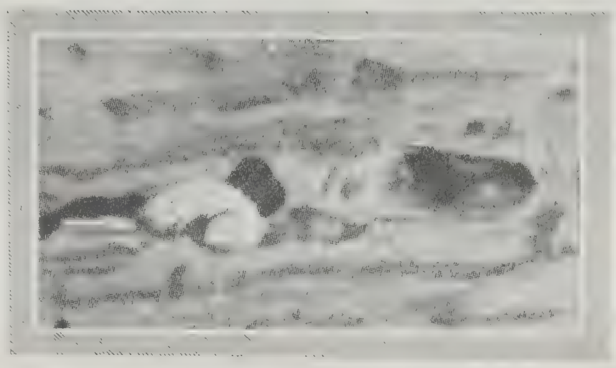
The *zoetrope* was the earliest form of the motion-picture machine. It consisted of a revolving cylinder fitted with vertical slits. Pictures, representing the object in successive stages of motion, attached to a strip of paper, were placed on the inside of the cylinder. The observer, looking through the vertical apertures, saw the object apparently in motion. The ordinary camera was used by the American, Eadweard Muybridge, in his studies of moving horses. His photographs were taken by a battery of cameras placed at definite intervals along a race track. The running horse broke a string which operated the camera shutter. The pioneer work of Muybridge, despite its lack of continuity in the production of pictures, did much to settle many mooted questions between artists and anatomists concerning the motions involved in running.

A Kinetograph camera picture of the method used by a male three-spined stickleback in preparing the ground for the subsequent construction of the nest.

The great American inventor, Thomas A. Edison, first brought out his kinetoscope in the year 1893. A few years later Paul, and Lumiere in France, invented types of motion-picture machines. The outstanding merit of all of Edison's work is that he makes his inventions available to the average man. Serving the common good is the greatest of all achievements. Measured by this standard, Edison is one of the world's greatest benefactors. It is hardly conceivable that even the great prevision of Edison would enable him to imagine the many and remarkable uses that his kinetoscope would be put to within the short period of thirty years.

At the present time the kinetograph is invaluable as a precision instrument in scientific and industrial research. The perfection of the modern motion-picture machine is readily recognized from the excellence of the screen image produced from a kinetograph picture one inch long and three-fourths of an inch high. The average magnification, consequently, is about 10,000 times the original area of the film picture. The length of a film strip varies from 120 to 1,000 feet. The time required to run a short film of 120 feet is two minutes. During this period of two minutes, 1,920 individual pictures are shown. In every foot of film there are sixteen pictures. Consequently it requires one-sixteenth of a second to show one film picture. A revolving shutter, placed in front of the projection lens, is adjusted so delicately that its operation synchronizes perfectly with the appearance of the successive film pictures. This shutter is closed during a short period of one-eightieth of a second between every two consecutive film pictures. The remaining four-eightieths of a second of the entire picture period (one-sixteenth of a second) constitutes the actual time of illumination during which the observer sees the image as a continuously moving picture on the screen. The dark gaps, occurring between individual film pictures, have been a source of annoyance to the observer. This difficulty has been overcome in the more recent machines by placing a transparent violet vane on the shutter frame opposite the opaque shutter for the purpose of lowering the high brilliancy and producing more uniform illumination. When exposures are made, the crank of the machine is turned uniformly at the rate of 120 turns a minute. During every turn of the crank eight individual negatives are made. The time exposure for a picture is therefore one-sixteenth of a second. From these negative films positives are produced, for the exhibiting lantern.

The speed of the ordinary kinetograph is not sufficiently high to record properly the very rapid movements of some types of living forms. For this purpose the ultra-rapid kinetograph camera has been constructed. This camera can produce individual film negatives at the rate of from 128 to 160 a second. When such pictures are projected on the screen at the normal rate of sixteen a second, every movement made can be seen and carefully studied by the observer.



The roof timbers of Westminster Hall, built by Edward the Confessor, showing a larva of the deathwatch beetle eating the material.

By using the ultra-rapid kinetograph the British Instructional Films, Ltd., have produced a remarkable series of natural history films. We are indebted to this firm and to *Nature* for the accompanying illustrations, which are reproductions from some of the original pictures. This firm, under the direction of Sir Frank Baines, has produced a film record of the famous Westminster Hall and its remarkable roof. An interesting feature of this film consists in a series of pictures showing the larvae of the deathwatch beetle excavating tunnels in the oak beams.

Another interesting film in the series shows the little three-spined stickleback engaged in the work of nest-building, guarding spawn, and protecting the newly hatched fry from the onslaught of the hungry denizens of the sea. We quote the following from *Nature* (November 24, 1923): "The production of these natural history films is by no means a simple matter, for if they are to be of real educational value, not only must the record show the subject clearly, but also they should be taken by, or under the direct supervision of, one who is thoroughly conversant with the habits, characteristic movements, and life-history of the creature, so that no important phase is missed or wrongly interpreted. The actual taking of these records of animal life calls for great technical skill and judgment and for the exercise of untiring patience, for the difficulties to be surmounted are infinitely greater than in ordinary photography. Hours of patient watching and waiting have to be faced, and often when the end seems in sight something will happen; the stock of film in the camera runs out, or the sky becomes too overcast to permit sufficient light for the extremely short exposures necessary, and the final stage is missed—perhaps the last possible chance of the season—and the whole of the work has to be begun all over again the following year."

When recording the movements of small insects the focus must be continuously readjusted. This is necessary to insure that sharp definition which is required, that the enormous subsequent enlargement of the picture, which is projected on the screen, shall be satisfactory in every minute detail. *Nature* also points out the following additional difficulties: "Last, but by no means least, the subject, if a bird or a mammal, has to be accustomed to the presence, and the sound when in operation, of the kinematograph camera; this often calls for considerable patience, for all wild creatures are suspicious of unfamiliar objects or sounds. In obtaining successful records of the rare and interesting maned wolf of South America, the kinematograph apparatus had to be set up again and again and the mechanism run without any film, before the animal could be induced to tolerate its presence or move about in a natural manner."

An important industrial application of the kinetograph consists in the recording of the movements of highly skilled mechanics. The minute electric light which is attached to the hand of the artisan records its own historic path on the film. From this record the unskilled are taught the proper motions. The time consumed by various motions is recorded by introducing a clock into the picture. Thus the time of a movement can be measured with the accuracy of one-millionth part of an hour. In surgery the kinetograph has recently found another important application in recording abnormal and defective motions after operations.

Here the camera shows the male on guard at the completed nest, while the female deposits its spawn.

For *"under-water pictures"* the camera is protected by a water-tight chamber or box which is provided with a plate-glass window. Powerful electric lights are suspended in front of the window in order to illuminate the zone near the camera sufficiently to insure good photographs. The water-tight camera box is lowered into the water from a boat. Photographs have been taken by this device at depths of more than sixty feet.

Practically every conceivable subject has been dealt with and recorded on the motion picture film. Crusades against diseases, infections, unhygienic housing conditions, and many other similar dangers to health have been photographed by the kinetograph and thus this practical achievement of Edison has become a blessing to mankind.

URBANA ILL

BRIEFLY TOLD

Alert waiters, using seltzer siphons, extinguished a fire in a theater adjoining the café in which they were working in Paris.

The use of the fez is abolished by inhabitants of Mesopotamia.

Twenty-five per cent of the 2,500,000 public school pupils of the country are taking business subjects, according to authorities connected with the United States Bureau of Education.

A new process of manufacturing synthetic marble has been devised in which the marble is made by a wet method in place of the fire method. The product has the same high luster as marble.

Oregon's compulsory school law, which requires, with certain exceptions, all children between eight and sixteen years of age to attend public school, has been declared unconstitutional by the Federal District Court, sitting in Portland.

Rangoon, Burma, is often described as a "Glasgow suburb," most of the great business houses being managed by Scotchmen.

Jacques Sadoul and Henri Guilbeaux, under sentence of death for treason, are candidates for election to the French Chamber of Deputies on a Communist ticket. If elected they expect to receive unconditional pardon.

When wolves threaten a herd of musk ox, the attacked animals form a circle of deadly down-drooping horns which proves impregnable. A bull may rush out in an effort to pierce a wolf, but he is never lured too far and soon returns to the circle, backs into place and resumes his defensive attitude.

Hundreds of thousands of sea gulls of a new species and coloring are flocking to Southern California, brought there, it is said, by ships coming from the Orient.

A pictorial encyclopedia of the Holy Land is being prepared by a young English photographer who, during the past three years, has collected twenty-two thousand photographs of Biblical scenes. He proposes to illustrate the entire Bible from photographs made chiefly by himself on the spot.

"In dealing with the English language one is often reminded of the characteristic English handwriting: just as an English lady will write in a manner that in any other country would be found only in a man's hand, in the same manner the language is more manly than any other language I know."—*Professor Jespersen,* University of Copenhagen.

The American flag is the second oldest flag in use on earth today.

A new petrified forest has been found in the Mojave Desert in California.

"The International Jew," a four-volume series on the Jewish Question, may be obtained from The Dearborn Publishing Company, Dearborn, Michigan. This set includes:

"The International Jew," Vol. I, 235 pages; "Jewish Activities in the United States," Vol. II, 256 pages; "Jewish Influence on American Life," Vol. III, 256 pages; "Aspects of Jewish Power in the United States," Vol. IV, 246 pages. The price of these volumes is twenty-five cents each; the complete set, four volumes, one dollar.

BINDERS

Readers who desire to save their copies of The Dearborn Independent can now obtain a specially constructed cloth covered post binder. This binder is very practical, holds 52 issues and permits immediate reference to or removal of any copy without disturbing any other issues. Price $2 each delivered. Remittance must accompany orders.

A message by cable from London girdled the earth in eighty seconds. It was sent direct by telegraph from London, by cable to Halifax, then over telegraph lines to Bamfield Creek, British Columbia. From there it was cabled to Sydney, Australia, relayed across that continent by land wires, and sent by cable to Dublin, whence it was relayed to Capetown, which in turn sent it back to London, England, via the Azores.

There are but sixty European bison left in the forests of Europe. Efforts are being made to preserve for Europe this interesting animal in the same manner that the American bison have been saved from extinction.

More Negroes migrated North from Florida during 1923 than from any other southern state.

A new substitute for camphor has been invented by a German chemist.

William Rittenhouse, the first Mennonite preacher in America, in association with others, manufactured in 1690 the first paper made in America. His mill was originally built on the branch of the Wissahickon Creek, Pennsylvania. Samples of the Rittenhouse paper are yet in existence.

By the 1920 census, 1,060,858 boys and girls between ten and fifteen years of age are tabulated as "child laborers" employed in factories, mines, quarries, agricultural work, and trade in the United States.

San Francisco has the highest cancer death rate in the world, with 500 deaths reported in the past five years, according to a prominent physician in Newark, New Jersey, who has made a study of the disease.

A corps of guides will now be at the disposal of tourists in Paris. A notice, passed by the Paris Municipal Council, reads: "It is desirable to preserve French and foreign tourists from the unwholesome influence of unscrupulous toughs without any professional knowledge, who now practice the trade of guides."

Ira Sparks, an Indiana carpenter, who left Honolulu alone in a twenty-three-foot boat en route "to the Holy Land, to take up the work of Moses," landed in the Philippines, Island of Mindanao, March 22. He was at sea seventy-three days without sighting land.

The sculptor of the head of Lincoln on the "Lincoln penny" was a Russian Jew, V. D. Brenner. His initials "V. D. B." on the penny (the first time such a thing was ever attempted in America) caused strong protest and were afterward removed. Mr. Brenner died recently in Montefiore Hospital, New York.

The first use of numerals of which we have record dates back to the end of the second century of our era.

The natives of New Guinea are immune to ptomaine poisoning. Tins of canned food that had gone bad on explorers were in great demand. At Port Moresby, trading in spoiled tinned foods has become a sizeable business.

When a Japanese merchant goes to his banker for credit, the banker wants to see his balance-sheet but also asks about the family. Who are his relatives? Who are his wife's relatives? Will the family council back him up? If the family is a good one, he has no difficulty in obtaining credit.

Coins of Anglo-Saxon mintage have been found in Norway which leads investigators to believe the Vikings of Norway and Denmark extorted large ransoms from the rulers of England. The markings on the coins indicate they were minted in London, York, Lincoln and Canterbury.

The tigers of Korea and Manchuria, the finest of the tiger race, live in the high mountains amid bitter cold and deep snow. They have heavier coats than their jungle cousins farther south.

Canada received 137,681 immigrants in 1923, as compared with 70,153 in the previous year. The first months of 1924 are said to be such that the same rate of increase will be maintained throughout this year.

Experiments made in France, with the object of discovering whether light or heat is the determining factor in the reddening of cherries, indicates that light exerts no direct action upon the process of turning red; heat alone counts in the matter.

Our Individualism—Its Strength and Danger

A Study of Extremes to Which Personal Interest Draws Our People

By ALBERT ERNEST JENKS

Professor of Anthropology, University of Minnesota.

> One would expect that the individualism of America would find expression and interpretation in her literature. We are not disappointed in such expectations. Emerson put his individualism into many epigrammatic sentences of prophet-like force which have had their influence on American thought from his time to ours. Here are a few typical Emersonian expressions:
>
> "If a single man plant himself indomitably on his instincts and there abide, the huge world will come round to him."
>
> "The new man [the American] must feel that he is new, and has not come into the world mortgaged to the opinions and usages of Europe and Asia and Africa."
>
> "[A man] need not study where to stand, nor to put things in favorable light: in him is the light, from him all things are illuminated to their center."
>
> "Be content with a little light, so it be your own."
>
> "Trust thyself; every heart vibrates to that iron string."
>
> ---
>
> "There is no permanent class of hired laborers among us . . . . The hired laborer of yesterday labors on his own account today, and will hire others to labor for him tomorrow. Advancement—improvement in condition—is the order of things in a society of equals," said Abraham Lincoln.
>
> The transformation of the individual or his children from one class or rank to a higher economic, social, or political plane is an ever-present miracle in our American democracy. "Up from the ranks" is a familiar American explanation of the way a successful man has been trained. Literally, it is often true. MacArthur, Funston, Wood, Miles are household names of United States Army officers who never saw the inside of West Point. In 1919, on the appointment of instructors at the General Staff College at Washington, six out of the seventeen chosen were former privates.

ENOUGH has been said of American individualism so that there need be no question of the meaning of the expression, or of the statement that individualism permeates our whole life.

The strengths of American individualism are too patent to need emphasis. The recognition of individual worth and of the right of the individual to self-development is the corner stone of our American democracy. The value of our individual resourcefulness in the formative period of our history cannot be overemphasized.

But there are always grave dangers in excesses of all kinds, so there is in excessive individualism a danger line of disintegration and disorganization beyond which lies ruin.

There are in America today grave dangers which are a logical accompaniment of our extreme individualism. They are products of our individualistic excesses, or of our old individualism still operative in new conditions where it is no longer necessary. In many phases of American life today these dangers strike the observant person squarely in the face. The growing individualism of the man and of the woman in all lines of endeavor; that of the child at home and in school; of the young people in college; the rank individualism of our present-day literature; the fighting individualism of the community, of the city, the section, the religious organization, the class organization, and an extensive catalog of other individualistic lines of cleavage make the thoughtful American ponder.

The Extremes of Personal Privilege

MANY people have seen this danger. Professor Elwood saw it, and said, while "historically the individualistic movement has conferred some of the greatest benefits upon western civilization . . . . yet it must be judged at the same time as perhaps the greatest menace of the present to social order, and so to civilization."

Professor Giddings saw it and made this sweeping statement: "It is useless to deny that our present tendency in the United States is toward anarchy in all those fields of human interest which we have not yet brought under the iron hand of our central government." Roosevelt saw it, and, with the vision of the statesman, wrote his *New Nationalism.*

The individualism which is a necessary part of frontier life, which may fit well a homogeneous people, "shored about by lines of hereditary thought," who for generations have felt and acted alike, has grave dangers when overemphasized by a people rapidly developing a super-urban civilization and composed of heterogeneous groups of many hereditary cultures.

Let us point out some of the most imminent expressions of this dangerous individualism.

First, the emphasis by each individual on his own personal privileges and rights has made us a headstrong people with contempt for law. We are self-willed and defiant of public authority. We think of the laws, if we think of them at all, as made to protect our rights, rather than to curb our desires or our acts. Americans are so little conscious of laws that as individuals in small or larger mobs we too commonly "take the law into our own hands," instead of waiting for the process of established legal procedure. Harry Pratt Judson, president emeritus of the University of Chicago, has said: "Like a scarlet thread through the russet and gold of the fabric of our history runs this proneness to violent remedies in place of the more remote securities of legal process."

The American Bar Association in its annual meeting, 1922, reports "Particularly since 1890 there has been, and continues, a widening, deepening tide of lawlessness in this country. The criminal situation in the United States, as far as crimes of violence are concerned, is worse than that in any other civilized country. Here there is less respect for law."

Individualistic Excess in Lawbreaking

SOME comparisons with other English-speaking peoples may assist us to see ourselves as we are. Recently it was written that "Not for seventy-five years has a mob anywhere in the British Empire taken a prisoner out of the hands of the authorities and put him to death." We do that lawless act literally, or by forestalling the "hands of the authorities," more than fifty times a year in the United States. Again, "there were seventeen murders in London last year, and not one of these crimes was unsolved." During the same period New York had 260 murders and obtained three convictions. It is estimated that 7,850 murders were committed in the United States last year. During 1921 there were 137 murders in Chicago. In the same year, throughout all England and Wales, there were sixty-three murders. In 1917 Los Angeles had ten more murders than London with twenty times the population. There are thirteen times as many murders committed annually in the United States as in Canada, man for man. In the United States a murderer has a greater chance of eluding capture than he has in Canada. If captured here, his chances of acquittal at trial are greater than in Canada. If convicted here, his chances of release from prison, to enjoy long years of liberty, are good.

Today in America we have come upon a period of lawlessness surpassing anything known before. It extends from the man in the street to the man in the underworld. Recently in one of our cities "a squad of seven special police stopped ninety violators of traffic ordinances in just ninety minutes." "The law of the jungle rules the underworld," says the headline of a daily paper in one of our large cities. In that city we are told that there are at least 10,000 places where liquor is sold in violation of the Eighteenth Amendment of the Constitution of the United States. The chances of conviction on a charge involving the liquor laws in that city are said to be 1 in 144.

We have reached in America the danger line of individualistic excess in lawbreaking. Americans have certain "inalienable rights," named in our American "Bill of Rights," the first nine amendments to the Federal Constitution. We have so nursed ourselves on those rights that we have forgotten that every guaranteed personal right carries with it the moral obligation of personal duty to all the laws of the nation which guarantee and protect us in those individual rights. We ask that the Federal Constitution protect us in our person and property, and we violate the provisions of that same Constitution at will.

The government is a covenant. We are breaking the covenant.

The Exaggeration of Personal Happiness

WE ARE not without the words of a prophet to tell us the meaning of such a violation:

> "Let every American, every lover of liberty, every well-wisher to his posterity, swear by the blood of the Revolution never to violate in the least particular the laws of the country and never to tolerate their violation by others. As the patriots of '76 did to the support of the Declaration of Independence, so *to the support of the Constitution and laws let every American pledge his life, his property, and his sacred honor.* Let every man remember that to violate the laws is to trample on the blood of his father, and to tear the charter of his own and his children's liberty."

These are the words of Abraham Lincoln.

A second expression of dangerous individualism in America is the exaggeration of personal development, of personal happiness. Americans are selfish, as never before. Men, women and children alike have become self-centered.

As to the American child—the whole tendency today is toward allowing the child to develop his individual personality. In other words, the tendency and practice is away from discipline and restraint. Discipline of children is out of style in the home and largely out of law in the schools. As a result, or at least as an accompaniment, American children are said to be notoriously the worst behaved children in the world. Recently two groups of grade-school teachers, aggregating slightly more than 200, named for me, and unanimously voted to sustain, the following list of present-day characteristics of pupils, which they believed were the product of exaggerated ego: "Lack of self-control, lack of concentration, disregard of the authority of those in control, lawlessness, selfishness, and disregard of the rights of others."

The individualistic young man and woman of today is this uncurbed selfish child grown older. If the child is never or seldom disciplined, is never or seldom taught to listen and be obedient to reason, seldom taught to respect and obey law, seldom taught to think and act in terms of constituted authority—but is allowed to think and act in terms of its own impulsive, selfish, powerful self, into what sort of a young man or woman will it develop? We find our answer in certain of the young men and young women of today—self-willed, rebellious of discipline, heedless of convention, self-sufficient in their disregard of the ideals and traditions which have developed and preserved the race.

As to the individualistic American woman, with all respect and regard for her manifold virtues, let us go to the very root of the question at once. Instinctively all normal Americans desire the survival of their nation. There is only one way it may survive as an American nation, and that is by the establishment of families by present Americans and the breeding of children by those families. What are the facts? A larger proportion of American men and women are unmarried than ever before. A larger proportion of families are selfishly broken by divorce than ever before. A larger proportion of permanent families are selfishly childless than ever before. This expression of our selfish individualism is fatal to the American nation. The nation needs a new education of all of its women toward the home. Conditions within a nation which cause its young women personally to value "careers" above families and children are suicidal for that nation. Further, conditions which cause any generation more than temporarily to value work, nay, any so-called "unselfish public service," more highly than it values the rearing of children which should be born to it, are silly and ignoble conditions. Conditions which allow men and women with exaggerated ideas of personal happiness to break the marriage bond at will, in disregard of all obligations to society and to their children, are fatal to our nation.

Super-Individualism

IF THE present individualism of America continues to decrease the birth rate, it will not be

"In the long day of days to come"

but it will be very soon that the poet's lines will be true, not only of New York City, of which they were written, but of our country as a whole:

"In the long day when we are done,
And other men these streets shall pace,
No more in thee shall then be known,
Be seen, the face that was 'our own!'"

We need only go to the business world with its unrestrained competition to find the excessive individualism of the American men. One step farther and we see the corporation, or trust, as an expression of super-individualism, seemingly endowed with eternal life.

We find also in the business world various class minorities fighting for the so-called rights of their particular class with little regard for the rights of the people as a whole, consulting only their own narrow desires in deciding courses of action. Individualism in the political world as expressed in the immortal pork-barrel legislation forms the greatest menace to efficient government. Men in the last years have even used political power to make their individual profit out of the very lifeblood of their fellow citizens.

To sum up, in America we are reflecting the universal social mood of the hour—a mood of overemphasized individualism, a perverted craving for independence. In the political world it is showing itself in unprecedented contempt for law; in the economic world in our unprecedented competitive materialistic struggle; in art, it is called impressionism; in poetry, it is free verse—free alike in form and subject matter; in philosophy, it is the new psychology of self-will; and in ethics, it is the doctrine of self-expression, with its revolt against the old-fashioned words "right" and "wrong." The logical end of all this is anarchy.

We Must Have a New Individualism

WHAT will the outcome be in America? Up to what point, asks Ferraro, the Italian historian, may man aspire to liberty in every department of life, without endangering in the long run the most precious fruits of his conquest? Are our citizens to continue in contempt for law and in defiance of constituted authority until we arrive at the point of anarchy? Are we to continue to emphasize individual development and happiness and so-called self-expression as the chief goal of existence, until we have disorganization in family and community? Are we to continue to magnify unimportant minority rights until we have disintegration in religion and society?

The American people are at the parting of the ways. America must make a new interpretation of our undying individualism. We must have a *new individualism.*

Alan Seegar, the young American poet who died on the battle field of France, will be best remembered by his poem, *"I Have a Rendezvous With Death."* In another poem, *"A Message to America,"* he considers it not impossible that America might yet be conquered by another people—

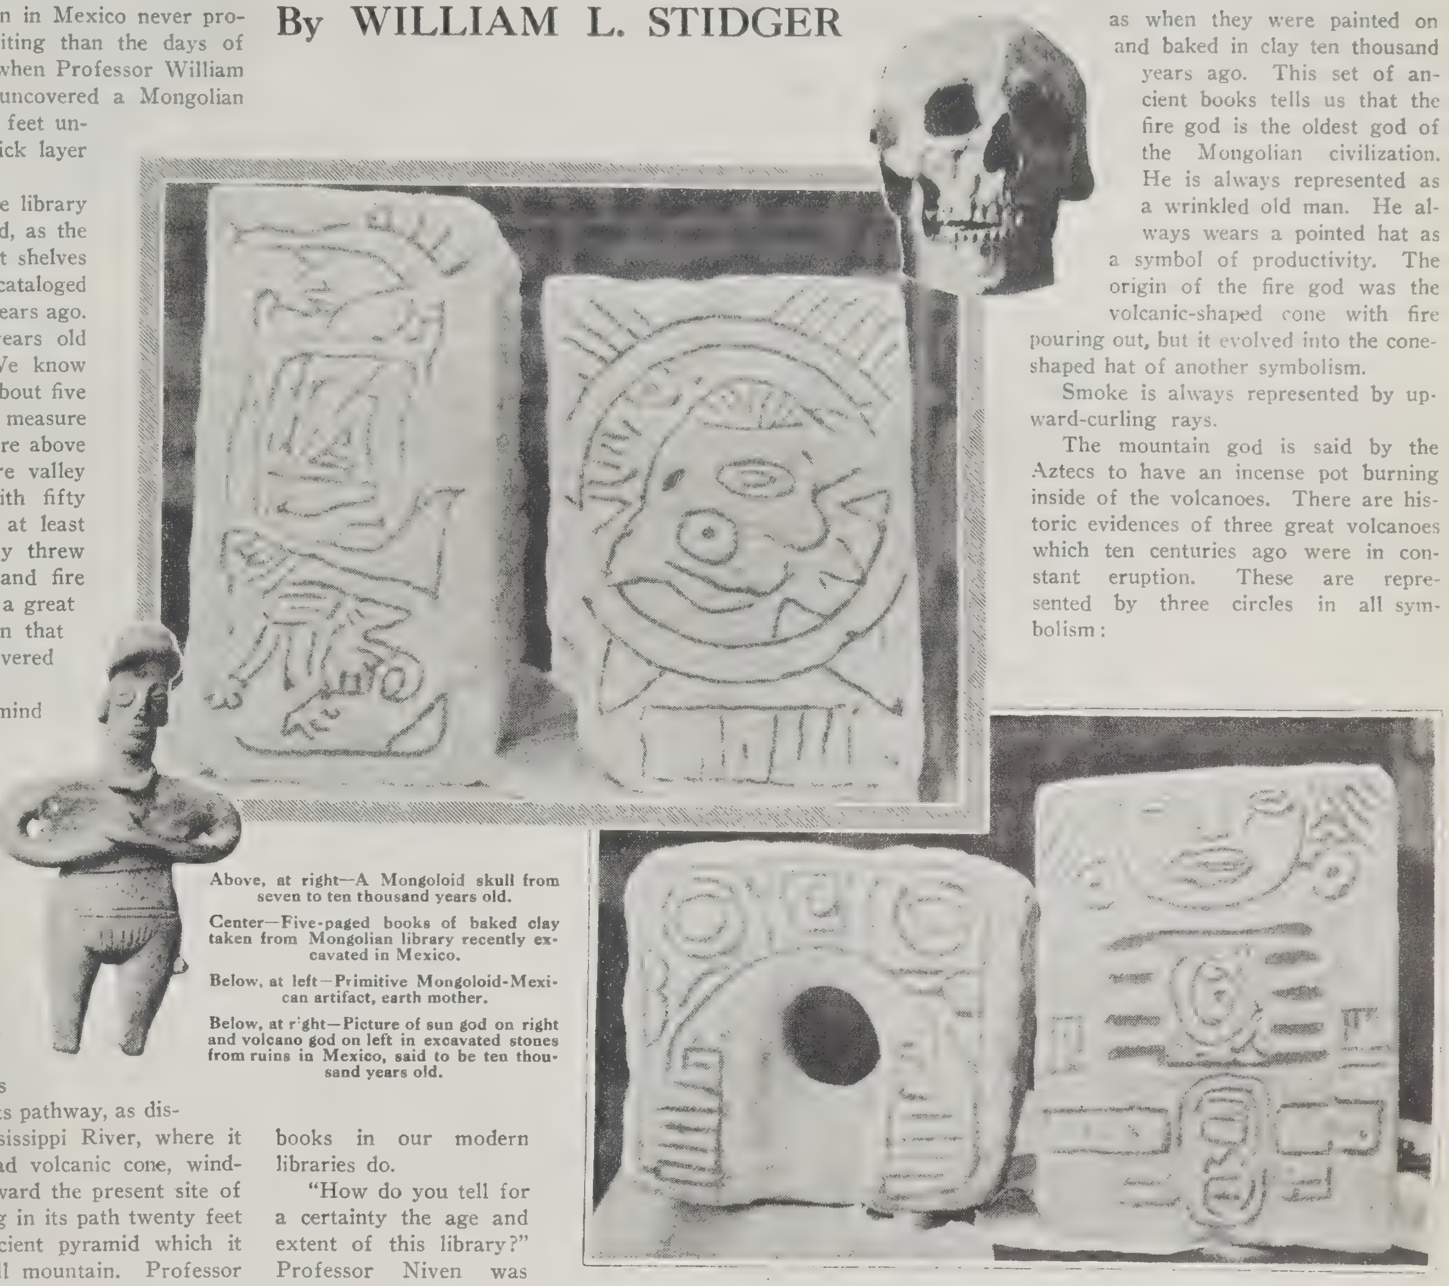
"Sobeit a people that comprehends
The limit where private pleasure ends and
Where their public dues begin.
A people made strong by discipline
Who are willing to give—what you've no mind to—
And understand—what you are blind to—
The things that the individual
Must sacrifice for the good of all."

(Concluded on page 14)

Library 7,000 Years Old Unearthed in Mexico

Represents a Mongolian Civilization Antedating the Toltec Race

By WILLIAM L. STIDGER



Above, at right—A Mongoloid skull from seven to ten thousand years old.

Center—Five-paged books of baked clay taken from Mongolian library recently excavated in Mexico.

Below, at left—Primitive Mongoloid-Mexican artifact, earth mother.

Below, at right—Picture of sun god on right and volcano god on left in excavated stones from ruins in Mexico, said to be ten thousand years old.

THE days of the Revolution in Mexico never produced anything more exciting than the days of July of this past summer, when Professor William Niven and Dr. J. H. Cornyn uncovered a Mongolian library, from ten to twenty-five feet under the earth, just beneath a thick layer of volcanic ashes.

"How old would you say the library is?" Professor Niven was asked, as the pieces tumbled out from perfect shelves where they had evidently been cataloged and placed many thousands of years ago.

"At least seven thousand years old and possibly ten thousand. We know that the volcanic deluge came about five thousand years ago, for we can measure that by the various strata that are above the volcanic debris. This entire valley was a great volcanic cone with fifty active volcanic mountains, and at least three of these giants constantly threw out streams of lava and ash and fire which inundated this valley like a great flood. It was at that inundation that this prehistoric library was covered and the attendants buried."

To the average American mind this seems hard to believe. The prehistoric pyramid near Mexico City is so old that it has no ornaments on it at all. It is just a great, crude pyramid of rough masonry without a sign of cement to hold together the stones with which it is built. They are laid, stone upon stone, but they have stood through ten centuries or more. When I visited this pyramid they showed me a stream of lava which is twenty feet deep. You can see its pathway, as distinctly as you can see the Mississippi River, where it flowed forth from the now dead volcanic cone, winding its way down the valley toward the present site of Mexico City, covering everything in its path twenty feet deep until it came to this ancient pyramid which it surrounded as it would a small mountain. Professor Cummings has dug down through this layer of volcanic lava to the bottom of the pyramid, which is ten feet below the lava stream. As to the age of this pyramid, scientists know that the volcanic upheavals must have come at least seven thousand years ago, and the pyramid was erected centuries before that. Human skeletons are found both beneath and imbedded in this lava stream.

So it is with the library that has just been uncovered by the archeologists. They know that it is at a depth beneath the lava ash and debris, although no stream of lava came this way.

The books are tablets, just as the books of the libraries of ancient peoples have always been. These tablets are of all sizes. They have their writings on five sides of a stone. Some of the books are crude and some of them show a high degree of stone-book-making skill. They range over a long period of time, just as the books in our modern libraries do.

"How do you tell for a certainty the age and extent of this library?" Professor Niven was asked as we watched the men digging out piece after piece with ancient hieroglyphics telling the story of the past.

"Because we know certain letters and signs and figures. They are stable and certain. We have established them scientifically."

"What are some of these signs that you know for a certainty?"

"There are more than two hundred symbols that we can recognize in this library. We recognize the symbol of the moon, the symbol of fire, the earth mother, water, lightning, the sun's rays, the symbol of the volcano god, the symbols of morning and evening, the symbols of the various stars and heavenly bodies, of which the people of that period knew much. Many of the books of this Mongoloid library are books on the stars. They knew the heavens."

"When did this Mongolian civilization which left behind it this tremendous library exist?" these men were asked.

"Many centuries before even the Toltec or the Aztec races."

In this excavated library of the Mongoloid civilization that preceded both the Toltec or Aztec civilizations, a conventional flower is the sign which represented fire; a half circle with a concentric circle, represented either the rising or the setting sun; a cross represented the four movements of the sun.

Mythical animals appear in this library and they are always connected with the fire and sun signs.

The sun is always shown in yellow or orange.

The fire is always shown in a deep red.

The water symbol is always in green or blue.

The morning symbol is always white.

Each day new books from this library are being unearthed, and they have these symbols and stories still intact; perfect specimens, with the colors still as brilliant as when they were painted on and baked in clay ten thousand years ago. This set of ancient books tells us that the fire god is the oldest god of the Mongolian civilization. He is always represented as a wrinkled old man. He always wears a pointed hat as a symbol of productivity. The origin of the fire god was the volcanic-shaped cone with fire pouring out, but it evolved into the cone-shaped hat of another symbolism.

Smoke is always represented by upward-curling rays.

The mountain god is said by the Aztecs to have an incense pot burning inside of the volcanoes. There are historic evidences of three great volcanoes which ten centuries ago were in constant eruption. These are represented by three circles in all symbolism:

O..........................O..........................O
sun god..........................volcano god..........................fire god

This symbolism came down from the Mongolian civilization up to the Aztec times.

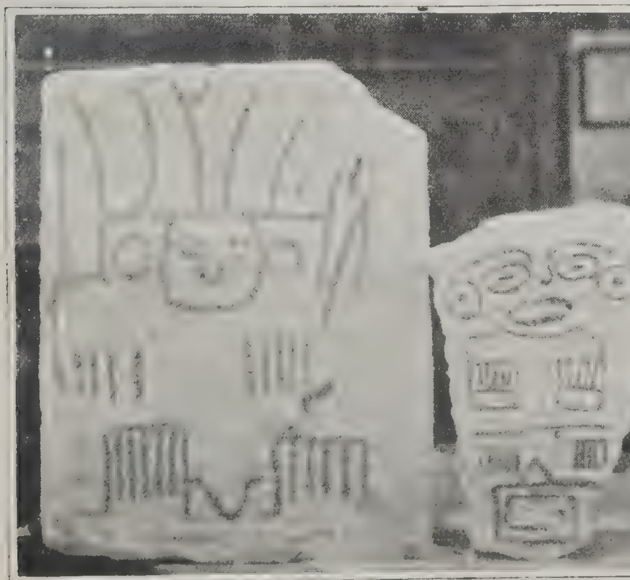
One conventional type of a deep dish is found constantly in the ruins of this great Mongolian library which is being dug up by Professor Niven. It is a great incense dish. Symbolically it represents the Mexico Valley. On the edge of this dish are three volcano gods, each with a hole through his body coming out of the top of his head. In this hole the ancient peoples burned their incense to this volcano god. These three volcano gods were the three great volcanic mountains that at that time were in constant eruption.

This library shows that the various pyramids that were erected in the valley also represented worship of the volcano gods. They are shaped like a volcano and the chief method of worship was to build fires on the tops of these pyramids and keep them burning for fifty-two years, which was the century of these ancient peoples. It was on top of these pyramids that human sacrifices were made to the volcano gods long before the Aztecs came along with their human sacrifices.

In addition to the books that have been unearthed from the shelves of this ancient library, architectural drawings have been dug up by hundreds.

Careful analysis and study have shown that these are drawings of the pyramids and temples. They are on baked clay which is so hard that it is impregnable even by the digger's pick. They are from sixteen inches to eleven inches in surface and two inches thick.

They are drawn by the architect in colors and show each dimension and floor of the various pyramids and temples. One drawing shows four gables with pointed peaks, four terraces on each side and end, but no entrance. The Pyramid Temples in these days had no entrance. They were approached by ladders like the cliff dwellers and when entrance was gained these ladders were drawn up for safety's sake. In later days, stone steps were installed by the Aztecs.



Part of the Mongolian library excavated recently near Mexico City.

The Tailor-Made Cigaret and Forest Fires

An Indictment Against the Careless Smoker; Camper and Tourist Are Also to Blame

By JOHN M. ROBERTSON

"NOTHING doing" to lessen forest fires, has been implied by the rebuffs which the cigaret manufacturers have administered to the United States Forest Service, the National Board of Fire Underwriters and large timber owners.

Smokers were responsible for 17.41 per cent of all fires on the national forests in 1922, the latest year that has been fully reported, and campers followed with a record of 13.22 per cent. Lightning caused most fires, 36.44 per cent, only 5.81 per cent in excess of both smokers and campers, however.

A Canadian tobacco company, reflecting the public spirit that distinguishes our northern neighbor, has been inserting in each package of cigarets a red slip bearing this caution:

> "Please don't throw away a lighted cigaret. See that it is dead out.
>
> "Lighted tobacco and matches are especially destructive in the forests.
>
> "Living forests mean liberal employment; dead forests employ nobody.
>
> "Don't be responsible for a dead forest.
>
> "This caution is printed as a contribution to the forest conservation movement."

Americans seeing these little red slips have wondered why similar action has not been taken by cigaret manufacturers in the United States. The United States Forest Service did undertake to lay the value of such co-operation before them, but only one concern responded and its interest has since been relinquished.

Later the National Board of Fire Underwriters addressed thirty-five leading tobacco manufacturers with the same idea in mind, but its suggestion has been ignored. The Pacific Coast Logging Congress and leading southern timber men also were treated to silence when they protested against the cigaret danger to our remaining forests.

Why a tailor-made or machine-made cigaret should be held responsible for forest fires and the "roll-your-own" type be passed over has doubtless become an inquiry in many minds. It is easily answered.

The paper wrapping of machine-made cigarets is treated with potash salts or other mineral salts to insure high combustibility and even burning, whereas ordinary papers used for hand-made cigarets are not so treated.

Most machine-made cigarets are made of a blend in which Turkish and other foreign-grown tobaccos enter. These tobaccos are naturally more combustible than the straight Virginia and Burley tobaccos which are ordinarily used in "rolling your own." Hence the ordinary machine-made cigaret is much more free-burning than the hand-made one. There are many kinds of tobaccos that naturally contain saltpeter. It is a property of the tobacco itself, and it is these tobaccos that enter into the blends used much more generally for machine-made cigarets than for hand-made cigarets.

Lastly, there is the degree of looseness with which the cigaret is rolled. Machine-made cigarets are usually rolled tightly and firmly, whereas most hand-made cigarets are rolled loosely.

"The tailor-made cigaret and the unextinguished match continue to be the greatest enemies of our forests," said District Forester Paul G. Redington, of the United States Forest Service in California.

The gray hairs of faithfulness.

"It is surprising also to note the number of fires started by campers," he continued.

Forester Redington added this warning, since confirmed by drastic action:

"The forest service would regret exceedingly to have to issue orders restricting the public use of our national forests, which cover the greater part of the mountain region of the state and constitute a most popular playground.

"But if such action is taken, the public will have only itself to blame. One thing is certain; we have to reduce the number of man-caused fires, and if educational methods fail to produce the desired results, the government is prepared to take more stringent measures."

Now comes word that the Palm, Andreas and Murray canons in California have been closed to campers because of the fire hazard, the pollution of water and their failure to remove their rubbish. Palm canon is one of the most beautiful spots in the West.

Forests in Profile or Franconia Notch, New Hampshire, location of famous "Old Man of the Mountain," were set on fire when summer hotel burned in autumn of 1923. While the fire was prevented from sweeping the forests it evidences the risk of summer hotels and camps to forests.

More than 4,250,000 persons visited the national forests of California in 1923, and 475 smokers' and campers' fires occurred there. Forest officers in California obtained convictions of one hundred and twenty violators of state and Federal fire laws last year.

It was once the rule to wink at violations of the state and Federal game laws. Now the game hog is looked upon as a common lawbreaker. Public

Forest fires spread with incredible rapidity. Picture of Mt. Echo, California, fire, taken within ten minutes after fire started.

opinion must likewise be mustered against careless and ignorant smokers and campers.

District Forester Cecil, of Portland, Oregon, confirms Forester Redington by declaring: "The fact that careless smokers do not kill their cigaret stumps before throwing them away and that the stumps of tailor-made cigarets hold their fire after being tossed aside is undoubtedly responsible for a large majority of our forest fires due to smokers."

Paul B. Riis, president of the Superior National Forest Recreation Association, in a stirring appeal for increased Federal forest service extension of what he described as the only real bit of wilderness in Mid-America, makes this moving reference to forest fire ravages:

"Erstwhile highland lakes, indescribably beautiful and primeval wilderness are now huge burnings, a blackened devastated barren, an inferno of rocks and snags and utter desolation. Soils have been eaten away by the greedy tongues of all-consuming flames and have become but a sterile desert of rocks useless from whatever standpoint. Wild life avoids these regions, humans sidestep them and the sun and winds work their wills upon them relentlessly . . . ."

Inexperienced visitors to the forests frequently disregard the fact that the forest floor is made up of a mat of leaves, bark and decomposing dead trees, all termed "duff," which often is mistaken for the earth. A lighted cigaret or match cast into this duff may smolder for days or even weeks and then break out into an open fire. Campers should be scrupulously careful to clear away a large space in the duff *down to the ground or rocks* before building fires. These fires should be small and carefully extinguished with water and earth before leaving even but for a few hours. The state and Federal forest services are perfecting their means of promptly detecting the causes of such fires. More and more often these visitors who abuse their privileges are being haled into the courts and severely punished.

Here is the sad record of what happened when the duff got on fire. It was one of the worst forest fires in New York State.

In April, 1903, a farmer burning over a field near Lake Placid permitted the fire to get into the duff of an adjoining forest, where it smoldered until the third of June. Then an unusually strong wind fanned it into a surface fire which traveled eight miles in two and a half hours. It leaped clearings and streams. At times it proceeded through meadows, making a path a few feet wide and then, driven by the wind, burst into a roaring conflagration which in a few hours devastated a tract of forest land six miles long and three miles wide.

Fourteen thousand acres were burned over, the famous Adirondack Lodge on Heart Lake was consumed, the total loss being estimated at more than $150,000, comparable with a present-day loss of about half a million dollars. For more than a generation the public enjoyment of the south end of the beautiful Lake Placid Valley has been limited because of the destruction of what was declared to be the finest stand of primeval forest in the eastern states.

The significance of the forest fire losses which are accentuated by cigarets and careless campers is seen in the startling record of America's annual losses.

Each year the forest fires destroy or damage timber of sufficient amount to build five-room houses for the entire population of a city the size of San Francisco.

An area equal to a ten-mile strip reaching from New York to Denver, or more than eight times the acreage of French forest destroyed during the World War, is burned over by forest fires in this country every year.

Regarding the preventive measures being employed to stay this appalling rate of loss, the following is of importance:

The Federal and state governments and private interests spend about three million dollars a year for forest fire protection. W. B. Greeley, chief of the United States Forest Service, believes that if ten million dollars were spent each year, our fire loss of timber could be practically eliminated.

Since the average fire loss of timber is about sixteen and a half million dollars, the proposed expenditure would return a net profit of sixty-five per cent without figuring the values involved in the conservation of water supplies, recreational and other uses.

The Federal Government spent $607,200 in 1922 in fighting fires on the national forests where the losses were kept down to $493,965 and 373,214 acres were burned over. It also co-operated with the private owners of adjacent forests who deposited funds for the protection of their forests to the extent of $128,000.

The Federal Government makes available for protection from fire in co-operation with states the forested watersheds of navigable streams the additional sum of $400,000 and in 1923 the co-operating states added $1,826,430 to this fund. The summary of all forest fires throughout the country in 1922 gives their number as 51,891 with 8,194,189 acres burned over and a loss of $16,678,485.

Tangible evidence of the new tendency of America to keep house in a self-respecting manner is found in the fire lookout houses on mountain tops and observation towers throughout the forested regions. They are as dramatic an evidence of a guarded public domain as were the scattered presidios of the Spanish conquerers of the Southwest.

The Federal forest service has one hundred and ninety-four of these watch towers and an additional two hundred and twenty-four are desired for primary lookout purposes. These lookout stations and the rest of the forest service are connected by a telephone system of 28,896 miles. It should be supplemented by the construction of 8,599 miles of new line to provide a reasonably adequate communication system for fire purposes.

The thousands who annually scramble up to the summit of Mt. Whiteface at Lake Placid in the Adirondacks have become initiated in the methods used by these lookout tower observers.

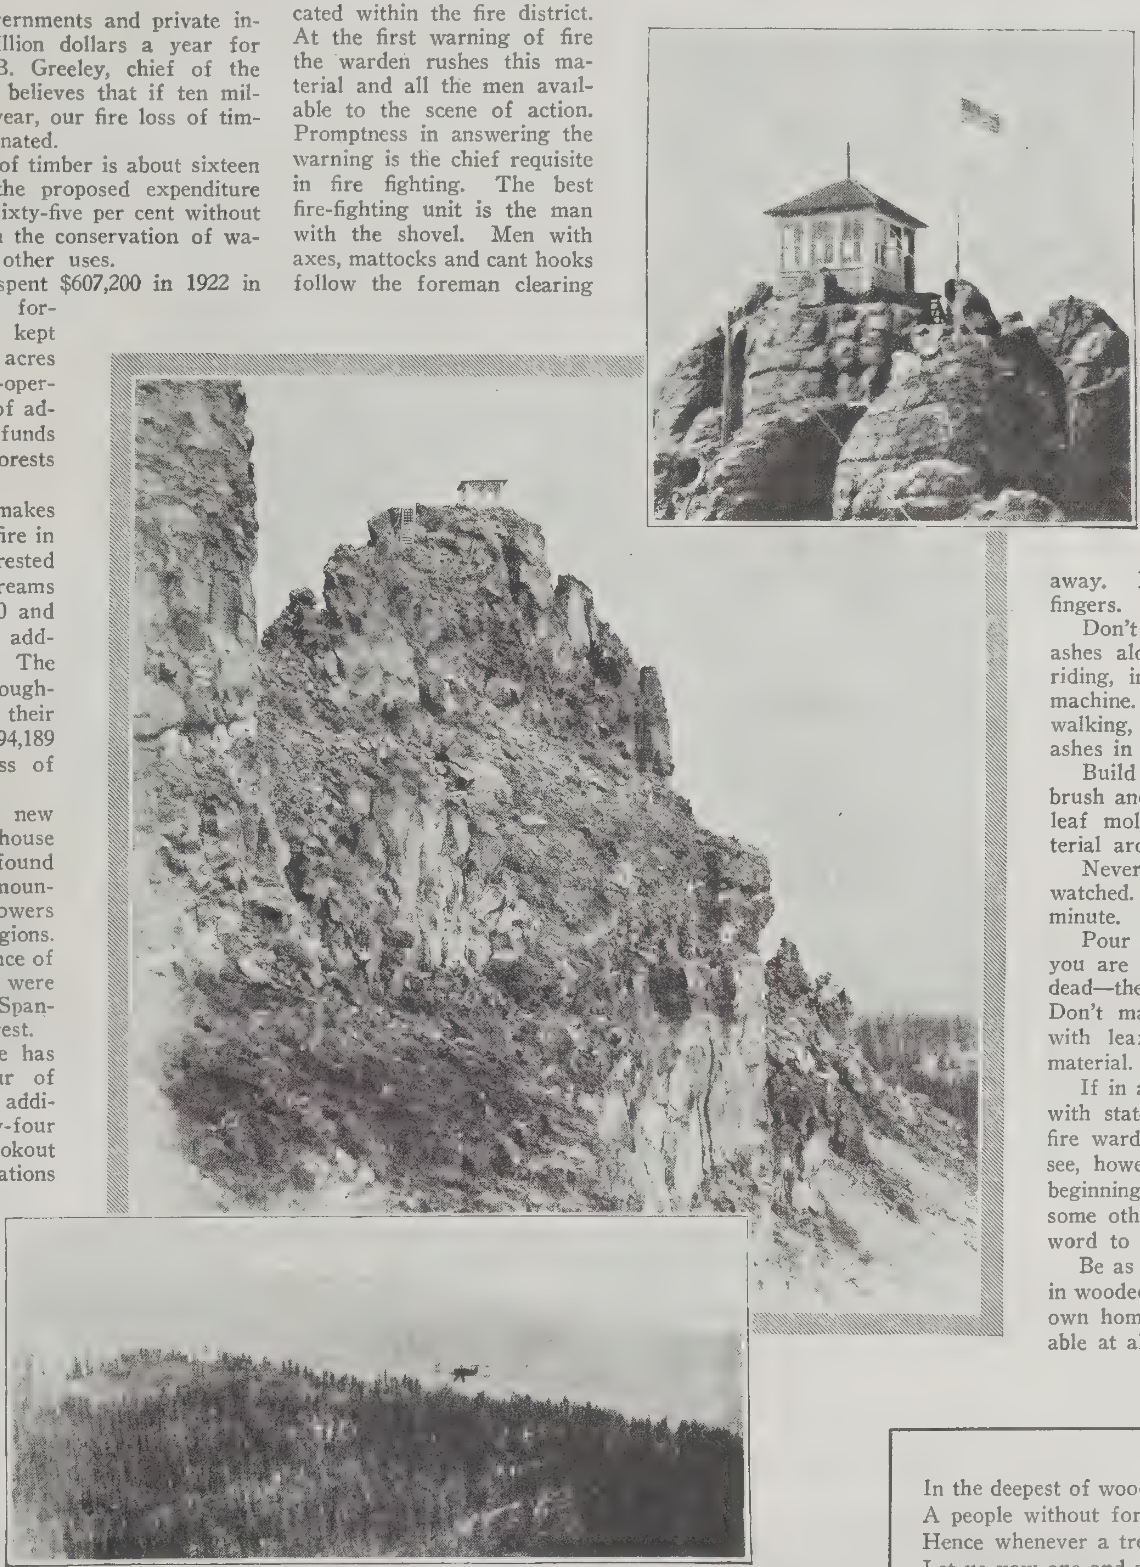
During the years 1919-1922 appropriations were made that enabled the army air service to co-operate with the forest service in maintaining an aerial patrol of the forested regions in California and Oregon. It was discontinued last year, first, because of Federal budget economies and, second, because of the conclusion of the forest service that regular daily patrol by airplanes does not yield sufficient results to justify the cost.

Nevertheless, airplanes have an important place in fire control. The chief forester advocates such patrol stations a few hundred miles apart throughout California and the Northwestern states. When fires grow large, a reconnaissance from the air is a very useful method of securing vital information. Smoldering fires started by lightning can be searched out by planes after bad electrical storms. Systematic fire patrol may be very important for a few weeks at a time when a smoke blanket renders fire detection from stationary lookouts on mountains ineffective. From selected points an average of from twenty-five to fifty flights a year would be an important adjunct to the other available means of controlling fire on the national forests.

The lookout system is constantly operative and the aerial service must be supplementary. While the detection of forest fires has been mentioned, this must be supported by the fire-fighting organization. Years of search have failed to disclose any simple or easy road to mastery of the problem of fire control in American forestry.

Control of summer fires begins the preceding autumn when a scattered forest personnel must analyze the results of the fire season then closing and learn the lessons it has taught. During the winter plans for dealing with equipment are made, educational work done among the public and the interest of large timber owners aroused. The spring sees the government repairing the telephone lines, placing tools and equipment at convenient points. The guards are schooled and sent out to the lookout peaks and the guard stations.

Fire-fighting tools, such as shovels, axes, mattocks and, in well-watered regions, force pumps with extension hose, are centrally located within the fire district. At the first warning of fire the warden rushes this material and all the men available to the scene of action. Promptness in answering the warning is the chief requisite in fire fighting. The best fire-fighting unit is the man with the shovel. Men with axes, mattocks and cant hooks follow the foreman clearing a wide space through the underbrush, chopping out dead and inflammable material and clearing the way for the shovel men. The men with shovels follow through, turning the soil over, making a sandy fire line which turns the flaming terror away from valuable standing timber or homes, into old burned slashings, lakes or rivers. Back fires set from shoveled fire lines will meet the onrushing flames and harmlessly burn themselves out to windward of the safety lines.



Above—Fire lookout station on the Harney National Forest in South Dakota. Center—Lookout station on Castle Peak in the Holy Cross National Forest, Colorado. Below—Airplane on patrol over Umpqua National Forest, Oregon.

No one is spared when fighting fire. Women, children and the aged join against the common enemy. Tourists are taken from their automobiles and impressed into the service, the men handed shovels and axes, the women cooking food and carrying water and food to the fire fighters, many of whom have been on the line for days and nights, continuously breathing the hot, acrid atmosphere and choking over the pungent burning evergreens. Severe penalties are imposed on those able-bodied persons who for any reason seek to avoid service. Courts in the fire districts deal harshly with them, and justly so.

In the mountainous districts of the West the deep coulees act as chimneys and with a powerful wind behind a fire, aided by the natural "draw" of the ravine, there is nothing man can do to prevent the total destruction of every living thing in the path of the roaring flames. Dead timber, standing green timber, game birds and animals are reduced to ashes. The roaring of the flames may be heard for miles and the fleeing animals run terror-stricken through the forest, the deer and the cougar running side by side in mortal fear of the common enemy close behind them. The heat becomes intense and great rocks outcropping from the earth are shaled and broken in the trail of the all-devouring fire. Creeks are dried up almost instantly and the larger pools become so heated that the fish float dying to the surface. The sun is obscured in the heavy pall of choking smoke, burning brands are tossed upward by the heat waves where the higher currents of air carry them far in advance of the main conflagration setting new small fires which in turn soon become roaring terrors devouring everything with which they come in contact.

Millions of people are now making their first contact with the wild wooded areas of the nation. Perhaps it is but natural that they should make mistakes and heedlessly cause fires. However, it is just as bad form to throw an unextinguished match or cigaret on the forest floor as it is to do the same thing on your host's rugs.

Here are simple rules which if observed will go far toward reducing the appalling loss of life and timber in the forests:

Be sure your match is out before throwing it away. Break it in two with your fingers.

Don't throw cigars, cigarets and pipe ashes along the roadside. If you are riding, improvise an ash tray in your machine. A tin can will do. If you are walking, grind your stubs, matches and ashes in the dirt.

Build small camp fires away from brush and small trees. Scrape away all leaf mold and other inflammable material around your fire.

Never leave your camp fire unwatched. A wind may spring up any minute.

Pour water on your camp fire when you are finished with it. Be sure it is dead—then bury it with dirt or gravel. Don't make the mistake of burying it with leaf mold or other inflammable material.

If in a wooded region, keep in touch with state or Federal forest ranger or fire warden. Report all fires you may see, however small. If you see a fire beginning to burn, stop and fight it while some other member of your party gets word to the ranger or fire warden.

Be as careful with fire while you are in wooded areas as you would be in your own home. Be thoughtful and reasonable at all times.

In the deepest of woods the nation keeps its heart;
A people without forests is a people that dies,
Hence whenever a tree succumbs,
Let us vow one and all to plant a successor upon
its tomb,
And let us vow to reforest the denuded wastes
Where quick-rising floods swell into torrents
And the mountain sides are bitten bare by grazing
sheep
And the rocks thrust forth like Nature's bones.
And may our children behold in future seasons
The robust branches of oaks and pines
Sway o'er the plain and flaunt their fleecy foliage
in the air
Like the fruitful tossing waves of the sea.
—Andre Theuriet.

I know a forest vast and old,—
A shade so deep, so darkly green,
That morning sends her shaft of gold
In vain to pierce its leafy screen:
I know a brake where sleeps the fawn,
The soft-eyed fawn, through noon's repose;
For noon with all the calm of dawn
Lies hush'd beneath those dewy boughs.
—Edith May

Old Beecher Church—Brooklyn's Landmark

Scene of Thunderous War-Time Eloquence by the Shakespeare of the Pulpit

By CHARLES ALBERT COLLMAN

WHAT Old South is to Boston, and Independence Hall to Philadelphia, Plymouth Church is to the city of Brooklyn. The old meeting house, partly covered with ivy, and without a steeple, is distinctive in having preserved the simplicity of the typical New England Congregational church. From every part of the country thousands make annual pilgrimages to Plymouth Church, and scarcely a month passes without a score or more travelers from foreign countries visiting Brooklyn in search of Beecher's grave, for the church and the memory of its famous preacher are still inseparable.

Photos by Paul Thompson

Left—HENRY WARD BEECHER. Above—Plymouth Church, Brooklyn.

The ground upon which Plymouth Church now stands was bought in 1823 for the erection of the First Presbyterian Church at a time when Brooklyn had a population of fewer than 10,000 persons. This congregation eventually moved to larger quarters, and the property was bought by a group of men interested in establishing a new Congregational church. On Sunday morning, May 16, 1847, they opened the meeting house in Cranberry street for religious worship. Henry Ward Beecher, then pastor of a Presbyterian church in Indianapolis, had visited New York at this time at the request of the American Home Missionary Society to make a public address at its anniversary. He made other addresses of a similar nature during the second week in May, and had thus become well known to the public. He was invited to preach at the opening of the new Congregational meeting house, and accordingly preached both in the morning and evening to audiences which crowded every part of the building.

On June 13, 1847, the meeting house was publicly organized under the corporate name of "The Plymouth Church," and on the following day the church, by a unanimous vote, elected Henry Ward Beecher to be their pastor. On the very first Sunday (October 10, 1847) upon which the pastor occupied the pulpit, the church was about three-quarters full in the morning, and entirely filled in the evening. This continued to be the case for about four months; after which the building was generally thronged both morning and evening. There was a frequent recurrence of revivals, particularly in the years 1849, 1852, 1855, 1857, 1858, 1862, 1865 and 1866.

The original buildings consisted of a church fronting on Cranberry street, and a lecture room facing Orange street. In January, 1849, the structure was so seriously damaged by fire, that the society decided the church should be rebuilt entirely. The corner stone of the new building was laid in May, 1849, and was occupied by the congregation on the first Sunday in January, 1850. The form of the auditorium and the arrangement of the pews were innovations at that period, and they were followed in many other church edifices. The building seated in the pews and choir gallery about 2,100 persons, while with seats by the walls and in the aisles, it accommodated about 2,800. Few churches ever give or have given so genuine a welcome to all comers as Plymouth. No man, woman or child, rich or poor, high or low, in visiting the meeting house, was ever made to feel out of place.

Henry Ward Beecher was an extraordinary reader, even in his rendering of a hymn or a chapter from the Bible, and during the prayer there was a tense stillness throughout the church. The sermon was awaited with a sort of breathless conviction that "something was coming." Sometimes it was so humorous as to provoke laughter, at other times the words were delivered with a tensity that made the hearers quiver or become spellbound with attention, while again it was a calm, quiet, but forceful presentation of some truth. It has been said of Mr. Beecher that his power of intense sympathy made it easy for him at the time being to impersonate almost any character; delicate shades of meaning came out in the slightest tones of his voice.

Plymouth Church was born in days of strife, and during a period of great political ferment. The war with Mexico was followed by the anti-slavery agitations, and then came the Civil War. The three pastors of the church have ever been militant. Mr. Beecher proved his great powers as an orator when he went to England in 1863, to address large mass-meetings in Liverpool, Manchester and London. So strained were the political relations between Great Britain and the United States, that Mr. Beecher was met with a bitter wave of hostility, and huge posters were displayed, denouncing his "cruelty and impiety." So inflamed was the public mind against him, that when he arose to speak, the hisses and general uproar made it impossible for him to be heard. He calmly faced the storm for an hour to an hour and a half before his audience would listen. The slowly quieted mob gradually paid attention to his words, fell under the influence of the speaker's spell, and in the end applauded him with greater tumult than that caused by the groans and howling with which he had been first received.

During the pre-war days, while speaking at the Broadway Tabernacle, located near Duane street, to a packed house which was listening to him with the intensest interest, Mr. Beecher, at the climax of his address, turned around and lifted a chain that had been taken from a slave in the South, held it aloft for a moment, and then dashed it to the floor, placing his foot upon it, and saying: "In this way we purpose to deal with the slave power in the South." The audience, entirely carried away, rocked the building with applause.

In the days of Beecher's popularity, tourists visited Plymouth Church just as they went to Washington, or to see Niagara Falls. Noted men and women from all parts of the world were to be met with in the congregation, statesmen, generals, well-known editors. Among those who went to hear Plymouth's great pastor were Abraham Lincoln, Louis Kossuth, General Grant, Charles Dickens, Wendell Phillips, Horace Greeley, Whittier and Charles Sumner. During the Civil War, the church was visited by most of the so-called war governors—Andrews, of Massachusetts; Buckingham, of Connecticut; Curtin, of Pennsylvania, and Morgan, of New York. New England regiments, marching on their way to the front, frequently stopped over in Brooklyn on Sundays and marched to Plymouth Church.

When President Lincoln became convinced that the North had won the conflict, he determined to celebrate the event by raising over Fort Sumter the same old flag that had waved above it before the war had begun. Mr. Beecher was selected to deliver an oration on that occasion, and his address, which was delivered April 14, 1865, has taken its place in the list of memorable addresses delivered on great occasions.

Plymouth was never what may be termed a wealthy church, but many men of influence identified themselves with its life, among them General Horatio C. King, Professor Rossiter W. Raymond, "Deacon" Stephen C. White, John Arbuckle, Henry Hentz and Horatio B. Claflin, founder of the H. B. Claflin Company. Among noted musicians who were engaged for Plymouth Church were Zundel, Burnet, Stebbins, Wheeler, Thursby, Toedt, Sterling, Lasar, Damrosch, Werrenrath and Camp. John Zundel was Beecher's favorite. The great preacher loved old-fashioned hymns, and encouraged the entire congregation, strangers as well as members, to sing, and this custom undoubtedly had its share in ridding the service of any vestige of formality.

In the years 1874 and 1875, Plymouth Church and its pastor were called upon to undergo a trying ordeal, when Mr. Tilton charged the pastor with having alienated his wife's affections. An investigation of these charges by practically the entire resident membership of Plymouth Church ended with a vote of entire confidence in the pastor. A civil trial resulted in a disagreement, but the principal lawyer for the prosecution and the presiding judge publicly expressed their belief in Mr. Beecher's innocence. Plymouth Church then called a council of Congregational churches to review its action regarding its pastor, and this council, consisting of more than 240 men from every part of the country, comprising nearly every phase of theological belief, closed its sessions with a reaffirmation of Mr. Beecher's innocence, none of the charges having been sustained by any proof.

It is difficult today to measure the scope of tremendous influence that Henry Ward Beecher exerted during his lifetime. Abraham Lincoln said of him: "Mr. Beecher was asked to raise the flag at Fort Sumter because, but for his speeches in England, there might have been no flag to raise." "No such eloquence has been heard since Demosthenes made his plea against the tyranny of Philip," was a view expressed by Dr. William Taylor, and Spurgeon termed him "the Shakespeare of the Anglo-Saxon pulpit."

In a sermon devoted to the memory of Mr. Beecher, the Rev. Dr. Newell Dwight Hillis, present pastor of Plymouth Church, said of him: "In hymnology he founded the first of the great song books. His lectures to young men have been translated into twenty foreign languages. He sowed and reaped in many fields, he lectured often, but his pulpit was his real throne. He was an editor and strengthened one great journal, *The Independent,* and founded the *Christian Union.* He became tongue for the dumb and voice for the Indian, the Chinese and the Negro. He lived three and seventy years through the most tumultuous career of our history and forged many a thunderbolt against iniquity."

When Mr. Beecher died in 1887, forty years after he had been identified with Plymouth Church, the urgent question arose as to who could take his place, and whether it would be possible to find his successor. The selection fell upon Dr. Lyman Abbott, who had been associated with Plymouth Church for many years, had gone to it as a boy, and had later been intimately associated with Mr. Beecher. In fact, the lives of these two great preachers had run parallel

(Concluded on page 10)

Mr. Ford's Page

IT IS rather a chastening experience to read in foreign newspapers the reports of looseness and corruption in the United States. It is difficult to know just how anything will appear, until you see through the eyes of outsiders. To detach oneself in mind from this side of the world, and in mind take up one's stand on the other side of the world, is to catch something very like a gasp of fear that the American Republic is showing signs of moral decay.

Of course, it isn't that. Dangerous veins in our common life have cropped up on the surface in too close proximity to the Federal Government, that much is true. And it may be that since the cruder methods of bribery and coercion are no longer practiced, other more insidious ones have taken their place; but nevertheless it is true that most of the harm done the nation today is done honestly, and our main troubles are not traceable so much to criminality as to ignorance.

The impression is borne in more strongly the more one observes the events of the times, that there is a great need for the Americanization of Americans. It was good and necessary work to undertake the Americanization of the alien-born and alien-minded within our borders, to teach them our common language and at least give them the names of some of our common ideals. But the sad fact remains that many of the qualities which we were trying to Americanize the alien-born away from, were qualities which they had picked up in this country and heartily adopted under the impression that they were American qualities!

WHEN we Americanize Americans it will be a much simpler matter to Americanize the alien in our country. Some of the qualities which are scheduled to be Americanized out of the alien are qualities which he has picked up in America under the impression that they were strictly American and proper. This could not have occurred had Americans been truly American. Americanism is neither national nor international, it is universal. We are not making mere nationalists when we Americanize people, we are making them agents of the universal principle of civilization. People who decry the American principle in favor of so-called internationalism have partly seen the hoax of a narrow nationalism, but they have not seen the dangerous fallacy of what passes for "internationalism." The nearest approach to international principle in the world today is the American principle.

Indeed so many un-American tendencies have come to power among us that we have practically ceased in public speech to recite the glories of Free America. It has been felt that the gulf between what we say America is and what it really is, is too wide to be bridged by speech. In the old days there was a great deal of oratory of the Fourth of July order. Mingled with it was much inspirational counsel to young people, that this was the land of glorious opportunity which could not fail to recognize and reward ability and industry and honesty in any citizen. There were held before us the great principles which are the rock foundations of the Republic, until in every American breast the consciousness flowered that it was a great privilege just to be at home in a land so nobly reared.

It is worth remarking here that it was during that period that the best of our immigration came—people from all parts of the world who came to the shrine of Liberty, for the sake of Liberty, and not merely to an "easy" country where material concerns comprised the total benefit. What we were then, or what we dreamed then, attracted the like-minded of all lands.

But of those old ideals we hear very little now. Not many weeks ago a young Southerner arose in Congress and made a speech in which he exulted in all that America was meant to be and was destined to be, materially and spiritually. Down South they still know what America means. But the paragraphers poked fun at the speech. Now it would be just as foolish to denounce the paragraphers as it was for them to ridicule the speech. Both these things are signs. The speech is something like the first robin in spring, or the first song of the meadowlark—it is a sign that things are on the turn, that somewhere the spirit of America is reviving, that the principles of the fathers are still vital, that the dream of America is coming true. We have been so closely caught in the excitement and strain attending the rise of our new industrial era, and the downfall of the old European era, that we forgot the dream for a little.

Our forgetfulness allowed many un-American ideas to take root among us. Never were so many people so busy in trying to introduce among us the very ideas which brought old Europe to her knees in disaster. But are these people doing so for the deliberate hurt of America? Oh, no. Their intentions are of the best. Their own Americanization is so incomplete (notwithstanding they trace their citizenship back for generations) that they have sought to fill up the empty spaces with ideas imported from the failure-sown fields abroad. If these very active American minds had only been Americanized, they would have seen that in our own American foundation are as yet unrealized principles which would do infinitely better all that they are trying to achieve through alien principles.

It is a fine thing to understand and appreciate the spirit of other peoples and races, but the result is always certain to be a lopsided attitude, a deficient comparison and an incomplete action unless first we understand and appreciate the vital essence and quality of Americanism.

It is all very well to talk about internationalism, and about the damage which insistence of a narrow nationalism has done to the world. That kind of talk was rather fashionable a little time back. It would have been useful talk if it had been mixed with brains and knowledge, but it never went so far as that. It is folly, utter folly, for people of the same race, organized under separate governments, to imagine themselves as possible enemies. In that sense, nationality has been something of a hoax. It may be defended on the ground of efficiency in administration, as are the various state governments within our own nation, but certainly what every nation should know is that one great racial bloc is living under separate governments, and that a consciousness of their racial unity ought forever to prevent international trouble.

But to insist on Americanism is not to insist on a narrow nationalism. The essential principles of Americanism are the goal toward which all civilization is striving. Nor is this said in the bombastic national sense, for these principles were born before the United States came into existence; the United States was created as a nursery in which these principles could be brought to full growth, that all the nations of the earth might see, and seeing know, the practical nature of Liberty in all things. The historic mission of the United States is to give a demonstration to the world of the reality and endurance of certain principles toward which the heart of all humanity reaches in hope and longing. Americanism is not American in the sense of being our special nationalistic creation and possession, but as being our demonstration of that which the whole world can have.

Those, then, who have been caught with the half-baked idea of a false internationalism, should study Americanism once more, as the vehicle of the deeper values which they have dimly seen through their imperfect liberalism.

The assumption of the recent Americanization movement that only the alien-born needed it, is partly the cause of its failure. Americanism cannot successfully be taught as part of a textbook system. Like religion, it can be taught only out of the burning convictions of the heart. And this heart-Americanism could be profitably striven for among millions of Americans today. They need instruction. Merely being born here does not make one an instructed American, any more than merely passing through Ellis Island and the citizenship process does.

In future pages this matter will be taken up again, for its importance touches the very root of our life. When Americans become American in the true sense, aliens will breathe Americanism as a new and yet a native air.

A volume of 452 pages, durably bound, containing 98 of these articles, under the title of "Ford Ideals," will be sent postpaid for $1.00.

Sad for France

THE defeat of Poincare, while a triumph of right in one direction, is a triumph of error in another. It is no longer possible to gauge occurrences on the Continent in any other than this double light. The whole psychology of the French Government was bad in the Ruhr matter; but the whole psychology of the communism which has dealt a deep blow to the author of that policy is thoroughly bad also. Financiers may patch up affairs a little while, swift changes of government may give temporary stimulus to hope and action; but something deep and dangerous is working in the whole situation; and the defeat of Poincare is only one sign of it. With the world definitely resigned to expect no statesmanship from France, no recovery from the war psychology, no belief in the "hypocritical" ideals of western civilization, anything may happen, though probably not with suddenness. The revelation of France as a fertile soil for the Communist poison is bad news for the world at large, and particularly for Europe. For any soil that naturally takes that seed and nourishes it, rears destruction for all that exists upon it. France never needed friends more than she does today, but France was perhaps never more disdainful of friendship's reciprocity.

The Leaven Is Working

SPOKANE, WASHINGTON, has defeated a proposed issue of bonds amounting to four hundred and twenty-seven thousand dollars. It requires a sixty per cent vote to authorize in that state, and the "Yes" vote, although a majority, fell short of the required percentage.

That the idea of the waste in borrowing, the loss to the people through the delegated scheme for money issue, had a part in the result, can hardly be doubted. The people are coming to see that whatever the amount they borrow, the amount they repay is just double.

In spite of urgent need for new public buildings, Cleveland has recently defeated a proposition to issue bonds for a new jail and municipal courts. One big objection to the issue was the increase in taxes which would be caused by an increased interest account.

Were the government able to issue money on the people's bonds, much waste might be eliminated.

One of the Spokane, Washington, newspapers maintains a service department, which offers to answer questions and give information. Such a department may be and often is a power for good, but it is also in frequent use for the dissemination of propaganda and misinformation, usually with entire innocence on the part of its conductor.

As an example of such misuse the following questions and answers are worth attention:

Question—"Spokane. Is it true the government receives no interest on the notes issued to the Federal Reserve System?

"If it is true, why should not our school bonds be deposited with Federal Reserve System banks and currency issued, with no interest charge?—H. H."

Answer—"(1) It is not true. Federal Reserve banks pay a franchise tax to the Treasury Department after paying operating expenses, six per cent interest on stock and a 10 per cent distribution to a surplus fund. The Federal Reserve notes must be secured by forty per cent gold and the rest in rediscountable paper. (2) There is no provision in the law for any such transaction which is purely a theoretical proposition as applied to school bonds or any other securities. The Federal Reserve System has no machinery to handle such an arrangement."

Now, compare this "information" with the facts:

Federal Reserve notes are issued by the United States Treasury *at cost of printing,* upon deposit of certain securities, *without charge for interest, and without participation in the interest the deposited securities carry.* No man can answer the question categorically other than affirmatively.

The franchise tax alluded to has no connection with the issue of currency. After the multiplied expenses of the Federal Reserve System, its high salaries and costly buildings (to which government contributes but in which it has no ownership) have been figured up, the government is entitled to ninety per cent of the profit that remains *whether any money has been issued or not.* The System has had its full return, and additional allowances for depreciation and even banking losses, and may add the remaining ten per cent to its surplus.

However, before the government could claim a dollar as franchise tax the Federal Reserve banks were permitted under the law to *add all profit to surplus until surplus should equal subscribed capital,* and it was *five years before any franchise tax was paid.* The original investment was fifty per cent of subscribed capital. When the surplus and subscribed capital became equal and the franchise tax thus became available, *the System was receiving twenty-four per cent on its investment. Every year subsequent to the original five-year period an addition to surplus of ten per cent of net profits has added to that profit.* Now, the total amount which the government has received to date as franchise tax, *has been less than the government's cost for additional bureaus to keep accounts with the System.*

When the franchise tax became effective, under conditions given in the above paragraph, every regional bank must have its own building, the maintenance expenses of which more than offset rentals previously paid. This lowered the net profit, and millions have been expended on these buildings, the contribution of the public being ninety cents on every dollar.

Just one point aside: During the depression of 1920-22 the government received about $60,000,000 a year as a franchise tax, while since the resumption of industrial activity the amount has been less than two millions.

This indication that the prosperity of the System depends on the presence of depression in business in itself justifies every criticism.

The Spokane newspaper entirely missed the purport of the non-interest-bearing public bond. Let us take the case of Spokane. There is little question that if the recently defeated $427,000 bond issue for schools could have been secured without exorbitant total interest, the proposal would have carried. If Spokane's bonding limit would carry that amount in bankable bonds, it could carry the same in bonds without interest if she could find a market. Public bonds are the best investment to be had, and would form a good security for the issue of money. At present we have an equation something like this:

Let B represent the loan; M the lender; F the Federal Bank rediscounting M's paper to supply the funds; T the Treasury which prints and delivers to F the notes on deposit of the security required.

By the simple rule of elimination, M and F can be dropped from the equation and it would stand: B=T.

The issue of the currency by the Treasury on delivery of Spokane bonds, which are as good or better than those on which the money is printed for the Federal Reserve System, involves no cost, no change in principle; but it would save Spokane an annual interest charge of approximately $20,000, or an aggregate of about one and a half times the principal of the loan. With the principal paid back in installments of four per cent of the principal, and the notes retired in equal amount as fast as the bonds are paid, there would be neither undue expansion nor undue contraction of currency volume. Work would be expedited. Progress everywhere assured. Waste eliminated. The increasing load of interest efficiently checked.

Mr. Lodge Proposes

MR. LODGE cannot be unaware that his proposal of a World Court is tantamount to active competition with the League of Nations, if not direct antagonism to it. Such a court, with the United States and the British Empire as members, would by that fact become greater and more powerful than the League ever promised to be.

The proposal sets up in advance that certain American doctrines are to be accepted at the outset as not subject to the court's jurisdiction, which in itself is more the attitude of power than of counsel—an attitude that is doubly essential at this troubled period of the world's experience.

The document in its terms is more declarative than invitational and if it becomes acceptable to the other nations, which is not unlikely, the moving motive no doubt will be the prudential reflection that there is everything to gain and nothing to lose by walking into the same room with the United States. However, most distinct declarations are made that when the United States walks into that room, it is as the United States of America and not as a postulant participant in European affairs.

The Lodge proposal seems to have no other merit than to arrange for the United States to do formally what it has since the war been doing informally—and doing very well, too, if we may say so. Why it is introduced now, no one seems to know. It has been met with the same casual indifference with which all other international proposals have been received by our people.

Burns Out

WILLIAM J. BURNS has quit his position as chief of the Detective Bureau of the Department of Justice, a position to which he should never have been appointed, and against which appointment THE DEARBORN INDEPENDENT was probably the only big paper to register a protest. The fact that he is now out gives no ground for congratulations; there has been time enough to do all the doubtful things that could have been done. No man in private detective business ought to be placed in contact with the great mass of government information, under any circumstances whatever. It is extremely doubtful if a man with a detective type of mind ought ever to be placed in control of the Bureau of Investigation. This remark does not apply to the true investigatorial or research type of mind, but to the type which Mr. Burns' career has very amply illustrated.

It has been noted at large through the country with what apparent ease and smoothness Mr. Burns has been able to glide through the recent storms which raged in his general vicinity. The reasons for this apparent immunity have been the basis of much *sub rosa* discussion in Washington.

However, Mr. Burns' departure, from whatever cause, is another good sign that President Coolidge and his new men are working to give the country a new deal.

And there are others, within as well as outside the Cabinet, whose severance from office would be greeted, if not with a cheer (the country is hardly in a cheering mood) then with a deep sigh of satisfaction.

Oil vs. Dollars

CLARITY appears in the oil situation. The President's Commission calls halt to all deals that put dollars above naval oil supplies. Even the system of paying for the erection of storage tanks with oil taken from the reserves, is condemned and stopped. The Commission acts on the principle of "saving publicly owned oil for future needs rather than of saving public funds from present expenditures." In the day of emergency, the Navy can't burn dollars nor Congressional appropriations however large. The present *market value of* oil, high or low, should not govern our policy with regard to the oil reserves, says the Commission, but its possible *emergency value* at a future date. The most emphasized argument of Secretary Fall and Secretary Denby was that their policy saved dollars. This was fitting enough argument for one side of the question. But the President's Commission has reached a more solid basis by keeping its eye jealously on the Navy's oil.

Way to Save Two Millions a Day

By CARL HERING

PROBABLY never before have the people of this country so unanimously favored a bill before Congress as they favored the bill to reduce Federal taxes by the huge amount of about one million dollars a day.

Reduction of a million dollars a day was made possible largely by the reduction of waste in the expenses of the government. But there is still another source of waste which the government could greatly decrease, thereby reducing our Federal taxes still more, were it not for the opposition of those few who then would profit less, and for the opposition of some theorists.

For the sake of simplicity in figures, and assuming our government will not make the citizens of this country pay the debts which foreign countries owe us for money which our taxpayers loaned them when they were in distress, let us suppose that the amount that our government borrowed from us for war purposes was approximately fifteen billion dollars, in the form of Liberty and Victory bonds, at about five per cent, redeemable in about twenty years. This interest, therefore, will, in twenty years, amount to another fifteen billion dollars, which, of course, the government must first collect from the people in taxes before it can pay it to the holders of the bonds. Hence every dollar thus borrowed for the war costs the taxpayer about two dollars, by the present system—one dollar principal to be repaid, and one dollar interest.

That this interest goes back to the people is no proper argument to justify this system, as it does not go back to all of those who pay it in taxes to the government. This interest, which the taxpayer has to pay as taxes, amounts to about two million dollars a day for about twenty years, and the sinking fund necessary to redeem these bonds in twenty years amounts to the rate of another two million dollars a day, making four millions a day in taxes, and considerably more if we have also to pay the foreigner's debts to us, by "cancelling" these debts, as it is deceivingly called.

Saving Two Millions a Day

A LARGE part of this four millions a day might be saved to the taxpayer, because it also can be classed as an avoidable economic waste. To take the extreme case, suppose the government were to buy back now these fifteen billion dollars of bonds at par, and pay for them in currency, issued for this purpose, bearing the inscription that it is a legal tender for payment of all debts including those to the government; and suppose that every year the government would buy back and then destroy five per cent of this issue, hence all of it in twenty years. The cost of these purchases would be just the same as it now costs to pay the interest on the bonds. But at the end of the twenty years this whole bonded debt would thereby have been automatically discharged without the further payment of a single dollar of the principal as there would then be no principal to pay. In other words the taxpayers would be saved about two million dollars a day in taxes for twenty years, which is about *twice as much* as the tax reduction promised by the Mellon plan. In the twenty years this amounts to a saving of approximately fifteen billion dollars in our taxes, over and above the Mellon reduction.

In principle, this simply amounts to the government borrowing money without interest. European countries could not do this because their credit is impaired, but our country could do it.

There would also accrue great benefit to industries, railroads, public utilities and private enterprises, as the money now tied up in these government bonds would be released to be invested elsewhere. Money would then be "easy," which encourages enterprise, investment and borrowing. Many of the objectionable "tax-exempt" securities would thereby be withdrawn.

A Workable Plan

STRENUOUS objections have been made to this plan, chiefly by bankers and some economists and theorists. The most important and most rational of these objections is that to flood this country suddenly with fifteen billion dollars of additional currency might have a serious effect; it might give rise to inflation, cheaper money and higher prices. This, however, is avoidable by not going to the extreme at once. Let the government buy back small lots of the bonds at a time, to permit the country to digest the extra currency. Until the Federal Reserve currency has all been replaced there would be no increase anyway. If this released money turns out to benefit the industries, as it surely would, the government could buy another lot of the bonds. The plan is a very flexible one and could be introduced gradually. No possible danger can be apprehended from the fact that for once the country would have sufficient money for its business needs.

Another objection, which is mere "bluffing," is that such currency would be so-called "fiat money" or "printing-press money," the present German mark being cited as an alarming example. It is evident that such currency is no more "fiat" or "printing-press money" than are the Liberty bonds themselves! As a matter of fact, the security of our Liberty bonds would be twice as great with the cost of the redemption plus interest cut in half, as it certainly would be by this plan. Even today these bonds are often used and accepted as currency in paying large bills, so that merely to replace these pieces of printed paper by a larger number of smaller pieces of green paper, more convenient to handle, and releasing them from the troublesome "accrued interest" calculations, would not impair their value in the least, nor lower them to the class of the debased German printing-press money.

Another objection made by some is that such an issue of new currency would reduce the prevailing rate of interest. This, of course, the bankers seriously object to, their profits increase as rates of interest rise, and unfortunately it is the bankers' point of view which largely controls our government financiering. But the people and the industries gain greatly by lower rates of interest; why should the many creative institutions be made to suffer for the benefit of the relatively few financial institutions?

The Taxpayer Asks, "Why?"

ANOTHER objection is that the Federal Reserve would lose its most profitable function of *printing currency which is theoretically sixty per cent "fiat," in that each dollar note may be backed by only forty cents' worth of gold, the rest being backed only by "somebody's" credit, not even the credit of the government!* A large part, if not most, of the paper currency now in the hands of the people is this sixty per cent fiat currency.

When the Federal Reserve gets six dollars a hundred interest, two dollars and forty cents of this is six per cent legitimate interest on the gold involved and three dollars and sixty cents of it is interest on mere numbers printed on a small piece of paper. During one year it is reported to have in this way made more than one hundred per cent interest on its invested capital.

Why should the people be made to pay such enormous profits to a few bankers, when the richest government in the world could replace this paper currency, with another having the government's credit behind it, and charge the people no 3.6 per cent on mere values printed on pieces of paper.

Those who now borrow from the Federal Reserve could then borrow from the banks as they did in former days. Naturally the Federal Reserve will object strenuously to the above plan, but why should not the people and the taxpayers be considered also?

The above plan has been much discussed with bankers, economists and theorists, and the objections given above are believed to include all that seem important. It is believed, however, that the public and the taxpayers are not yet familiar with it. The time has come when the people and especially the taxpayers are beginning to think about such things themselves and "want to know why" it will not benefit them; they will not much longer be silenced by the usual reply of bankers and economists, "Shoemaker, stick to your last."

More Crutches or Lighter Burdens

By WHIDDEN GRAHAM

IN HIS message, accompanying his veto of the Texas Seed Bill, February 16, 1887, President Grover Cleveland embodied the principles of Jeffersonian democracy in these few words:

"Though the people support the Government, the Government should not support the people."

The American people have traveled far, since this simple declaration of the relation of government and citizen, in the direction of having the national government wholly or partly support the people, either through finding them jobs in some new bureau, commission or other regulatory activity, or by giving aid and financial assistance to productive enterprises. The powers of Congress have been widened and extended beyond anything that the President in 1887 could have dreamed. Despite his warning against the communism of taxing the people for the benefit of special interests, the system of "encouraging home industry" that he denounced is still in full swing, and the feeble protest of the unorganized consumers is unheeded. On every hand there are "blocs," groups, societies, associations, movements; all aiming to secure larger appropriations for some pet project.

Is anything awry? Congress must make a law to fix it. Create a new bureau to investigate and regulate, and if that doesn't help, appoint another commission, to find out why the first law was a failure. More parasites, officeholders, and tax eaters, burdening production and trade. Ever higher and higher go the taxes, taking toll of industry and limiting the general purchasing power. If the states refuse to protect their citizens, shift the job to Uncle Sam. He has all the money there is, and his borrowing powers are unlimited.

No longer is it fashionable to talk of economy and retrenchment; of self-reliance and sturdy individualism. Every theorist and faddist who has even the smallest following can get the ear of Congress. Do something for the manufacturers. And there is the highest tariff law in history. Something for the farmers. Straightway there are Land Banks and Farm Loan systems, inspired by the brilliant idea of getting the farmer out of debt by lending him more money. Then comes the business "bloc," the "bankers' bloc," and all other "blocs" to tell Congress what they want done. More than one hundred and fifty national organizations, all working for some special legislative scheme, have propaganda offices in Washington. The newspapers are flooded with reams of publicity stuff, showing that the downfall of the republic can be averted only by the enactment of House Bill 0778, to provide suitable props for leaners.

Government is being urged to a greater extent than ever before to support the people. Rising taxes are reflected in higher prices, higher rents, higher freight rates; from which relief is sought through government action that means still more taxes. Welfare legislation; uplift laws, degrees of paternalism ranging from strict regulation of private industry to government ownership and operation.

The manufacturers who are now denouncing the folly of proposed special legislation for the farmers are the same men whose agents a year ago filled Washington hotel lobbies, while working for favors to their industry. They got theirs, so it's time to let up on this special legislation business. The more government tries to do for the people, the more dependent they become. Keep the baby in the cradle and it will have weak legs. Chuck off some of the useless burdens that the people have to carry, and they won't need so many crutches.

Militarism Dead for Anglo-Saxons

WHEN the nations gathered at Paris after the war, there were three types of civilization represented: the Continental type, the Republican type and the reawakened Asiatic type. In my judgment the destiny of the world depended on which camp Great Britain should march into. For the moment, at least, she marched into the Continental camp and became bound up with a peace which forbade the resuscitation of Europe, which kept alive hates and fears that were the source of armies and navies, which looked back rather than forward.

But it was one thing to march into the camp; it is quite another thing to stay there. That, in my belief, the British character and genius will not allow. It would be impossible at the present time for any statesman in the world to create a war fever in the British Isles. We are not a timid people; we are a martial people. Lord Birkenhead has said so! And we still love glittering prizes; but we know that glittering prizes do not come that way. We are persuaded now that war is not only radically inhuman, but that it is unjust and it is futile.

Whether we like it or not, we now happen to have a Prime Minister who, during the war, was ready to go to jail for his conviction that all war is wrong. I mention the fact simply as a phenomenon of striking significance. I am not saying what I think of Mr. Ramsay Macdonald's politics, but that is certainly a very curious thing. I do not think it is the sort of thing likely to happen anywhere else in the world. It is one of those quaint things that Britishers do. We can seldom explain why we do such things, but we have a very sure instinct for common sense, and a very deep love for what is just and right.

Thanks to our island security, we have developed this kind of temper; and we are at this moment presenting to the world this phenomenon: within five years of the close of the bitterest and most deadly war in history, we put, I believe, into Parliament some twenty-odd members who only five years ago were put in jail. What it all means is a radical change of mind. The cause of peace is growing in power. Militarism is dead in the soul and conscience of humanity, and particularly of the Anglo-Saxon section of humanity. We are seeing that the thing is manifestly absurd and ought to be outlawed. It is going to take a while. We must have an organization and the method is the League of Nations. It is a question of time, but victory will be on the side of international understanding.

Excerpt from a recent address in Edinburgh, Scotland, under the auspices of the League of Nations Union, presided over by Lord Sands and attended by more than 1,000 enthusiastic people.

When Congress Chose John Adams President

Just a Century Ago the People Failed to Elect; Jackson's Fight

By J. V. NASH

COMPARATIVELY FEW, perhaps, among the general public realize that under certain conditions the House of Representatives is empowered by the Constitution to elect the President of the United States, much in the same manner that the national executive is elected in France. True, the circumstances which would take the election out of the electoral college and throw it into the House are unusual, but at least once in our history such circumstances have actually come to pass.

That was in the election of 1824, which, curiously enough, happens to be just one hundred years ago. John Quincy Adams, the last citizen of Massachusetts to occupy the White House until the inauguration of President Coolidge, was proclaimed President of the United States, although in the abortive regular election Andrew Jackson had received the highest number of votes, both popular and electoral.

John Quincy Adams, the only President who ever held office by the grace of the House of Representatives, is a unique figure in American history, not only because of his election by the House, but by reason of the fact that he is the only son of a President who has ever succeeded to that high office. Again, he is the only President who, after his retirement from the White House, was elected to Congress and represented his state as a legislator in the national Capitol.

Although he became United States Minister to Holland, by appointment of President George Washington, there are men and women still living today who remember John Quincy Adams in the flesh. Chauncey Depew and Dr. C. W. Eliot, of Harvard, were boys of fourteen, and John D. Rockefeller was nine, when the earthly life of John Quincy Adams drew to its close.

"The Era of Good Feeling"

IN 1816 James Monroe became President and served two terms. John Quincy Adams, who was at the time Minister to England, was called home to assume the position of Secretary of State, the duties of which office he discharged with signal success during the eight years of President Monroe's administration.

It was while Secretary of State, in the last year of President Monroe's administration, that John Quincy Adams promulgated the Monroe Doctrine. The purpose of the Monroe Doctrine, briefly stated, was to protect the Spanish-American republics, which had but recently gained their freedom from Spain, against any attempt on the part of Spain or other European kingdoms to deprive them of their independence. In a broader sense, the nations of the Old World were given to understand that the United States would not tolerate any future aggression by European monarchism upon any part of the western hemisphere—that the American continent would henceforth manage its own affairs.

The closing years of Monroe's administration had been marked by a very extraordinary "era of good feeling," in which, as never before or since, factional politics were forgotten and a spirit of peace and brotherhood was abroad in the land. The fiftieth anniversary of independence was just coming into view, and the farewell visit of Lafayette to America had rekindled the memories of the Revolution.

All the Presidents, up to and including Monroe, had taken an active part, as grown men, in the winning of independence. With the retirement of Monroe, a younger generation was to take control of the nation's destinies.

In 1824 there were no great political issues, and interest in the Presidential election centered chiefly in the personalities of the candidates.

Five candidates definitely entered in the race for the Presidency, three prominent Cabinet members, an able Congressman, and a popular military man. They were:

John Quincy Adams, Secretary of State.
John C. Calhoun, Secretary of War.
William Henry Crawford, Secretary of the Treasury.
Henry Clay, Speaker of the House.
General Andrew Jackson.

A Campaign Without Parties

A STRANGE feature of this campaign was that for the only time in our history, if we except the first Presidential election when Washington was a candidate, there were no rival parties in the field. All of these candidates were of one party, or rather, of none. It was a purely personal contest among a number of men, all of whom stood on practically the same platform.

Before the election, however, Calhoun, finding that the states which were his strongholds were going "Jackson mad," threw his support to Jackson for the Presidency, in return for Jackson's endorsement of his (Calhoun's) candidacy for the Vice-Presidency.

Jackson, the hero of the Battle of New Orleans in 1815, had started his campaign for the Presidency shortly after his return from the governorship of Florida in 1821, by an attack on the old Congressional caucus method of nominating Presidential candidates. Tennessee, which was Jackson's home state, had in 1822 defied this time-honored system by formally placing Jackson in nomination for the Presidency.

It was at this time a tradition that the Secretary of State in the outgoing administration should be a candidate for the Presidency. John Quincy Adams naturally, therefore, had the support of many friends of the administration. Although he was not originally opposed to the Congressional caucus, he now issued a statement that he would not accept a nomination from that source. However, on February 14, 1824, a caucus was held, which nominated W. H. Crawford, of Georgia, for the Presidency. This was the last Congressional caucus ever held, and the abolition of the caucus led to the adoption of the system of national party nominating conventions, which has existed ever since.

Shortly before the election, Crawford suffered a stroke of paralysis which left him so helpless that he could no longer even sign his name. Extraordinary as it may seem, his political friends endeavored to conceal his condition and insisted upon keeping him in the race.

At last the day of the election arrived. When the electoral votes were counted, the result was as follows:

Jackson	99
Adams	84
Crawford	41
Clay	37

Calhoun was elected Vice-President by a comfortable vote of 182.

It is, of course, evident that Jackson had by far the largest number of electoral votes. Adams, however, had no reason to complain of his showing. As one historian says, it was "a remarkable vote, considering his ungracious manner, his gift for making enemies, and refusal to do anything to promote his election." *But no one of the four had a majority of the votes cast,* as required by the Constitution, so the election was thrown into the House of Representatives.

Now another interesting situation developed. The House was restricted in its choice to the three candidates having the largest number of votes. Henry Clay, standing fourth in the list, was thus automatically eliminated by only four votes.

It was now a three-cornered contest, and the key to the situation rested with Clay. As Speaker of the House of Representatives, his influence would decide the election. Himself debarred from a candidacy to the high post which he eagerly coveted, he had the bitter pleasure of making a selection among his rivals.

Crawford's candidacy, of course, Clay could not take seriously, the election of a paralytic as President being unthinkable. He must choose between Jackson and Adams. If Adams had a gift for making enemies, Jackson, with his violent temper, had a similar unfortunate gift, although his popularity with the masses was immense. He had already antagonized Clay, and although the latter was not particularly friendly to Adams, he believed that he could get along better with him than with Jackson.

The Beginning of Factional Politics

SO CLAY threw his strength to Adams, and Adams was elected, with the states voting as follows:

For Adams	13
For Jackson	7
For Crawford	4

The cleavage of the states was extremely irregular. In the Adams territory we find New England, New York, the Ohio Valley except Indiana, also Maryland, Missouri, and Louisiana. The Jackson territory included Pennsylvania, New Jersey, South Carolina, Tennessee, and the cotton states of the Southwest. Georgia, North Carolina, Virginia and Delaware went with poor Crawford to the last ditch.

We have said that for some time before the election of 1824 there were no political parties and that an era of good feeling prevailed. The election of Adams, however, was the signal for the beginning of a period of the most violent factional politics and an era of very ill-tempered feeling.

Jackson, as we have already noticed, had received the largest number of electoral votes and also a plurality of the popular vote in the regular election. He and his followers did not acquiesce with good grace in the election of Adams. Although the House was free under the Constitution to elect any one of the three leading candidates, it was insisted by the Jackson followers that the general was "morally entitled" to the election, and that the choice of Adams had been brought about by a corrupt bargain between the latter and Henry Clay.

Their fury was fanned into white heat when, shortly after the election, President Adams appointed Henry Clay Secretary of State. The Jackson partisans accepted this as conclusive proof of the corruption at which they had already hinted. It was charged that Adams had sold the post of Secretary of State to Clay in return for his support.

A Glimpse of Growing America

IT IS impossible to say just how far Jackson really believed in Adams' corruption. At any rate, the charge against Adams has never been taken seriously by the historians, for whatever else Adams may have been, he was a man of singularly scrupulous personal honor, and his appointment of Clay is quite justified by precedents before and examples since.

John Quincy Adams was 58 years of age when he entered the White House. A paragraph from his inaugural address gives us an interesting glimpse of conditions in the nation as they appeared to the President-Elect just one hundred years ago:

"In the compass of thirty-six years since this great national covenant was instituted . . . . a population of four millions has multiplied to twelve. A territory bounded by the Mississippi has been extended from sea to sea. New states have been admitted to the Union in numbers nearly equal to those of the first confederation. Treaties of peace, amity, and commerce have been concluded with the principal dominions of the earth. The people of other nations, inhabitants of regions acquired not by conquest but by compact, have been united with us in the participation of our rights and duties, of our burdens and blessings. Forests have fallen by the axe of our woodsmen; the soil has been made to teem by the tillage of our farmers; our commerce has whitened every ocean. The dominion of man over physical nature has been extended by the invention of our artists. Liberty and law have marched hand-in-hand. All the purposes of human association have been accomplished as effectively as under any other government on the globe, and at a cost little exceeding in a whole generation the expenditures of other nations in a single year."

Adams made no greater effort to retain the Presidency than he did to get it. The modern Democratic party was now forming around Jackson as its leader, and in the election of 1828 the old soldier and frontiersman was swept into office, and Adams stepped out, a one-term President, seemingly without regret.

Old Beecher Church—Brooklyn's Landmark

Concluded from page 6

for many years. The installation of the pastor-elect was notable because of the catholic composition of the council, which contained distinguished representatives of six denominations—Congregational, Episcopal, Methodist, Baptist, Presbyterian and Reformed. When Dr. Lyman Abbott entered the pulpit of Plymouth Church, new interest in its doctrines was aroused. Dr. Abbott taught the new theology in language beautiful and persuasive. His sermons, filled with strange and startling thoughts, were earnest, soul-to-soul talks with his congregation. He was broader in his theology than Beecher ever was, while still preserving Beecher's general attitude toward divergent beliefs. He continued as pastor of Plymouth Church until 1899, when he resigned to take up his work as editor of *The Outlook,* the successor to the *Christian Union* that had been founded by Mr. Beecher. He died in 1922, in his eighty-seventh year.

With the retirement of Dr. Abbott, it seemed again a serious problem to find a successor worthy to occupy the pulpit of Plymouth Church. The selection of the Rev. Dr. Newell Dwight Hillis, however, has shown that the life of the great old meeting house does not depend upon any one man, no matter what his merits may be. It has often been said that it would be difficult to find three men more different from one another than the three who have successively occupied Plymouth's pulpit, and still the general tenor of the life of the church has not altered.

When Dr. Hillis assumed the pastorate, his voice rang strong and clear with the new revelations which seemed to be ushered in with the dawn of the twentieth century. He was found to be an orator whose arguments were so original, whose ideas were so clearly defined and so well set forth, and with a delivery so masterly, that it was a pleasure to listen to him.

Under Dr. Hillis, theological matters have been more or less subordinated to general aggressive church work. The effect upon the church itself and its membership has been to make it exceedingly liberal.

Plymouth Church has been greatly beautified under the pastorate of Dr. Hillis. Three series of windows were installed, depicting the history of Puritanism and its influence upon the institutions and people of the United States. The upper windows portray, among others, the following scenes:

Political liberty. John Hampden and John Pym, appealing for the Bill of Rights before Charles I.

The signing of the Compact of the *Mayflower.*

The landing of the Pilgrims.

The lower windows:

Roger Williams and personal liberty. Rhode Island.

The Quakers' gospel of the inner light, and the peace movement in Pennsylvania.

The overflow of Puritanism upon the great West.

Opposite the pulpit:

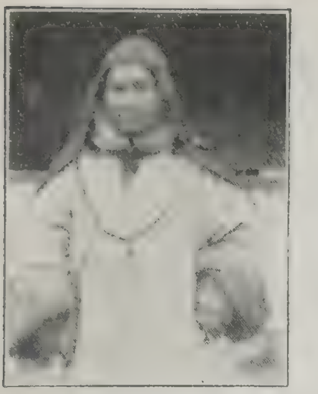
Abraham Lincoln writing the Emancipation Proclamation.

Henry Ward Beecher raising the flag at Fort Sumter.

Harriet Beecher Stowe writing "Uncle Tom's Cabin."

At the unveiling of the windows, Dr. Hillis, in his sermon on "The Influence of Puritanism upon the People and Institutions of the Republic," said:

"In the faith, therefore, that the God of our Pilgrim Fathers is our God, and shall be the God of our children after us; in this old meeting house, consecrated to democracy, and standing for absolute independency of the church; where there are no orders, no classes and no ranks, where we neither look up nor down, but look out, upon all our brethren, because we are all in the image of God; here where a thousand pleas have been made for the slave, for the poor, for liberty, for loyalty, for equality, opportunity, intelligence and integrity, we are come to celebrate the guiding hand of God in our history, to swear fidelity to the great convictions of our fathers, and to commemorate the history and influence of Puritanism upon the people and institutions of the Republic."



Buddhist priest.

When a Man Dies in China

They Dress in White, Get Out Their Etiquette and Make Quite a Social Event of It

By MRS. L. M. CRAMER

Taoist priest.

LIEU TSOONG-TUH lay dying. Several times they had thought him dead, but pins plunged into the soles of his feet had brought a wince and a slight jerking of the otherwise quiet flesh. Thus they knew that the old man still clung to life; knew that the vital spark had not yet flown—though they did not call it that, for "vital spark" is not a familiar word to the Chinese.

Near the deathbed stood the ten sons of the dying man, stalwart, manly fellows. The gods had been good to Lieu.

Outside the home of Lieu Tsoong-tuh weird sounds were to be heard and weirder sights to be seen. Prolonged wails recalled to the foreigner the cry of the timber wolf in the dead of the night on the western plains. Fantastic shapes flitted about, fearsome to behold. Drums and Chinese gongs were beaten, great bunches of red firecrackers were being exploded, and everywhere the noise increased in volume as night approached. Within the house, beside the k'ang on which the old man lay, the watchers heard and were comforted, for with all that din and noise, the flitting soul of Lieu would find protection from the evil spirits who lay in wait for its passing, to pounce upon it and torture it for all eternity. It would be a venturesome spirit indeed that would brave the sights and sounds that made Lieu's last hours tranquil.

Funeral procession.

Three weeks ago—or was it four?—the eldest son had brought home a wonderful coffin, long enough for the tall, gaunt form of Lieu Tsoong-tuh and wide enough to accommodate certain treasures close to his body—the bowl of white jade which the old Empress Dowager had presented him for a service done long ago. Lieu had been a man of considerable power and influence in his day. More than two hundred catties that coffin weighed. It was made of pieces of selected, very heavy hardwood, the whole covered with a beautiful lacquer. At the head was a panel, red lacquered, with the characters which meant "Long Life" inlaid in gold.

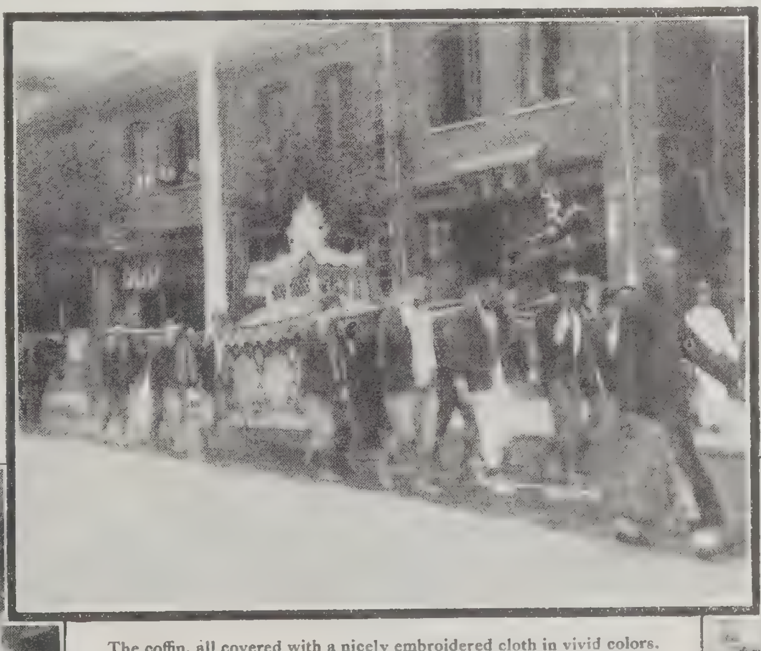
To Lieu and his family there was nothing gruesome in this bringing home a coffin in which he was to be buried when the gods willed it so. It is a mark of filial devotion to bring a coffin into the house, if a parent is ill, or very aged. What the sons of Lieu had done for their father, every Chinese son will do for his parent. The rich son will spend more money and more time in carrying out the ceremonies for the dead which are approved by centuries of usage in China, and the poor will frequently mortgage their future for years to give their parents proper burial. This is often done as much for the protection it will afford the doers, as for any love they may bear the deceased; self-protection because it is believed that the spirit of the deceased can return to harm those who neglect the proper rites. In China—as everyone knows—spirits of men who die without proper funeral care become wandering spirits, going about doing mischief.

When Lieu is dead, the diviner will be called in. With the help of his books and his abacus he will reckon out the day and the hour on which the spirit will leave old Lieu's body as a visible vapor. If he is a good diviner and knows his business properly, he will be able to tell the form and color the spirit will take on when it leaves the body, and even in which direction it will make its way to eternal rest in heaven.

Images at head of funeral procession, to scare away devils.

Not that the family of Lieu want to be on hand to witness the phenomenon occur—mercy, no; that would be very bad joss—for to catch a glimpse of a departing spirit would foreshadow the witnesses' deaths within a few moons. But if one knows when the spirit is to take its flight, one can go into another part of the house and escape baleful influences. There is no need to tempt death! The diviner will also choose a lucky day for the burial of old Lieu, and he will also attend that the burial spot chosen for Lieu shall be proper.

Before the day of the burial, which may not be for two or more months after the heart of Lieu has ceased to beat, Taoist priests will go to his house and chant prayers to open the way to heaven for the old man's spirit to pass. They will bring pictures of gods and hang them up in the room where the body lies. In the presence of these gods they will extol the dead and pray for his immediate entrance into the Western Heavens. In some other part of the house, or possibly in a temple, and at that same hour, the Buddhist priests will chant prayers for the repose of Lieu's soul. Then comes a day when the Lama priests will be called in to do their part. Thus will the soul of Lieu Tsoong-tuh be escorted across the ferry.



The coffin, all covered with a nicely embroidered cloth in vivid colors.

Some families have the Buddhist priests chant for seven days; then each recurring seventh day until seven times seven; after that again on the hundredth day and after that not until the first anniversary of his death.

Every day during the first year after Lieu's death, food will be placed before his tablet—and the tablet will stand in the middle room of the house beside the household gods. After the first anniversary of Lieu's death has passed, food will be offered only at the different feasts of the year. At the feast of Ching Ming every spring the family will not only present food before the tablet of old Lieu, but they will burn paper money there and afterward will go to his grave and burn gold, silver and white paper money. At the ceremonial of the Ghosts' Feast, which is the fifteenth day of the seventh month, food will be presented and incense and paper money will be burned and on that day also a paper boat will be burned to take the soul across the river, and each year on the first day of the tenth month, when it is thought that the dead will need his winter clothing, the family of Lieu, his widow, his two secondary widows, and his three concubines, his ten sons and all his daughters-in-law, and the grandchildren, will prepare large rolls of paper (imitation rolls of cloth)—well wrapped in paper prepared for the purpose. Inside these rolls of imitation cloth they will place a liberal amount of paper money, and money will be placed on the k'ang in the house, beside which will have already been placed a small table on which is food and wine. Very solemnly will old Lieu, beloved of his family, be invited to come across the river dividing life from death, and partake of this food and drink. At sundown the rolls of paper cloth and the money wrapped therein will be taken out into the courtyard and burned before the door of the house.

However, proper precautions will be taken to guard this wealth from getting into the hands of the wandering spirits, for, before the match is applied, three sheets of paper money will be placed at the side of the package intended for Lieu to attract the attention of the wandering spirits, who will steal it and go away, leaving Lieu's money to be delivered to him as it is burning.

In what we are pleased to call the civilized countries, which means "homeside" wherever that may be, the widow will wear mourning of the deepest black. In China the widows wear a sort of coarse white calico, and a wide band of the same material will be wound about their heads.

According to Mrs. Annie Cormack, an authority on things Chinese, the burning of paper articles for the use of the dead began in the T'ang dynasty, about 739 A. D. It was at that time also, that mock money was first burned at the imperial sacrifices. In more ancient times real money was placed in the coffins of the dead, but as graves were too frequently rifled by bad characters, that practice gradually died out.

Because of his wealth, and the position he has held all his life in both the financial and social world, and because of the friendship of the old Empress Dowager which was his in less troubled days, Lieu's funeral procession will be a gorgeous display of things garish and weird to Western eyes. His sedan chair, borne on a special carrier, will be carried in front of the catafalque. His carriage and motor car will also be in front, and in one of these old Lieu's soul will be secreted. The catafalque in which the dead man will ride will have forty-eight bearers to carry it. His sons will march barefooted, just preceding him in the long line. Little coolies will carry a screen about them that the gaping public may not witness their sorrow. The eldest son will carry in his hand a three-tailed banner on which will be embroidered the name of his father. There will be many banners in that procession, provided by friends, and some of these banners, gorgeous of color and embroidered in gold, will bear this inscription, "LingKwei Hsi T'ien," meaning "The Soul Returns to the Western Heaven." Small paper shrines and small paper tablets, all bearing the name of the dead man, will follow, all to be burned at the grave, along with other paper articles, including wreaths of paper flowers. In old Lieu's favorite sedan chair will be placed a large picture of the deceased, and in front of that picture and facing it will be a small mirror, the same that Lieu used to look into as he rode or was carried along the streets. This is a favorite pastime with Chinese of high estate, and strikes the "foreign devil" most pleasantly, to see pompous, silk-gowned Chinese of high rank being carried along the main thoroughfare, the while they are peering at their reflection in a small mirror which is as much a part of the sedan chairs as are the coolies who carry them.

Funeral decorations at the door of a dead man's home.

There will be a band, maybe two of them, and the chances are that before the procession has been long on the way, the old familiar tune of "There'll Be a Hot Time in the Old Town Tonight" will be heard. That tune has a swing about it that appeals to the Celestial, and beside it is American and therefore must be proper.

Death is very ceremonial in China.

Government by Espionage—How It Is Done

Senators Find Out How Secret Service Agents Do Detective Stunts

(From Senate Committee Report No. 1.)

INVESTIGATION of the Attorney-General, Friday, March 14, 1924. United States Senate, Special Committee on Investigation of the Attorney-General, Washington, D. C.

Testimony of Gaston B. Means, investigator, New York City.

The witness was duly sworn by the chairman.

The Chairman. The witness has been sworn, Senator Wheeler, and you may proceed.

Senator Wheeler. What line of business do you follow?

Mr. Means. Oh, I am an investigator.

Senator Wheeler. How long have you been engaged as an investigator?

Mr. Means. Well, I started with Mr. J. W. Cannon, virtually. He used to send me out to find out what his competitors were doing.

Senator Wheeler. Mr. Means, since that time what particular firms or corporations have you been investigating for?

Mr. Means. Starting with the biggest one and coming on down, do you mean?

Senator Wheeler. Yes.

Mr. Means. The biggest man I ever did any investigating work for was Frick.

Senator Wheeler. Do you mean Henry C. Frick?

Mr. Means. Yes.

Senator Wheeler. When did you do investigating work for him?

Mr. Means. Oh, in 1915 or 1916, I guess.

Senator Wheeler. What was the nature of that work; just briefly?

Mr. Means. Something about some—he wanted to get hold of some coke fields up there in Pennsylvania.

Senator Wheeler. Since that time you have been investigating for whom, what corporations and concerns?

Mr. Means. For the German Government, the Mexican Government, the English Government, the United States Government, and individuals.

Senator Wheeler. You were employed prior to the entry of the United States Government into the war by the German Government, were you not?

Mr. Means. Yes, sir. I first became employed by the German Government—well, when I went to New York City I was more or less familiar with the cotton-mill business, and when I went there I commenced writing for the *Journal of Commerce* and the *Journal and Bulletin* on textile questions. That attracted the attention of the German secret service commercial agents in this country. Along with my work for Mr. Cannon I began investigating for them and finding out the line of goods that the English merchants were shipping into the United States, to enable the Germans to duplicate that piece of goods and try to undersell the English manufacturer. I came in contact with all the buyers that went to Europe for the big wholesale jobbing houses.

Senator Wheeler. Now, Mr. Means, did you ever work for J. Pierpont Morgan—for the house of Morgan?

Mr. Means. Well, the Burns agency represents J. Pierpont Morgan & Company, and I have been investigating under Mr. Burns for them, I suppose, at different times.

Senator Wheeler. Yes; for whom were you working?

Mr. Means. Well, at the time I have reference to specifically, the President of the United States.

Senator Wheeler. And by the President of the United States you mean whom?

Mr. Means. President Harding.

Senator Wheeler. For whom?

Mr. Means. President Harding. Jess Smith wanted to catch Secretary Mellon, and we caught him.

Senator Wheeler. How is that?

Secretary Mellon Gets It

Mr. Means. They wanted us to investigate Secretary Mellon, the President wanted the information in regard to him—to catch him—and we caught him.

Senator Wheeler. Who wanted you to?

Mr. Means. The President wanted the information in regard to him, and I gave Captain Scaife thousands of dollars to help him catch him.

Senator Ashurst. Who is Captain Scaife; is he in the room?

Mr. Means. Yes, sir.

Senator Ashurst. Identify him.

Mr. Means. There he is [indicating].

Captain Scaife. Here I am, Senator.

Senator Wheeler. But, Mr. Means, by whom were you paid when you were doing the investigating for President Harding?

Mr. Means. I was paid by Jess Smith and Mr. Underwood.

Senator Wheeler. And do you know who Mr. Underwood represented?

Mr. Means. I know that he represented the President.

Senator Wheeler. You know that he represented the President?

Mr. Means. Yes, sir.

Senator Wheeler. How do you know that?

Mr. Means. Because of the letter.

Senator Wheeler. Of the letter?

Mr. Means. A letter to Mr. Jess Smith, signed by the President.

Senator Wheeler. What was that letter, and what was the date of it, if you know?

Mr. Means. That letter simply said that the President wanted to have certain confidential undercover investigations made, and that he wanted Mr. Jess Smith to handle them, and with Mr. Gaston B. Means and Mr. Underwood. When I was suspended, the way Mr. Jess Smith told me, Mr. Gutzom Borglum, the sculptor, had written a letter to the President and told him that he knew me personally, and I was a thorough investigator, and Mr. Smith always told me that it was on the strength of that recommendation that the President had selected me to conduct these undercover investigations for him.

Senator Wheeler. And what undercover investigation did you make for the President of the United States in New York? Just briefly. I will get back to it in detail after a while, but just briefly, what was it?

Mr. Means. Well, the prime investigation was leading up from the information we had in Washington concerning an arrangement that the Secretary of the Treasury Mellon had gone into to furnish certain permits for certain purposes, and we didn't catch him that time. He slipped through our fingers. And then I went to New York City to catch the La Montagnes.

Senator Wheeler. Now, Mr. Means, who paid you for those investigations that you say were made by President Harding?

Senator Caraway Gets It

Mr. Means. Well, Mr. Jess Smith, and sometimes Mr. Underwood. You see, I was paying Captain Scaife so much there, and then I had Miss Laura Jacobson, whom I assigned to investigate Senator Caraway.

Senator Wheeler. Who is that?

Mr. Means. Miss Laura Jacobson, whom I sent for from Arkansas, to investigate Senator Caraway.

Senator Wheeler. Well, let me ask you, at whose direction did you investigate Senator Caraway?

Mr. Means. I investigated him through Mr. Jess Smith's direction.

Senator Wheeler. You investigated him through Mr. Jess Smith's direction?

Mr. Means. Yes; hired Miss Laura Jacobson to do that for me. I brought her up from Arkansas.

Senator Wheeler. Was that at the time that Mr. Caraway was making some attacks in the Senate on Attorney-General Daugherty?

Mr. Means. No. He had made some attacks on President Harding, too, prior to that, and he had made attacks on the Attorney-General, too.

La Follette Next

Senator Wheeler. Now, Mr. Means, you also investigated Senator La Follette, did you not?

Mr. Means. Yes.

Senator Wheeler. And you went through his offices here, did you not, in the Capitol?

Mr. Means. No; I did not.

Senator Wheeler. You had somebody do it?

Mr. Means. I saw that it was done.

Senator Ashurst. You did what?

Mr. Means. Well, I saw that it was done.

Senator Ashurst. Well, you saw that Senator Caraway's office was gone through?

Mr. Means. No, sir; I did not.

Senator Ashurst. Who did?

Mr. Means. We didn't go through Caraway that way at all, Senator.

Senator Wheeler. You have never gone through my offices yet, have you?

Mr. Means. If somebody will assign me to it, I will do it, though.

Senator Wheeler. Senator Moses suggests to me that I can save time by asking you what Senators you have not investigated.

Mr. Means. Oh, there are lots of them I haven't. They are a pretty clean body. You don't find much on them, either. You don't find very much.

Senator Wheeler. Now, Mr. Means, coming back to Senator La Follette, you investigated him at the instance of whom?

Mr. Means. I investigated him in April, right after he introduced his resolution.

Senator Wheeler. What resolution?

Mr. Means. To investigate Teapot Dome.

Senator Wheeler. You went through his office then, as I understand it, for the purpose of ascertaining what information he had relating to the Teapot oil scandal; is that correct?

Mr. Means. Anything he had where he could be stopped in what he was doing.

Senator Ashurst. Pardon me, who gave you the orders to do that?

Mr. Means. In——

Senator Ashurst. No; who gave you the orders?

Investigate Bishops—Anybody

Mr. Means. I got those from Mr. Jess Smith and Mr. Underwood. I didn't—investigation with me is—the man is a number; I never ask who he is. It doesn't make any difference. I would just as soon investigate a tramp as anybody else. It doesn't make any difference to me. I never ask who he is or what position he occupies. I designate the number and go ahead and get the facts if I can, and I get nothing but the facts, and report what I find.

Senator Ashurst. Nobody has asserted or supposed anything to the contrary.

Mr. Means. I mean by that it doesn't mean anything about investigating a Senator. Thousands of people have been investigated. Bishops have been investigated without knowing it. And clergymen.

The Chairman. When did this terrific spy system start in the United States; by what official authority, if you know?

Mr. Means. I have been investigating since I was twenty-one. It had been going on prior to that time. I never saw a candidate that loomed up, any little candidate for town marshal, that they didn't go out and make inquiry about him. One crowd makes it confidentially, and the other crowd——

The Chairman. What kind of crowds is it that make this kind of inquiries, financial crowds, big fellows?

Mr. Means. I don't work for the church crowd because they haven't got any money. *The financial crowd only finance and get investigations.*

The Chairman. You mean the financial interests investigate every one who is a candidate for office to get something on him so they can control him, is that the idea?

Mr. Means. Well, yes; that would be my interpretation; yes, they would want to find out what he is up to.

The Chairman. And that gang then that is behind those investigations of that nature is the same gang that I have denominated at the Nonpartisan League of Wall Street, is that the crowd?

Mr. Means. I think that President Wilson gave them the best designation: "Invisible Government."

The Chairman. Well, that is the same gang.

Mr. Means. That is the best interpretation of them.

Senator Wheeler. Now, what is the last we were on?

(Thereupon the reporter read the last question asked by Senator Wheeler, and the answer, as follows):

Senator Wheeler. You went through his office then, as I understand it, for the purpose of ascertaining what information he had relating to the Teapot oil scandal; is that correct?

Mr. Means. Anything he had where he could be stopped in what he was doing.

Senator Wheeler. That is, to find out anything about him so that he could be stopped in the investigation of the Teapot oil leases? Is that correct? You can answer that yes or no, and then explain.

Mr. Means. Well, how it was going to be used I don't know, except this way, I would interpret it. If you found something damaging on a man you would quietly get word to him through some of his friends, or otherwise, that he had better put the soft pedal on the situation. That is the way the information is generally used when you find it.

Senator Wheeler. In order to deter him in going ahead with his work in the Senate, is that correct?

Mr. Means. Work in the Senate or anywhere else, before his constituents, wherever he was, stop him—it doesn't make any difference. Use it again afterward if he attempted to do anything else.

How It Is Done

Senator Wheeler. And when you spoke about having somebody go through Senator La Follette's office, what do you mean by going through his office?

Mr. Means. Oh, search his—find out all the mail that comes in, all the papers, anything that he has got lying around. Find out in his home. Just like you would take—the same principle that you pursue, Senator, when you make a criminal investigation. There is a servant working in this house. If she is a colored servant, go and get a colored detective woman to take her out; have this colored detective woman to entertain her, find out the exact plan of the house, everything they discuss at the table, the family, write it down, make a report. And any information you find that is—report what you find even, and then if it is damaging, why of course, it is used. If it is fine, why you can not use it. It does no damage.

Senator Bruce Gets It Next

Senator Wheeler. Now you also investigated another Senator, did you not, from Maryland?

Mr. Means. Yes; I did. That was just—yes; call it an investigation if you want to designate that.

Senator Wheeler. Who was that?

Mr. Means. Bruce.

Senator Wheeler. When did you do that?

Mr. Means. Oh, that was——

Senator Wheeler. Right after election?

Mr. Means. Yes; right after election. I made inquiries about him; not what you call a regular investigation.

Senator Wheeler. For whom did you make those? Who directed you to make that investigation?

Mr. Means. I don't——Jess Smith or some of them. I knew what they were interested in.

Senator Wheeler. Yes?

Mr. Means. I knew the kind of information that people wanted.

Senator Wheeler. What kind of information was that they wanted?

Mr. Means. Well, if you were running for United States Senator out in Montana, and somebody hired you, and you had stolen a chicken, and I heard of it, and I was working for the crowd on the opposite side, I would try to ascertain all those facts, and let them spring it on you in some speech some night.

Senator Jones of Washington. I understand this was after the election, you say?

Mr. Means. That was after the election. That was general information. The Senator is referring to the fact that I had heard that Senator Bruce was campaigning——

Senator Jones of Washington. I would suggest that he not state what he had heard about it.

Senator Wheeler. No; I am not interested in what you heard.

Senator Jones of Washington. No.

(Concluded on page 14)

The Art of Pitching—The Hub of Baseball

How Major League Pitchers Use Their "Stuff"

By PAUL MACDONALD

Any ball that is pitched wrong may provide the break in a baseball game. Any ball pitched wrong may even definitely decide the result of the game. In the major leagues a pitcher who works through a game pitches an average of 130 balls. This means that the pitcher has 130 chances to make a mistake. The average number of chances that a first baseman gets is fourteen; the infielders rarely get as many as ten chances and the outfielders rarely have five or more, so a pitcher has at least nine times as many chances to go wrong as a first baseman, more than thirteen times as many as his infielders and twenty-six times as many as his outfielders.

BASEBALL hinges chiefly upon pitching. Every angle of play is principally related to pitching. It is the hub of the game, the axis, the stem, the life of it. Pitching is the answer to the query of the intelligentsia: "What has baseball got that demands thinking?"

Pitching is understood by few, misunderstood by many, ignored by an astounding majority. It is the chief cause of managerial woe and heartache. It is an art that has not been mastered by twelve men in more than fifty years.

In the last two years pitching has been much discussed. Managers, players, spectators, enthusiasts, have all spent considerable time talking about it. We have heard frequently, and from men whose word must be respected, that pitching has gone back a long way and that this day does not look upon really good pitchers. The new generation of ball players has lost the art. So they claim, these men of experience who should know.

There is no way of proving whether pitching has greatly deteriorated any more than there is a definite method of proving whether the pitching in the National League is superior to that in the American or vice versa. The fact that hitting increased in the last three years is not so much the fault of the pitchers as of the lively ball, for surely twenty pitchers who delivered well in one year could not all collapse at the same time in the following year. It is possible, of course, but extremely doubtful.

Managers who make the claim regarding the deterioration of the business of flinging, probably base their conclusion upon the youngsters coming up. They are not of the same quality as were the fixed stars of the present day when they broke in before the day of the lively ball. They lack the thoroughness, the eagerness and the concentration that was shown by pitchers formerly.

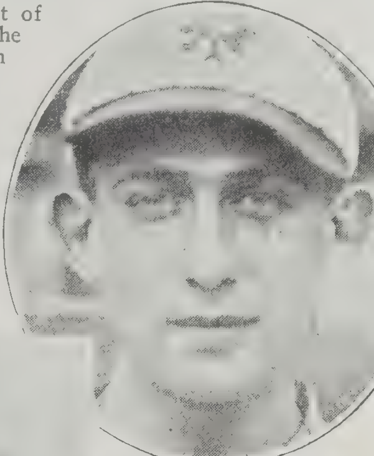
We cannot share the pessimistic opinion regarding pitching. We believe there are many good pitchers but that these pitchers must adjust themselves to a new style of pitching. This most of the experienced twirlers are doing. It takes time to make an adjustment that covers such a complete range of baseball territory, and therefore the results will be achieved gradually.

However, the lively ball and its attending troubles have made pitching more interesting, if anything. It has made the battle of wits between the batsman and the pitcher more acute and has strained the resources of the twirler. It has added worries and problems to the man on the pitching hill, and his struggle to overcome the new difficulties has carried its fascination.

Pitching always was and always will be fascinating to the student of baseball. Here lies the strategy of the game. The pitcher bears the same relation to baseball that the quarterback bears to football except that the pitcher must depend chiefly upon himself while the quarterback can swing ten men in any direction where he wants to launch the attack. Baseball is much more dependent upon the individual, which gives baseball its great edge in popularity over football, but that is all another story and quite a long one.

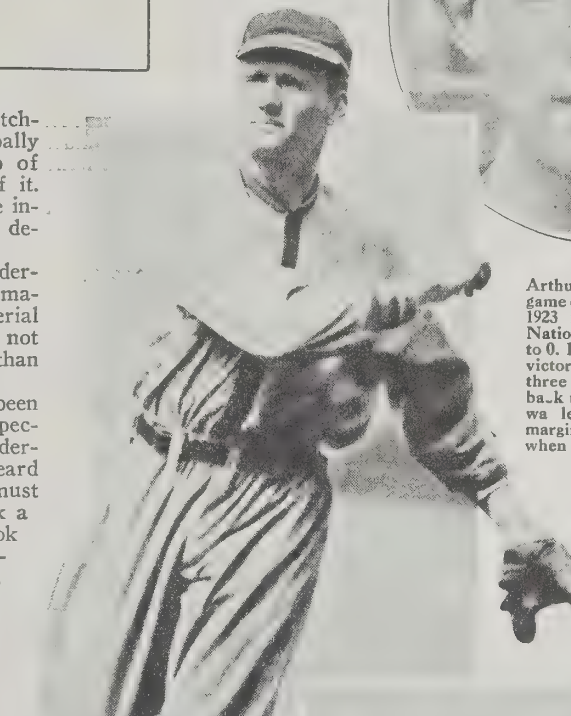
Men recognized as great pitchers will frankly confess that they are constantly learning new things about pitching. They will continue learning as long as new players enter the game. Each player presents a separate and distinct problem to the pitcher. No two men were created exactly alike and no two men bat exactly alike; each has his individual traits; each goes to the plate to hide something from the pitcher.

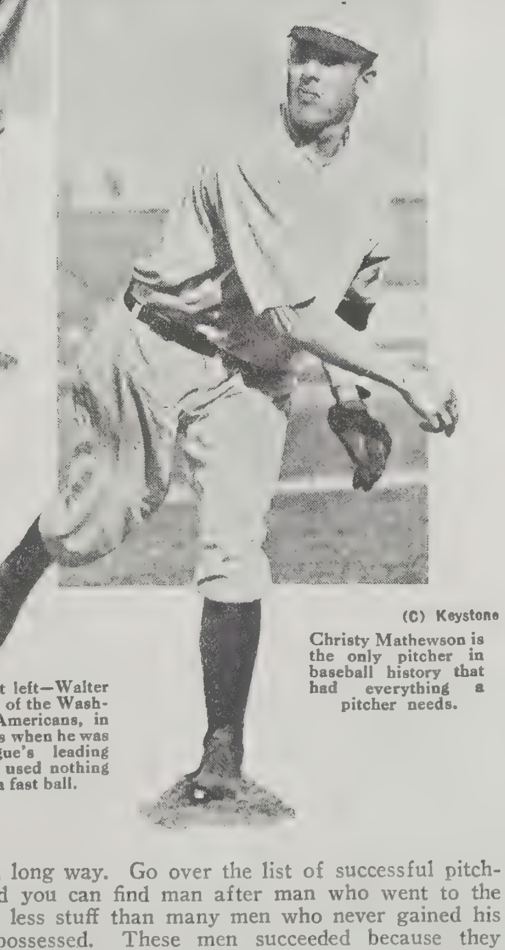
To the average man pitching means the possession of what the profession and its followers refer to as "stuff." Nearly all those who read this know what "stuff" means —a sizzling fast ball, a quick-breaking, deceptive curve, a slow ball that moves so slowly that the batsman can almost count the seams, a change of pace, control. That is "stuff" in a pitching sense. But more than that is required, for a pitcher may have all these things and still cannot become an outstanding star. Pitching, briefly, consists in giving the batter what he does not want at a time when he does not want it. To do this a pitcher must necessarily have control and he must have a fair amount of stuff, but some of the greatest pitchers in history have got along with little stuff. A pitcher using what he has at the proper time will go a long, long way. Go over the list of successful pitchers and you can find man after man who went to the top on less stuff than many men who never gained his level possessed. These men succeeded because they pitched intelligently, because they put much thought behind each pitched ball. They are far greater than the men who try to fool the batsman by the amount of stuff they have on the ball.



(C) U. & U.

Arthur Nehf won the third game of the world series of 1923 for the New York Nationals by a score of 1 to 0. He accomplished the victory by pitching ninety-three curve balls. Sent back in the sixth game, he was leading by a three-run margin in the eighth inning when his arm suddenly "went dead."





(C) Keystone

Christy Mathewson is the only pitcher in baseball history that had everything a pitcher needs.

Above at left—Walter Johnson of the Washington Americans, in the years when he was the league's leading pitcher, used nothing but a fast ball.

In the year that Jim Bagby was the chief factor in Cleveland, winning a pennant and world's championship (it was 1920, in case you should ask) he won thirty-one games, and that year Jim Bagby was supposed to have less stuff than half the pitchers working in the American League, but Bagby knew how to pitch. He won because he always gave the batsman the kind of ball he was not expecting Bagby to pitch. That is real pitching.

When "Wee Willie" Keeler gave his immortal advice to batsmen, "Hit 'em where they hain't,' a great pitching contemporary might have added, "Pitch 'em where they hain't lookin' for 'em."

We have seen reputed fast ball pitchers go through nine innings without throwing a fast ball, famous curve ball pitchers go the same distance without once resorting to a curve and noted spit ballers go the route without once moistening the ball. And each won his game. Why? Because every batter who faced him was constantly looking for the ball the pitcher was noted for and the pitcher never threw it.

Christy Mathewson is unquestionably the greatest pitcher of modern times. Mathewson will remain a pitcher's pitcher just as Velasquez was a painter's painter. Mathewson was a model for all pitchers. In him one found the composite of all that makes pitching. Future generations will undoubtedly refer to Mathewson as the greatest of all time, the perfect pitcher.

National Leaguers who batted against Mathewson when he was in his prime have told us that he had the fastest fast ball of any pitcher in the National League, and the best slow ball. He certainly had the greatest curve ball ever known to the National, for his famous fade-away delivery comes under the heading of curve ball pitching. Mathewson had control. But, above all else, Mathewson knew the batsmen, studied them and centered his pitching on the individual. He made them go after what they did not want to go after, gave them the kind of ball they did not like when they did not want it. He was, above all, in his pitching ability, intelligent.

The fade-away still lives in the memory of baseball, but Mathewson rarely used it. The mere fact that he had it was enough. This knowledge put the batsmen under a mental hazard. Any time Mathewson was in a hole the batsman expected the fade-away. Mathewson did not have to use it often for this reason. In many games he did not use it at all, rarely more than three or four times, never more than ten. He once said that if he pitched a dozen fade-aways in one game he would ruin his arm.

There are good pitchers who would have been great pitchers with any two of Mathewson's several deliveries. Grover Cleveland Alexander, the best pitcher in the National League, immediately following the reign of Mathewson, used but two kinds of delivery, a fast ball and a curve. Ed. Walsh rose to the heights with little more than his famous spit ball. Walter Johnson never had a thing but a fast ball when he was the reigning hurler of the American League. But Mathewson has everything. His fade-away alone would have given lasting fame to another pitcher. He threw it as a left-hander throws a curve. It traveled toward the plate, appearing to the batsman like a "straight" fast one, and just as the batter was set to swing, the ball would break, sweeping out or in (all depending upon whether the batsman stood on the right or left hand side of the plate). The fade-away not infrequently carried a break of three feet, which is a record break for a curve ball.

Mathewson was hit hard in many games, but that was not against his wishes. Many of our leading pitchers work the same way. They bear down only when the occasion demands it. A pitcher with a good fielding team behind him plans to make the batsman hit, for the percentage is then all with the fielding team. Whenever the opposing team threatens to score, the pitcher bears down. Some pitchers bear down through an entire game when the score does not demand it, but they last only a short time.

Pitching style has a great deal to do with what a man pitches. One of the most desirable deliveries is a slow ball. It comes in handy. A change of pace is possible only with a slow ball and some pitchers have become stars simply through an excellent change of pace. But a side-arm pitcher finds it almost impossible to throw a slow ball and few side-arm pitchers carry a change of pace. Those that have it are not highly successful. Alexander, who gained fame with a curve ball and a fast one, was strictly a side-arm pitcher.

To make the batsman go after the ball you want him to try to hit is one of the most difficult things with which a pitcher has to contend. Batsmen are patient fellows all too often, and pitchers are not extremely fond of the patient type at bat; they prefer those anxious to hit. The fellow who is just prancing for a chance to get a crack at the ball is the fellow the pitcher glories in having at bat.

With the home team a few runs behind in what the American people recognize as the lucky seventh, we have seen thousands go into wild enthusiasm as the umpire called "Ball one," and then "Ball two." From grandstand and bleachers came the great battlecry of the rooter, "Can't get 'em over," over and over again. And then—the batter, having a toe hold, swings on the next one, a ball pitched in the groove, and hits a dinky roller which results in an easy out at first while the crowd sighs and slumps into gloom.

There is at least one pitcher who purposely pitches two and even three balls, sometimes wide, to make the batter hit the ball he wants him to hit. Risky business, you say. Not so risky for a pitcher with absolute control and confidence. Give this pitcher a batter that is anxious to hit and he never pitches any other way. He is willing to let the batter go after a few bad balls. If he hits them he will no more than foul them off and the pitcher has the advantage anyway. If he does not

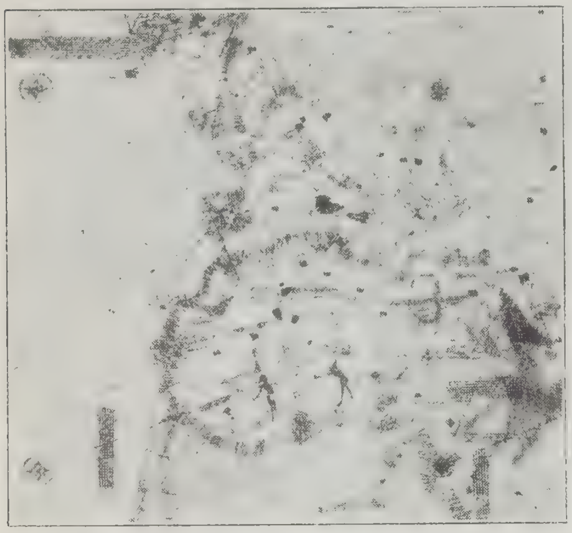
New Light on Christopher Columbus

By LOUIS C. KARPINSKI

IN APRIL of this year, 1924, M. de la Roncière, a librarian in the National Library of Paris, came upon a map there which bears conclusive evidence that it was inspired by Columbus. This map represents the Cape of Good Hope discovered by Bartholomew Diaz in 1488 and contains nothing of the new world. The map must have been produced in the interval between 1488 and 1492.

The evidence that the map directly emanates from Columbus, if it was not actually drawn by him, is found in a number of descriptive notes which appear upon it. Here we have repeated, word for word, long Latin phrases which Columbus himself placed upon the margins of a copy of an old geographical work that he had. This work is called "The Image of the World," or "Imago Mundi," by Peter D'Ailly.

Ferdinand Columbus, the son of the great admiral-discoverer, was an enthusiastic book-lover and collector. At Seville he founded a library in which were placed many books collected by him and a number which had belonged to his father. These volumes which belonged to Christopher Columbus have autograph marginal notes which are characteristic of his mind.



The original map is about two feet by three feet, with the smaller map of the whole world attached at the left side. The form is that of a portulan or seaman's map. The description of the Antilles is so faint that it is necessary to ink over these lines which are added in the upper left-hand corner. The names on the coast are only occasionally legible in the reduced chart. However, several of the desert routes indicate knowledge which was not reflected on most maps until much later.

One of these notes in Latin reads as follows: *"Celum est figure sperice. Ymago seu mapemundi, licet figuretur in plano, tamen debet imaginari in sperico."* "The heaven is in the form of a sphere. And the representation of the world may be depicted in a plane but it should be thought of as a sphere."

This note, in these words, appears also as one of the descriptions on the newly discovered map, and is thought to identify it "as with the signature of Christopher Columbus."

Other peculiarities such as spelling Asia as "Assia," were parts of Columbus' habit and are also found on this map.

Several points of interest are to be noted in connection with the map. First, Christopher himself and his brother Bartholomew were cartographers, professional makers of maps. The map is thought to be from the hand of one or the other of them.

In the second place the map gives the Italian name as well as the Latin of the Cape Verde Islands, "Cavo Verde," and states that their discoverer was a Genoan, by name, Antonio de Noli. This is valuable direct internal evidence connecting Christopher with Genoa and testifies to his Italian origin. Elsewhere in his writings now published Christopher refers to these as the islands of Antonio.

Thirdly, one descriptive note which is only faintly visible refers to silver as being found in the sands of the "island of the seven cities," the fabled Antilles which appeared on many early maps and to which Columbus elsewhere makes reference. M. de la Roncière concludes that this was the island and the silver which Columbus sought. However, other documents show that Columbus sought the mainland of Asia and the island of Cipangu or Japan which he believed contained gold, silver and pearls.

The island of Iceland and even an indication of Greenland appear upon the map. This may possibly be regarded as confirming direct acquaintance of Columbus with Iceland, particularly as a rather long note is given in the map on the subject, referring to the snow and ice.

The study of the various long notes on the map will doubtless give further confirmation of the Columbus connection.

After more than four hundred years the first map, directly and quite indisputably connected with Columbus, accidentally comes to light.

Less than a year ago the British Museum acquired an Italian world map of 1506, the first printed map depicting the new world.

About twenty years ago the great Waldseemüller map of 1507, the first with the name America upon it, was discovered in a collection in Germany.

All of these are priceless documents, ranking well among the most valuable documents of the world. The possibility of discovery of such documents constitutes one of the greatest charms of the study of history. The unsolved historical problems, even about Columbus himself—Where was he born? Where do his ashes rest? Where are his maps?—constitute a challenge that leads men to devote their lives to the solution.

Government by Espionage—How It Is Done

Concluded from page 2

Senator Wheeler. I am interested in the fact that you made an investigation of different Senators.

Mr. Means. Yes.

Senator Wheeler. And among those that you made was one of Senator Bruce of Maryland?

Mr. Means. No; I wouldn't say that I exactly made an investigation of Senator Bruce of Maryland, Senator.

Senator Ashurst. Well, you were asked to make an investigation of Senator Bruce?

Mr. Means. Yes.

Senator Ashurst. You were asked to make an investigation?

Mr. Means. Yes.

Senator Wheeler. Now, by whom were you asked?

Senator Ashurst. Yes; by whom?

Mr. Means. I don't recall whether that was Jess Smith, Underwood, somebody up in the Department of Justice, some politician, or who it was.

Senator Wheeler. Now there is only one general question that I want to ask you, and that is with reference to another specific case. I am not going into the details of it at this time, but will on the next examination of you. And that is with reference——

Last of All, the Investigator Himself Gets It

Mr. Means (interposing). I will tell you how you can find out about all these statements, something you can investigate. They have got my telephone wires tapped. I run three bells on my telephones to be able to tell when they tap them. I can tell in a moment when they tap them, and then I use two telephones. And I know what the average investigator is going to do. He is going to sit down and he is going to listen to the telephone they have assigned him to watch and to tap, and I will get my father-in-law to call up on one, and me on the other, and they can not listen on the two phones at the same time. When I put three bells on a telephone—electric current won't ring more than three bells; now the moment they tap in and ring in the fourth bell one of your bells will keep quiet; then you can depend on the fact that your telephone is tapped; I have tapped them myself. I know how to tap, and how to keep from being tapped. But it is going pretty far when they tap a man's wire and keep him from talking to his counsel.

Our Individualism Its Strength and Danger

Concluded from page 2

The new individualism must have a new vision of

"The things that the individual
Must sacrifice for the good of all."

The new individualism must not rob. It must retain all the benefits which make individualism one of the outstanding characteristics of the American people. It must recognize the divine dignity of the individual spirit. It must retain for every person his right of choice in belief and action. It must retain the stimulation of a hard, close race—"the game." It must retain the satisfaction of a victory. It must allow the earned reward of success founded on ability, training and endeavor.

But the new individualism must recognize individual worth for service—not for self-gratification. "A man should know himself for a necessary actor. It is not for him to account himself cheap and superfluous, or to linger by the wayside for opportunities. Did he not come into being because something must be done which he and no other is and does?" said Emerson. Each individual clothed with the dignity and the opportunity of the highest development for his own mission of service to society—this shall be the keynote of the new individualism. Its emphasis shall be on individual duties rather than on individual rights.

This *new individualism* belongs to men of a developing order higher than the old individualism. The old individualism is founded on the animal biological struggle for existence. It becomes more than the animal struggle for existence, however, for seldom is the American survivor sated. He still wants more, and ever more for his own gratification—for his own development. The old individualism is fierce, ruthless, deadening.

The *new individualism* must be more and more a matter of the spirit. It must have a new and more spiritual conception of the relation of the individual to the family and to the state.

There must be a new assumption on the part of every citizen of individual responsibility toward the laws and institutions of the government that alone grants us our liberty. In the old individualism most men saw chiefly their own rights, and they got them, if necessary, by the power of individual might. In this new individualism men must be made to see that every other citizen has equal rights with themselves, guaranteed mutually between themselves. So this new individualism puts personal citizenship duties toward every other citizen's rights side by side with personal citizenship rights. I have no rights, if you do not do your duty faithfully to your guaranty. You, in turn, have no rights, if I do not do my duty faithfully to my guaranty. We must thus have crystallized a stern public opinion, setting itself like flint against transgression of the law.

"If we fail," said Roosevelt, "the cause of free self-government throughout the world will rock to its foundations."

I believe enough in the existence of genuine spiritual life in our people to think that America will catch the spiritual vision of the *new individualism* and that she will not lose sight of that vision.

The Art of Pitching—The Hub of Baseball

Concluded from page 13

go after them, and chances are that he will not, the pitcher forces the batsman to get set. When he knows the batsman will swing, he feeds him the kind of ball the batsman most dislikes, the kind that he finds next to impossible to hit. The pitcher was simply preparing the situation where the batter would be forced by circumstances to go after the pitched ball, for the circumstances pointed to the pitcher having lost control and grooving one to get out of a hole. That is what the pitcher wants the batter to think. He wants to make him believe that he is sending up what the profession refers to as a "cripple." Every batter likes to hit "cripples." But the "cripple" of this pitcher is the most effective strike ball he can serve the particular batter on whom he is operating. All great pitchers are men who can pitch strikes when they have to.

The advantage is not always with the pitcher. Pitching records will show that the advantage is more often with the batsmen. As the intelligent pitcher studies every batsman closely, so every intelligent batsman gives the same amount of attention to the pitcher. The batter has his peculiar habits, individual traits at the plate, but the pitcher has his also, in the box. It is a two-way affair at all times.

Nearly every pitcher has some telltale sign. It is the duty of the batter to discover what this is. Certain pitchers have certain peculiar motions when pitching certain kinds of balls. A pitcher whose hand will be loose when he is about to throw a curve ball will suddenly tighten and grip hard the ball when he has a fast one to serve. The hands, the forearm, the fingers (when visible), the leg, foot, shoulder, the elbow and even the head can tip off what the pitcher has decided upon for the next delivery. Discovery of these individual movements and the interpretation of them has defeated many pitchers who otherwise could not be solved. In pitching, deception is the great thing.

You have seen certain pitchers break loose one season and pitch wonderful ball. Frequently a recruit will come in and be a sensational pitcher in his first season. Then, in his second year, this same pitcher will fail consistently. The reason is simple enough: In his first year the pitcher had a certain delivery that made him successful. As clubs went against him time and again and batters studied him more and more and experimented against him, they finally discovered how they could overcome the thing that puzzled them. Maybe it was by a certain position at the plate, maybe by changing the style of hitting; for you can rest assured that as soon as a new pitcher starts winning consistently the batsmen will begin their experiments.

Two of the leading pitchers in the American League were the two Urbans—Faber, of Chicago, and Shocker, of St. Louis, each an excellent pitcher, with plenty of stuff and unusual pitching intelligence. Faber would have won many more games in recent years if certain batsmen had not discovered that he did not like to be crammed. To cram Faber the batsmen hugged the plate. With the batter on the plate Faber was forced to change his delivery and lose effectiveness, or enough to beat him in close games. To beat Shocker the batter got as near him as possible, toeing the front boundary of the batters' box. This position forced Shocker to deliver lower and the result was a lack of control. So, against Faber, you can see batters who prefer to be as far as possible removed from the plate, crowding it and against Shocker batters who usually stand far back in the box will be running up on the pitcher.

It is difficult for a pitcher to conceal his weakness from a club just as it is hard for a batter to conceal his weakness from an intelligent pitcher. A ball club may be generally regarded as stupid (and certain ball clubs in the major leagues are known to be strictly "dumb") but every club, no matter how lacking in intelligence generally speaking, will have at least one intelligent and observing player who will make the observations for the entire squad. His findings immediately are made the foundation upon which the club builds its attack.

Pitching is far from a lost art. The difficulty is that too many pitchers do not give the time, the thought, the energy and concentration necessary to success in pitching. With the vast majority of us in any line the easiest method is always the best. The easiest method is generally just the easiest and nothing more. There is no position in baseball where so much thought is demanded as in pitching.

Charlie Chaplin once told us that nobody likes to work. None of us, he added, would work if it was not work that kept us from starving to death. So, there is that excuse for the pitcher. Many youngsters dislike the idea of spending hours and hours working on a certain delivery, more hours in learning how to control it and then spend all the time possible during the playing season studying batsmen and discovering how to overcome them. We believe that the pitchers entering the major leagues now do not give the deep thought to the job that the stars of the yesteryears gave. They are not thorough in their deliveries, meaning that they have not mastered them thoroughly. They try to accumulate a variety before they have thoroughly mastered one. They have a dab of this and a dab of that but a sound whole of nothing. In one of the crafts a boy, wishing to learn, must serve as an apprentice for years, master thoroughly all the details, get a solid foundation and achieve a thorough working knowledge before he can appear as a craftsman, and pitching certainly is an intricate craft. Baseball needs, we feel, an apprentice school where ambitious young men will be thoroughly schooled for a few years before starting out. Many pitchers spend more than half their careers acquiring the knowledge that they should possess before coming to the major leagues.

Pitching is the most essential part of baseball. Good pitching can make a poor team win, poor pitching can make a good team lose. And, as long as baseball is played, the pitcher will hold the whip hand when the teams take the field.

Peonies and Pioneers Make Faribault Famous

Riot of Gorgeous Color Greets June Visitor

By LOUISE W. MEARS

Peony Marie Crousse.

TRULY many towns, like many people, are quite unaware of their personal charm. It falls to someone, a friend or a stranger, to bring to notice their attractiveness and proclaim that which modesty or indifference has withheld. A traveler coming to Faribault, Minnesota, in June when the peonies are in bloom, exclaims, "Why hasn't everybody heard of Faribault peonies? Why not *Faribault peonies,* and why always Pasadena posies and Miami magnolias?"

How many people, even in Minnesota, know of Faribault as the home of the Brand peony, that captures the prizes at the flower shows, that is shipped to distant parts of the world, and commands for a single root a price sometimes written in three figures. Will the fame of the tulips of Holland not be repeated here? The glory and the fragrance of the red, pink and white peony fields in June offer a theme worthy of elaborate publicity.

The peony is the epitome of Minnesota, and particularly Faribault, skies and soil. Its beauty is not the product of irrigation on the reclaimed desert, or of the imported fertilizer on sterile soil. Its glory flaunts the song, "I am a product of all I survey. My right there is none can dispute. I am a child of cold winters and cool summers. My blood is red."

In the muck, where water-loving willows mingle with the flowers, the iris thrives in a hundred varieties. You would not marvel at the statement that a hundred varieties of iris may be seen at the Royal Kew Botanical Gardens, perhaps, but are you ready to yield your credulity to the *Faribault* nursery?

Faribault is an old town. But its history still lies near the surface, like outcrops of gold in the mountains, and seems fairly to beckon and plead for a historian. The oldest house still stands, erected by Alexander Faribault, the founder of the town, in 1853. Born of French parentage in Prairie du Chien, he established a trading post at the foot of Cannon Lake in 1826. Edward Eggleston, of Hoosier schoolmaster fame, was in Faribault as early as 1855 taking pictures, and here secured the tragedy for his novel, "The Mystery of Metropolisville."

The Chicago, Milwaukee & St. Paul Railway reached Faribault in 1865. Then came the Chicago Great Western, followed by the Burlington and Rock Island railways. Faribault was the home of the railroad contractors, the Grant brothers, who are credited with having built more miles of railway than any other firm or individual in the United States (1901).

A cathedral of surpassing beauty, built of limestone from Faribault quarries, speaks of that epoch in church history when the young Bishop Whipple chose Faribault as the See City, in 1860. The inscription on the bell tower reads:

"This tower is the thanksgiving of many people for Henry Benjamin Whipple, first bishop of Minnesota, and is the symbol before men of the supreme value of a righteous man."

The biography of Bishop Whipple is the missionary history of the Northwest, recorded in landmarks of Episcopal schools, Indian chapels and missions. He loved the Indians with an intense love. When the government gathered all the Chippewas at White Earth, Minnesota, his visits to them in the summer were among the happiest occasions in his life and theirs.

Here are further evidences of historical interest in Faribault—an active French community, an Irish settlement, German pioneers in predominating numbers, each nationality unified by a church center and a parochial school. French and German may be heard on the streets and in the pulpit. These facts are somewhat remarkable, since Faribault is smaller than the average American city where national groups have survived the unifying influences. The hills and dales, and the Cannon and Straight rivers flowing through the town, provide commanding locations for institutions and sheltered sites for modest cottages. And Faribault is veritably a home for institutions. On the high land, east of the Straight River, are the state institutions for the blind, the deaf and the feeble-minded, where the afflicted may have at least all that nature has to offer in healthful, beautiful surroundings.

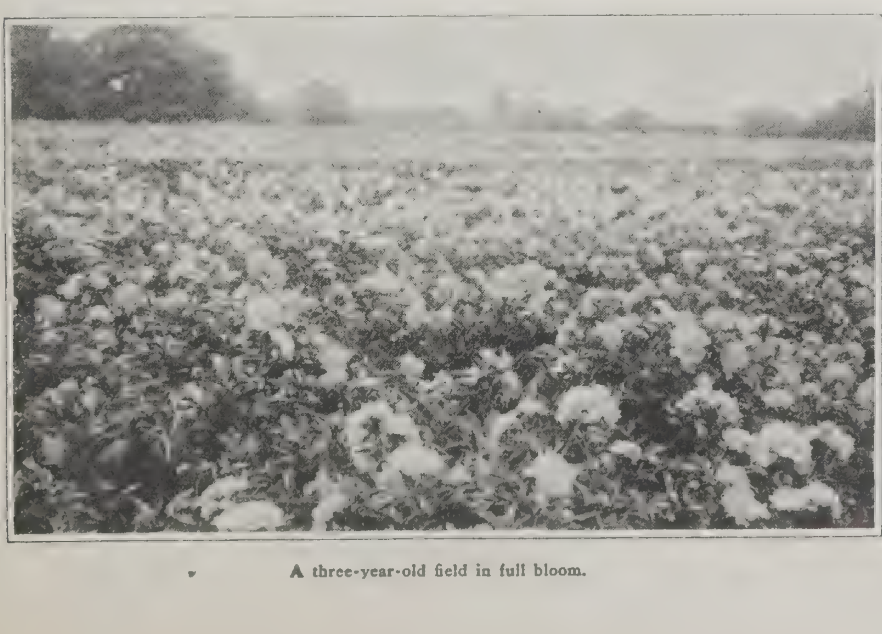
Partial view of the Brand Peony Farms taken from the air.

In the hardwood forests that crown the bluffs are located Shattuck Military Academy, St. James Preparatory School for Shattuck, Seabury Divinity School, and St. Mary's School for Girls, all institutions either founded or fostered by the noted Episcopal Bishop Whipple. With this background of religious history, there now has sprung up a summer school for religious workers, now in its second year, where a study of "Religious Drama and Pageantry" closes with an outdoor pageant.

In spite of its varied institutions and nationalities. Faribault, a thriving little city of 11,000, is far from being the scene of confusion. The peacefulness of the landscape in June suggests a pastoral painting rather than a market scene. Business does not flaunt itself upon glaring billboards. It does not need to, for it is in the hands of pioneers whose names guarantee their product. There is a well-established, prosperous shoe factory, a woolen mill, creamery and cannery, flour mill and furniture factory. St. Paul is fifty-two miles away to the north.

And within walking distance of the town ten charming lakes may be reached, lying in pockets between the rounded glacial hills, where the fishermen are the townspeople and where neighbors get together. If fishing were good for nothing else than to keep alive the old-fashioned state of mind, now popularly known as the community spirit, it would still be worth while to re-stock the waters. But the fish are very good to eat and furnish a pretext for many hours of sitting in a boat or leaning expectantly over a bridge-railing. Industrial unrest and labor troubles are not easily fostered in a community where every man at his own pleasure may fish in a silver lake, and grub in his own vegetable garden, and cultivate his own peony bush if it be his heart's desire.

Although the peony has rivals in our Southern states and in California, it is *the* flower for the northern part of the United States and the southern part of Canada. Here it is unequaled for furnishing masses of color for landscape effects. No flower excels it for interior decoration. It is also unequaled as a cut flower when beauty of the individual bloom is the chief consideration.



A three-year-old field in full bloom.

Three-year-old field of the famous French peony, Mons Jules Elie.

URBANA ILL

BRIEFLY TOLD

John Bryan, of Riverside, Ohio, swore that the great trees which forested his estate of 500 acres should never fall the victim of man's greed for money. To make certain of this he had his trees heavily rifted with spikes that would bring grief to the best steel saw.

Of the 54,421,832 citizens entitled to the vote in 1920, only 26,786,753 voted.

Out of every consumer dollar paid for meat in successful retail markets, seventy-six cents goes to the packer or wholesaler; nineteen cents goes for dealer's expenses; and five cents represents the dealer's profit.

Izaak Walton's cottage at Shallowford, near Stafford, England, has been restored and is now open to the public.

Fridtjof Nansen gives it as his opinion that the inhabited parts of the Greenland coast by right belong to neither Norway nor Denmark, but to the Eskimos, and that their well-being should be the first consideration. He declares that perhaps it would be best for foreigners to stay away and let the Eskimos live in peace.

An excellent and valuable pulpwood is being made from the ailanthus tree, known to the Chinese as the "tree of heaven," and imported from China into Pennsylvania and New York, where it is rapidly becoming a weed.

Auctioning off an army base at Port Newark, New Jersey, recently, the government could only get one bid—$3,500,000—from a man who declined to make known his name.

In the recent Italian election Mussolini polled 4,600,000 votes to 2,500,000 votes recorded for all other groups combined, and 379 Fascisti have been elected to the Italian Chamber against 160 members of non-Fascisti parties.

In the rural sections of America—notably the East and South—the average age of the physicians ranges from fifty years upward, while almost no young men are coming in to take the places of those who are passing away.

"Almighty God, we make our earnest prayer that Thou wilt keep the United States in Thy holy protection; that Thou wilt incline the hearts of the citizens to cultivate a spirit of subordination and obedience to government, and to entertain a brotherly affection and love one for another and for their fellow citizens of the United States at large."—Part of Washington's prayer for the United States.

The vagrant children in Moscow and its suburbs number about fifty thousand, according to the *Pravda*.

A memorial window designed especially in honor of Joseph Jefferson, the actor, will soon be placed in a wall on the sunny side of "The Little Church Around the Corner" in New York City.

In 1922 forest fires destroyed the equivalent of a ten-mile strip extending from New York City to Denver.

"The International Jew," a four-volume series on the Jewish Question, may be obtained from The Dearborn Publishing Company, Dearborn, Michigan. This set includes:

"The International Jew," Vol. I, 235 pages; "Jewish Activities in the United States," Vol. II, 256 pages; "Jewish Influence on American Life," Vol. III, 256 pages; "Aspects of Jewish Power in the United States," Vol. IV, 246 pages. The price of these volumes is twenty-five cents each; the complete set, four volumes, one dollar.

BINDERS

Readers who desire to save their copies of The Dearborn Independent can now obtain a specially constructed cloth covered post binder. This binder is very practical, holds 52 issues and permits immediate reference to or removal of any copy without disturbing any other issues. Price $2 each delivered. Remittance must accompany orders.

Iceland has decided to return to the primitive life. In an effort to improve the value of the Icelandic crown it has decided to prohibit the importation of ready-made clothing, shoes, bread, butter, margarine, cheese, salt, fruits, leather and in fact nearly everything manufactured by civilized man.

The blue whale sometimes attains ninety feet in length and 140,000 pounds in weight.

Roman messengers, speeding to the ends of the empire, changed tired horses for fresh at relay stations on the roads to Britain, Gaul, Germania, and Spain. These stations were called "posta," from which term we get "postal," "postage" and "post office."

The poet laureate of England gets a yearly salary of $360.

The new Russian Soviet Navy flag has a red field with a white circle in the center, from which radiate eight white rays, two perpendicular, two horizontal, four diagonal. Inside the circle is a large five-pointed red star upon which is emblazoned a hammer and sickle in white.

Lunch is served every Friday noon at 44 John Street, New York City, the oldest Methodist church in America, for the convenience of the 800 business men and women who attend the noonday service.

The Japanese Government has appropriated $1,000,000 "to establish a system of peasant proprietors," according to the newspaper *Hochi*. It is proposed to loan this money in parcels of $2,000 to farmers on a thirty years' amortization basis.

A Czech engineer has invented a glass that may be blown into a hollow sphere and kicked about like a football, molded into a tumbler, heated to the point where pieces of paper in the tumbler are charred, plunged into cold water and still not break.

Our annual freight bill on lumber is $250,000,000.

The Eskimos prefer the wolverine fur, which is said to be the only fur that will not frost when breathed upon.

The Kingdom of the Netherlands, one time lenders to the whole world, recently concluded negotiations with an American banking syndicate for a $40,000,000 loan—its first external borrowing on a dollar basis.

When the water temperature is below thirty-two degrees, sodium sulphate is surrendered in large quantities on Great Salt Lake. A harvesting, desiccating, and refining plant has been established and the company operating keeps in touch with the weather bureau which governs the output according to information received.

The R. N. W. M. P., heretofore known as the Royal Northwest Mounted Police, are now known as the R. C. M. P.—Royal Canadian Mounted Police.

"The Latin-American jingo is he who tries to stampede the people of the Southern Republics with horrendous tales of imperialistic design on the part of the United States. Those of us who have investigated the subject are supremely confident that the United States entertains no such design, but that paz, commercio, y amistad (peace, commerce and amity), are the guiding stars of this country in its relationships with ours."—*Señor Manuel Giron,* former official of Guatemala.

Alois Lang, of Manitowoc, Wisconsin, who ranks among the foremost of America's wood carvers, is working on a block of oak taken from the timbers of York Cathedral in England, which was built 900 years ago. He is making beautiful panels to be placed in the sanctuary and chancel of St. Paul's Cathedral in Los Angeles. Records in England show that the oak timbers were given by William the Conqueror to Bishop Walkelin during whose episcopate the edifice was erected.

More than a quarter of a million letters are expected to be carried each trip on the weekly Spain-Argentina air line service to be inaugurated soon. Each trip will average three or three and a half days as against a fortnight by water.

Within a year the dry navy will be augmented by twenty destroyers, two mine sweepers, 223 seventy-five-foot cabin boats capable of eighteen knots an hour and one hundred thirty-six-foot speed boats.

A newspaper 144 years old has been found among some possessions inherited from his ancestors by an Orange County, New York; man. The paper is the New York *Packet and Advertiser* bearing the date of October 14, 1779. It was printed in Fishkill, New York, during the Revolutionary War.

>
> "This branch of the government will have the weight of the conflict on their hands because they will be the last appeal to reason." —*Thomas Jefferson*

IT IS singular that those who always express concern about the present or future quality of the federal bench, should ignore such a common-sense requisite as the *competent salaries* insisted upon by Jefferson.

The United States is the stingiest employer of incorruptible judicial talent, although we boast of being the richest nation.

However, the situation arising out of this unworthy parsimony involves more than our pride and self-respect. It involves nothing less than the continued possibility of obtaining men big enough for these very responsible posts.

The proposal now before Congress to pay federal district judges the same as the state judges in their respective districts with a minimum of thirteen thousand dollars, and also suitable adjustments of the circuit judges' pay, suggests the value of a comparison of our judicial salaries with those of the British Empire.

A Few Comparisons

OUR legal and judicial institutions are derived from England, but we have not safeguarded the position of Judges as the British Commonwealth has done it.

(a) The six Lords of Appeal in Ordinary of the House of Lords each receive six thousand pounds a year, about $30,000. The Master of the Rolls who heads the Court of Appeals receives the same amount and the five Lord Justices of this court each receive five thousand pounds, or about $25,000. These two courts correspond to our Supreme Court.

The Chief Justice of the United States Supreme Court is paid $15,000 and the Associate Justices each receive $14,500.

The comparatively low salaries of the Supreme Court are not all of its enforced economy. The justices are not even provided with chambers in which to ponder briefs and prepare their opinions. This momentous work has to be done in their private houses.

(b) The British High Court of Justice corresponds to our Federal Circuit Court of Appeals. It is presided over by the Lord High Chancellor, who receives six thousand pounds a year for this service and also four thousand pounds for sitting on the Woolsack as the Speaker of the House of Lords, or about $50,000 in all. The six Justices of this Court each receive five thousand pounds a year, or about $25,000.

While the term of English judges is for life, the Lord High Chancellor goes out with his political party and is pensioned five thousand pounds ($25,000) a year for life as compensation for certain restrictions which his having held official office has placed upon his private law practice.

The Circuit Judges of our Federal Courts of Appeals, whose decisions are final in many causes, each receive $8,500 a year.

(c) The Kings Bench Division is the parallel of our Federal District Courts. The justices each receive five thousand pounds a year and their work is directed by the Lord Chief Justice of the court, who is paid eight thousand pounds (about $25,000 and $40,000 respectively).

The district judges of our Federal courts each receive $7,500 a year. A controlling reason for Congress fixing at this figure the salaries of these judges, who make up the bulk of the federal judiciary, was the unwillingness of some Congressman to pay any federal employe more than they themselves receive.

In the debates upon the last increase a member declared amid applause: "It is preposterous, this idea of running up the salary of a federal judge to ten thousand dollars when members of Congress and Senators, who have succeeded Webster and Clay, receive only $7,500."

What Webster Thought

WEBSTER had a higher opinion of the federal courts when he summed up his famous speech by exclaiming: "Here is a law (the Constitution) which is declared to be supreme and here is a power established which is to interpret that law."

The Scotch and Scotch-Irish are esteemed as frugal people, yet they pay their judges much more than ours receive.

The Lord Justice General of Scotland is paid five thousand pounds and his three Associate Justices of the Inner House each receive thirty-six hundred pounds a year. The Lord Justice Clerk of the Second Division is paid forty-eight hundred pounds and the three justices each thirty-six hundred pounds. The five Justices of the Outer House each receive thirty-six hundred pounds. These correspond to our Supreme, Circuit and District Federal Courts, respectively.

Ulster or Northern Ireland pays her Lord Chief Justice five thousand pounds, two Associate Justices four thousand pounds and two others thirty-five hundred pounds each.

The Dominion of Canada pays its judges of the rank of our District Federal judges $9,000 a year, twenty per cent more than the Yankees, although Canada is not as wealthy as the States.

The judges of India who correspond to our District Federal judges, are paid forty-eight thousand rupees a year, roughly $24,000.

The Malay States and the Straits Settlements pay them $14,400.

Bryce's Picture of the Judiciary

AUSTRALIA pays its Chief Justice $17,500 and his associates $15.000 each. The judges akin to our Circuit and District Federal judges receive from $13,000 in New South Wales to $8,500 in Western Australia.

The Dominion of New Zealand pays $10,000.

South Africa pays its Judges of Appeal $16,250 each. Its judges who render the service of our District Federal Judges are paid $11,250 each and their presiding judges in the Cape of Good Hope and the Eastern Districts each receive $12,500 and in the Transvaal $15,000.

The American Bar Association is going to visit London this summer. It is not likely that many federal judges will be able to afford this pilgrimage to the shrines of Blackstone and Coke. While the American lawyers are being officially received in Westminster Hall, the ancient seat of British judicature, they will doubtless recall James Bryce's picture of the judiciary with whom they are becoming acquainted:

> "For some centuries Englishmen have associated the ideas of power, dignity and intellectual eminence with the judicial office; while a tradition shorter, no doubt, but still of respectable length, has made them regard it as incorruptible. The judges are among the great permanent officials of the state. They enjoy large incomes and great social respect.
>
> "When they traverse the country on their circuits they are received by the High Sheriffs of each county with the ceremonious pomp of the Middle Ages and followed hither and thither by admiring crowds. Even the bar treats them with more respect than is commonly shown by the clergy to the bishops."

While no one desires to overindulge our federal judges, it is unworthy of this republic that while on circuit they have to live in cheap hotels or rooming houses, since neither their salaries nor travel allowance enable them to obtain first-class accommodations, with luxury omitted. The American eagle has to use a chicken coop.

The Duties of a Federal Judge

FEDERAL Judges in New York State are showing a tendency to quit Uncle Sam and accept places upon the state bench, since it is impossible for many of them to live properly in the metropolis upon their pay.

New York pays its so-called Supreme Court judges who correspond to circuit or common pleas judges elsewhere $17,500 in New York City and $14,000 up-state, with a fourteen-year term.

The Cook County or Chicago circuit judges are paid $12,000 and the Vice Chancellors in New Jersey also receive the same. Common Pleas judges in Philadelphia and Pittsburgh are paid $11,000, and $12,000 in Dauphin County, where Commonwealth causes are also tried. In counties from 140,000 to 500,000 population the pay is from $8,000 to $8,500.

Justice Day, of the Supreme Court, who recently died, was the size of man the federal courts need. He was a notable district judge, and also a Spanish War peace commissioner. His father had been chief justice of Ohio and his son had also gone on the bench. However, this son has deemed it expedient to leave the bench to give his family the benefit of the excellent income he at once commanded at the bar.

Our Federal judges have jurisdiction in bankruptcy and this often involves their supervision of the reorganization of railroad systems and great industries where hundreds of millions of dollars are involved. They handle patent causes dealing with the basic features of our industrial system, and also income tax causes of national significance. The public lands and resources are protected by these courts. They try admiralty or maritime causes and also diplomatic and consular questions where momentous decisions as to international relations are made.

The above work is in addition to their criminal jurisdiction where they punish mail and bank robbers, counterfeiters, smugglers, box car thieves, narcotic drug vendors, white slavers, bootleggers and many other offenders.

A federal judge dealing with a great commercial cause can frequently detect long before anyone else opportunities for speculation that would make him or his friends millionaires. While we have never had a Supreme Court justice accused of corruption and but one lower judge impeached, the poorest man in the street will recognize the vital necessity of having none but judges who are at once remarkably keen and able as well as incapable of even considering misuse of their high, but poorly paid office.

The lawyers who try these million-dollar causes before the district federal courts are frequently awarded fees of twenty-five, fifty or one hundred thousand dollars or more by judges who have toiled on the bench and in their chambers for sometimes more than a year, that a proper decision might be reached.

It is not generally known that President Harding encountered all sorts of difficulties in obtaining men to fill the twenty-four new district judgeships created to cope with the volume of new business thrust upon the federal courts. It is said by well-informed men that he was unable to get in every case men who measured up to the past standards.

One could also mention several distinguished federal judges who have resigned and been succeeded by mediocre men. One can't blame the Presidents for these appointments. A great, rich country can't expect brilliant men to undergo mean living to serve it. Of course in remote sections fairly good men welcome the appointments, but in decreasing numbers there.

"Tried Before the Judge"

THE specious argument: "We have always had many candidates for the vacancies," ignores the high traditions and tremendous responsibilities of the posts, some of them want to put on the same patronage level as postmasterships. The life tenure doubtless makes the jobs seem a snug harbor to the political lawyer without a clientele, but from such afflictions, Good Lord, deliver the Nation!

It is especially important that the district federal judges be the finest type of trial magistrates. Very few can afford to appeal causes from the trial court and unless they are handled competently there, wrongs will go unredressed.

The district Federal judges are about the only trial judges in America who really try causes. State constitutions, legislatures and bar associations have made their judges mere *umpires* who try to see that the opposing lawyers observe the rules. His Honor is governed by the maxim "Observe the practice of the oyster and be dumb." In State courts cases are "tried before the judge"; in Federal courts the judges try the case.

The judges, and not the lawyers, rule the Federal courts. Federal courts are not easily "jockied." Very rarely is there even the suspicion of a Federal judge doing "favors" for political or other reasons.

It is common talk in the underworld that a rogue need not waste money upon high-priced, unscrupulous lawyers if he is going to be tried before such Federal judges as Judge Anderson, of Indianapolis, or Judge Killits, of Toledo, or several others.

Men acquainted with our best district federal courts are replete with stories of how their judges have prevented lawyers from fleecing clients or imposing upon the court and jury. Perjury, jury fixing and political influence are all perilous matters in these courts, which is the reason for the unpopularity of these courts with lawyers who have been accustomed to regarding courts as appendages to the practice of law instead of public instruments of Justice.

It is notorious that before Judge Killits had been sent to Fort Worth, the Texas legal machinery had not punished those responsible for the oil stock frauds.

The Attitude af the Alien

ONE of the scandals associated with the misadventures of Governor McCray, of Indiana, was the failure of the state courts to convict him, leaving it to the federal court, as Judge Anderson remarked in passing sentence. The officers of the Dollings companies of Ohio, who sold seventy-five millions of worthless stocks, had to be fittingly punished in the Federal courts. It is but natural that a certain type of lawyer dislikes good federal judges.

The earlier immigration to this country brought people acquainted with the only incorruptible judiciary in the world aside from our own. Not so the bulk of the thirty millions of recent arrivals, most of whom are still unassimilated.

The bench of Spain and Portugal, Italy, Austria, the Balkans and Russia, on the authority of Lord Bryce, has always been more or less open to corruption. This has bred into our latter-day immigration the notion that all judges can be reached. Some elected state and city judges have unfortunately tended to confirm this Old-World viewpoint. *Federal judges say that the most persistent attempts to influence them come from this class.*

The Spanish Mussolini and His Troubles

How General Primo de Rivera Finds His Path Different and More Difficult Than That of His Brother Dictator in Italy

By H. A. STUDDERT KENNEDY

THE way of the dictator is hard. It is so chiefly because there is, for the man who travels that way, no turning back. Unless he is big enough, when the work he has set himself to do has been done, to retire, like Cincinnatus, to his farm, he must go on buttressing up his citadel of power with ever more pronounced acts of autocracy. Moreover, when the first work of joyful pulling down is over, there comes the inevitable demand for a building up. For the first few weeks and months, the people rejoice in the activity and change they see all around them, and are willing to take promissory notes for future reforms and betterment. Later on, they may be willing to renew these notes—more than once. But sooner or later, they grow tired of so much hope deferred; elements of opposition, silenced at first, begin to be heard; and, to change the simile, in spite of all the efforts of the dictator to add to the height and strength of the dam, the water rises steadily behind it.

A Man of Seventy-two Titles

THE trouble with General Primo de Rivera, the Spanish dictator, that patient, painstaking grandee of Spain, the man of seventy-two titles and many more decorations, is that he is not really of the stuff that dictators are made of. True, he is robust and insistent, and accustomed to be obeyed. But he lacks entirely that originality, that personal magnetism, that imperious determination to have his own way in his own way, which caused Mr. Mussolini's meteoric rise to power and enables him to retain that power far beyond the term allotted to him by some of the most astute observers in Europe.

The fact is that the Spanish dictator is an imitation. He makes no effort to conceal it. On the contrary, he rather glories in it. His great hero is Mussolini. And so when, a short time ago, a Portuguese writer, Homen Cristo, wrote a book entitled "Mussolini: The Builder of the Future," he conceived the brilliant idea of inviting General Primo de Rivera to write a preface to it. The general complied with alacrity, and in true Spanish style unfolded his worship. He admires Mussolini as "a master of energy and patriotism," and pays tribute to him as a true democrat. He tells of how, on his recent visit with the king and queen of Spain to Rome, his eyes sought out the eyes of Mussolini on the station platform, and of how, on his departure, he realized that, as far as the Italian dictator and all his greatness were concerned, the half had not been told him. The king of Spain presented General Primo de Rivera to the king of Italy with the words, "Here is my Mussolini!" Did the general resent the suggestion of a second place? Nothing was further from his thought, and his parting from Benito Mussolini was, in his own words, not a mere matter of handshaking, but of heart-to-heart embrace.

Solving the Moroccan Problem

THE Spanish dictator has never been ashamed to have it said that he was something of a copyist. His great trouble is that there is a limit, quickly reached, to the effectiveness of imitative tactics. The Italian people are not the Spanish people, neither are the Italian problems Spanish problems. General Primo de Rivera might establish military control throughout the country, as did Mr. Mussolini, might purge the government offices and government railways of superfluous officials, might insist on work being done for salaries paid, might deal drastically with the Socialists, might muzzle the press—in all these matters Mussolini had shown the way. But when it came to a distinctly Spanish question, such as the solving of the Moroccan problem, for instance, the rock upon which so many Spanish statesmen have come to grief, there was for him no word of helpfulness out of Rome. The greatest of all the problems laid upon him for solution, General Primo de Rivera has to solve alone.

At first, of course, it was all very simple. The solution of the Moroccan problem was to be one of the first acts of the new directory. The Spanish people might depend upon it that it would be done. There would be no more vast expenditures, no more troop trains, no more disasters. The Spanish people joyfully acquiesced. Morocco had been with them so long, and opinion upon it had been so divided, that they welcomed anyone who told them, with an air of confidence, that the problem was about to be solved.

For a time, they really believed that it was being solved. There was no word from Morocco. The scare headlines were conspicuous in the papers by their absence, and at first the readers of these papers did not notice that many other accustomed things were equally conspicuous for the same reason. After a time, however, they began to realize that the Moroccan problem, like many other problems, was being solved by a system of press censorship. Strange rumors of the most disturbing kind began to find currency. Vague stories of disaster in Morocco every now and again filled the air. Then came the foreign newspapers. The suppression of all authentic information had opened the door wide for the exploitation in the foreign press of all manner of exaggerations. And Madrid woke up one morning to find the atmosphere charged with disaster, and men excitedly discussing the stories which had reached the capital through foreign newspapers of nothing less than a debacle at Melilla.

(C) Keystone

King Alfonso of Spain and his self-elected premier, Primo de Rivera, are seen in an amiable discussion on the palace grounds in Madrid. Both men seem to be well satisfied with the way things are running, and we wouldn't be surprised if the king is secretly delighted that he was allowed to keep his head and throne.

Hastily the dictator, realizing his blunder, sought to remedy it. The directory issued a calming statement in regard to Morocco, the long and the short of which was that, while there was no really serious disaster, Morocco was still the same old Morocco, the same old bottomless pit for Spanish treasure and Spanish manhood that it always had been in the corrupt days before the advent of the directory.

A Reversal of Public Sentiment

AND so the Spanish Mussolini, in dealing with the first great problem in the solution of which he could expect no help from Rome, had failed rather ignominiously. Hitherto he had been successful, and nothing had succeeded like success. Now he had failed, and it quickly became apparent that the movement was to be reversed. Those who had suffered most from the rigors of suppression, began to take heart of grace.

Today, this movement is in full swing. There is, for instance, that incorrigible cartoonist, Luis Bagaria, with his uncanny ability always to keep well within the law even of an autocratic directory. Day after day, there appear in *El Sol* the most elusive, yet unmistakable cartoons. Not a word is said of disrespect to the powers that be. Not a single explanation is offered. Every cartoon appears under the protection of that ancient saying, "Where the cap fits, there let it rest."

The trouble is, of course, that, in spite of their early appreciation of the vigor of his methods, the Spanish people are more and more siding with the Luis Bagarias against the dictator. Deprived of so many things, so much wonderful political writing, which previously constituted the sole interest of the Spanish press, they look eagerly forward from day to day to this unequal contest between the rapier-like thrust of Bagaria and the bludgeon defense of De Rivera. Thus, some little while ago, the writer, Don Jacinto Benavente, announced in the course of an article, somewhat sententiously, that the blame always rests with the governed and not with the governing. Immediately Bagaria seized upon the idea, and next morning all Madrid was laughing consumedly, if silently, over the picture of the much enduring Spanish people in the form of a workman questioning Benavente on the matter. "But, Don Jacinto, I don't understand," he remarks wretchedly, "if the people get the government they deserve, what was the use of the revolution?" So, without uttering a word, does Bagaria "speak disrespectfully of dignitaries."

Astute King Alfonso

AND then, of course, there is the king. Again and again in his long reign Alfonso has shown himself endowed with a peculiarly sound political sense. Ministries have come and gone—their memories strew the records of his reign, thick as leaves in Vallombrosa. But the king has advanced literally from strength to strength in favor of his people. He has a way with him, a way of making friends out of enemies and good Royalists out of stout Republicans which has repeatedly upset the calculations of such students of contemporary history as were inclined to leave him out of account. He makes his decisions quickly and acts decisively.

And so when General Primo de Rivera, in the early days of last September, carried out his *coup d'état*, and seized the reins of government, Alfonso hurried to Madrid. And lo, when the king descended from the royal train, he was clad in the uniform of a Spanish general. All the opponents of De Rivera and of the military junta behind him threw up their hands. De Rivera had obviously won. Like his brother in Italy, Alfonso accepted the situation, and hailed his Mussolini because he saw that, for the time being, it was the will of the people.

But Alfonso is keeping a close watch on the will of the people, and the struggle between Bagaria and his Mussolini does not escape him. His ears are quick to hear "the silent applause," and his eyes quick to know the ways of the political winds. And Spain, as it has done so frequently in the past, is beginning to turn to him, to look for him to act in his own peculiar way. How does he really view the somewhat blundering stride with which his Mussolini is marching forward to ever more drastic re-insurances of power? How is he viewing the wholesale silencing of recalcitrant college professors? What does he think of the banishment of Don Miguel Unanumo, the venerable president of Salamanca University, to the Canary Islands, and so on?

His Majesty Signs His Name

WELL, there is a story going the rounds of Madrid today which is here very much to the point. It is to the effect that one day General Primo de Rivera appeared before Alfonso with a lengthy list of people who were under suspicion of not being too well disposed toward the directory. General de Rivera advised their banishment. Would His Majesty look through the list and give him his views on the matter? Well, His Majesty did. After some moments of grim scrutiny—so the story goes—he turned to his Mussolini and remarked calmly, "General, you have omitted one name and I am going to add it." He wrote rapidly and handed the list back to the general. There was a moment's terrible silence, and then a sound of hastily torn paper, and the general, in some confusion, was taking his leave. The story has it that the name which the king had added was—Alfonso.

It is just here, of course, where the Spanish Mussolini has a more difficult task than his Italian brother. Alfonso is a power to be reckoned with, whereas Emmanuel is not, or at any rate he is not a power to anything like the same extent. When Bagaria and Morocco have done their work, the sword of Alfonso thrown into the scale may well turn the balance, and the seat of the Spanish Mussolini may know him again no more.

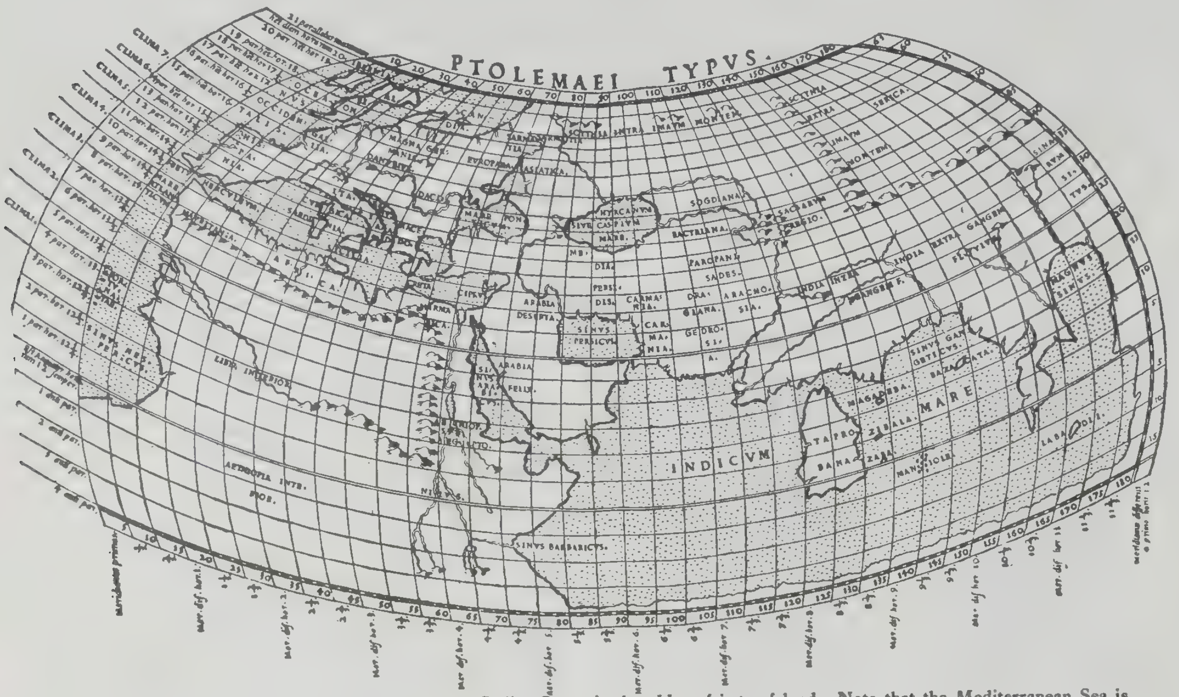
The Evolution of the Map of the World

Errors in Early Maps Lead to the Discovery of America

By LOUIS C. KARPINSKI

THE earth as seen from any high elevation appears to be a flat, circular disk. So we know it to be today and so it seemed to primitive man five thousand years ago. In the earliest representations, the earth appears as such a circular disk and this form continued to appear until about 1000 A. D.

The first known map maker in history is the Greek writer, Anaximander, who lived about five hundred years before the Christian Era. He also introduced the sundial into Greece. Probably Anaximander had his knowledge of both maps and sundials from Babylonia. The map has always been a powerful incentive to discovery, for the unknown places on the maps stand as a constant challenge. And so it was in Greece that exploration and discovery were stimulated by Anaximander's work.



Ptolemy's map of the world, 150 A. D. Note that the Indian Ocean is closed by a fringe of land. Note that the Mediterranean Sea is sixty-five degrees east to west, whereas it really is only forty-two degrees wide.

The colonization efforts of the Greeks and the trading expeditions of the Phoenicians during many centuries before our era greatly increased the knowledge of the world. The most amazing voyage of the early period was made about 500 B. C. by Hanno, a Carthaginian. With sixty vessels carrying 30,000 persons, Hanno sailed from Carthage along the Mediterranean coasts and through the Strait of Gibraltar and southward along the coast of Africa. Here colonies were established.

A century later another Greek, Pytheas of Massilia, again sailed through the "Pillars of Hercules," as the Strait was called, and turned northward to find England. From this time (340 B. C.), England and Ireland appear upon the world map. Phoenician sailors during these centuries were exploring the Indian Ocean and extending the knowledge of the world toward the East.

In Babylon and in Greece other curious individuals began to study the movements of the stars. Who would suspect that to know where you are upon the earth you really must look into the heavens? Such is, in fact, the case, and latitude and longitude upon the earth are determined even today by observations of the heavenly bodies.

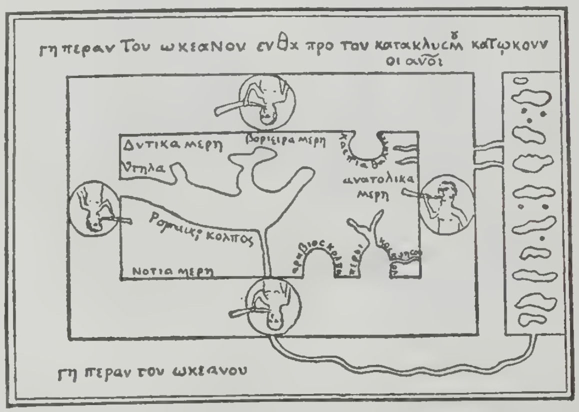
These early astronomers soon arrived at the notion that the earth is a sphere and not flat. By the use of the sundial and by using instruments for measuring angles, quite correct latitudes were early determined. The observation of the North Pole Star gives very easily the latitude of the place of the observer. The first strictly scientific geographer, Eratosthenes, c. 300 B. C., introduced latitudes and longitudes upon the map and also a system of zones. Moreover, Eratosthenes made the first serious attempt to measure the circumference of the earth and arrived at about 28,000 miles instead of 25,000 miles, a remarkably accurate measurement.

Eratosthenes learned that at the time of the summer solstice a deep well in Assouan, in Egypt, was lighted to the bottom of the well. By observing the altitude of the sun at the same time this gave the difference (1/50 of complete circle) in latitude between Alexandria, where Eratosthenes taught, and Assouan.

A thousand years later, or about 800 A. D., a group of Arabic astronomers and geographers made another attempt to measure the circumference by using the flat desert distances, but without attaining greater accuracy. After the French Revolution the ablest French astronomers measured the circumference, the meter being taken as one ten-millionth part of the quadrant of the earth, which is taken as 40,000,000 meters in circumference. However, later work has shown that this measurement was also slightly in error.

The Roman Empire contributed much to a more accurate knowledge of the world. The Romans were enthusiastic builders of paved roads, many of which are in fine condition today. This knowledge of the earth, which these roads and the Roman rule made possible, is reflected in the earliest map of the world which has come down to modern times—Ptolemy's map of the world, made about 150 A. D. This map continued in active use right up to the time of Columbus. Ptolemy's geography became the standard textbook on this subject and after the invention of printing this geography was often reprinted.

Ptolemy's map of the world was a most excellent representation of the discoveries which had been made to his day. The most northerly land is the famous and mythical island of Thule. Farthest to the west are the Fortunate Isles, now known as the Canaries, and from these Ptolemy's longitudes are measured, as this made all longitude of the known world east longitude. Probably the fact that the Mediterranean Sea has its width, the narrow part, running north and south accounts for our word "latitude" when one would naturally expect the word "longitude" to represent the length of the map, up and down. Ptolemy placed north at the top, which was not done by later Arabic geographers.



Sixth century A. D. rectangular map by Kosmos Indikoplenstas. World floating on water.

One fundamental error made by Ptolemy continued to influence later maps until long after the discovery of America and even contributed, probably, to the discovery of America. Ptolemy made the Mediterranean Sea too wide by twenty degrees and made the distance east and west across Europe and Asia together as much as forty degrees too wide. In consequence, since there are only a total of 360 degrees in the sphere, the distance from the Fortunate Isles to Asia was made narrower. Columbus expected to find Asia and even toward his death Columbus labored under the influence of the idea that he had touched a part of Asia. The fact that the distance to Asia appeared shorter than it really was, undoubtedly assisted to encourage Columbus to undertake his memorable voyage.

The second fundamental error made by Ptolemy is the representation of the Indian Ocean as a closed sea, closed both on the east and on the west by a body of land. In this land boundary on the south and on the east Ptolemy's map of the world differs from most maps in the period up to the time of Columbus. On these later maps and on Arabic maps the land surface is represented as floating upon a circular disk of water which entirely surrounds the land. During the Dark Ages and the early Middle Ages up to about 1300 A. D. the maps made in the church schools were quite crude affairs.

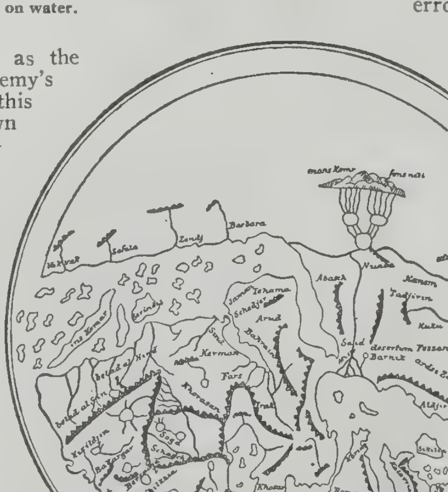
The Arabs were for many centuries the most highly civilized people of the world. In astronomy, in geography and in mathematics the Arabs led the world from about 800 A. D. until 1400 A. D. Arabic travelers covered the whole known world, penetrating to India and to China and returning home to write extended accounts of their travels. However, in the making of maps the Arabs did not display great ability, retaining the circular form and often using geometrical lines instead of true delineations. Nevertheless their accurate accounts of travel were later used by the Europeans who came into contact with the Arabic scientists in Moorish Spain and in the East during the period of the Crusades, 1100 to 1300 A. D. One of these Arabic maps is shown above, wherein the south is placed at the top, as was the Arabic custom. Possibly the Arabs became more diligent students of astronomy and geography because their religion required that in praying they should face toward Mecca. The Arabs invented or revived the use of many fine astronomical and geographical instruments, and Damascus was as famous for such instruments of peace as it was for swords and knives.

The twelfth century was one of great intellectual activity in Europe, as shown by the founding of the universities where thousands of students gathered from all over Europe. This intellectual interest was partly stimulated by the Crusades, which gave thousands of Europeans their first definite notions of other lands; travel was a strong educational force then, as it is today.

The European students came into contact with Arabic learning in Toledo and Seville in Spain and through the Arabs European navigators first learned of the compass, the magnetic needle. This application of the magnetic needle to the compass, probably originally made by the Chinese, exerted a powerful influence upon discovery and upon the making of maps. With the compass it became possible to determine more accurately directions and thus distances upon the maps. At first this discovery influenced more particularly the portulans or sea-charts used by navigators. Upon such maps of the fourteenth and fifteenth centuries are found the most accurate representation of distances on the Mediterranean Sea. These maps do not give latitude and longitude but only radiating lines, "rose of the winds," indicating wind directions.

The terror of the deep, of the uncharted oceans, was largely dispelled by the compass. With its aid long voyages out of sight of land became possible, as direction could be kept in the daylight by the compass as well as by the stars at night.

In the discoveries which followed the appearance of the compass, the Portuguese, the Spanish, the Italians and the Arabs all played important parts. One Portuguese prince, Henry the Navigator, established about 1420 a school of navigators and began systematic exploration of the west coast of Africa. Prince Henry died in 1460 but it was the continued influence of the voyages made under his direction which made it possible for Bartholomew Diaz in 1489 to round the Cape of Good Hope, demonstrating beyond possibility of doubt Ptolemy's error in making the Indian Ocean a closed sea. A little later, but after Columbus, Vasco da Gama completed the long desired passage from Europe to India by the Cape of Good Hope. These African explorations of Prince Henry and the Portuguese played no small part in bringing about conditions which made possible the enterprise of Christopher Columbus.

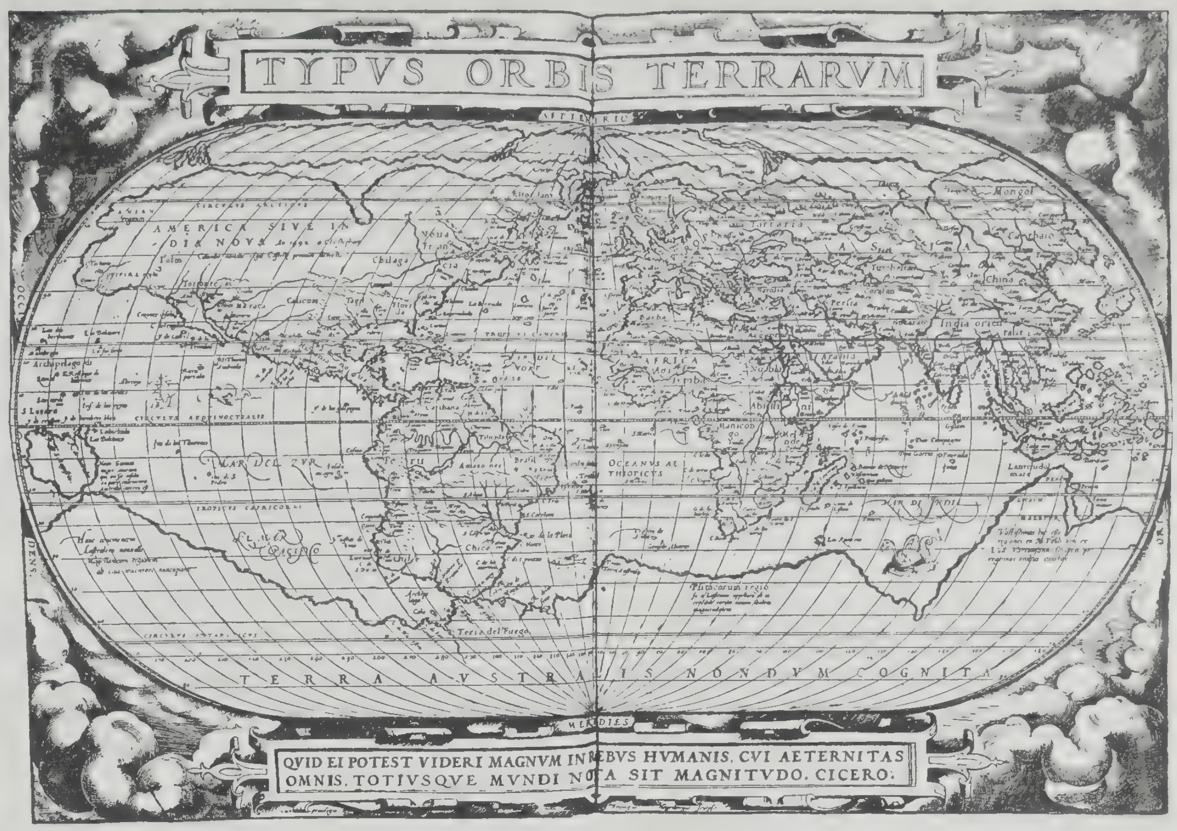


Arabic map of the world, 1154 A. D. South is at the top of the map; the sources of the River Nile are indicated. By turning the map around the outlines of Europe can easily be recognized.

The two geographers whose maps fall in the period immediately preceding Columbus are the Italian Toscanelli and the German Martin Behaim. The globe of the latter was made in the year 1492. On this globe and in the map of Toscanelli the distance from Europe across Asia, from west to east, covers 230 degrees, leaving only 130 degrees or even 125 degrees between Europe and Asia, from east toward the west across the Atlantic Ocean. In this ocean was placed Cypangu or Japan and a more or less mythical island, Antilia. These islands were regarded by Columbus as possible resting places on his projected voyage across the Atlantic.

On the memorable voyage starting August 3, 1492, Columbus had with him a map made by the Italian astronomer, Toscanelli, and undoubtedly also a map made by Columbus himself. It is reported that in the early days of his struggle to achieve recognition Columbus supported himself by making globes and maps. Be that as it may, Columbus in his days of prosperity refers more than once to maps which he himself made. Just before the great voyage Columbus said: "I intend to make a new sailing chart in which shall be depicted the entire sea and lands of the ocean, in their proper places and under their own rhumb. Also, a book containing the same, painted, with the equinoctial latitude and the western longitude." For many years after the invention of printing it was customary to decorate the printed maps with ornamental figures, colored by hand, and the maps themselves were often colored. The older sea-maps are frequently highly illuminated with gold as well as other colors. Bartholomew Columbus was more able in constructing both maps and globes than his brother Christopher, according to contemporary historians, and before 1492 Bartholomew settled in Portugal as a professional cartographer. Unfortunately no map by the great admiral or by his brother Bartholomew has been preserved. However, one map of 1513 has long been known as the admiral's map, because an inscription on the map has been interpreted by some historians to imply that Columbus had a part in the making of the map.

With the discovery of the New World one might expect a veritable revolution in the world map. However, such was not the case. The maps made directly after the discovery commonly represented the region of North America as containing several small islands in the open sea. Other early maps represented North America as an integral part of Asia. The passage from Europe to Asia across a northern waterway long appeared on the maps and for quite as long a period was ardently sought by Europeans, desirous of an easier way to the spices and the silks of the East than the way around Africa. Columbus himself apparently never touched the mainland of North America but only the great continental land of South America.

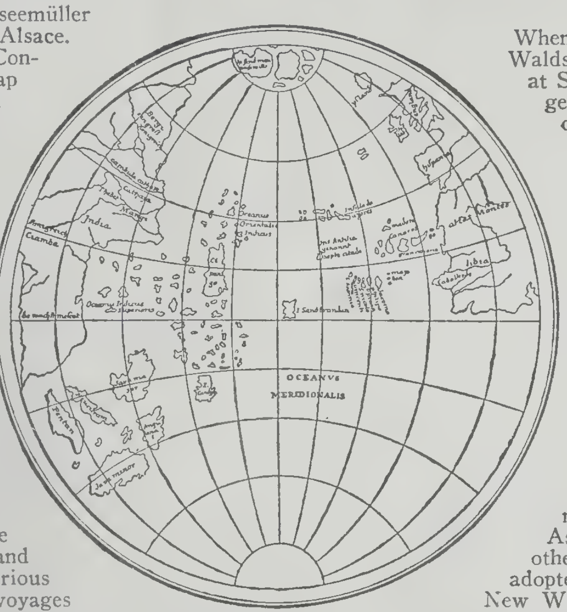


TYPVS ORBIS TERRARVM
QVID EI POTEST VIDERI MAGNVM IN REBVS HVMANIS, CVI AETERNITAS OMNIS, TOTIVSQVE MVNDI NOTA SIT MAGNITVDO. CICERO.
TERRA AVSTRALIS NONDVM COGNITA

Famous Dutch map of the world, by Ortelius, Amsterdam, 1570. The longitudes are still greatly in error. Note the extreme width of Northern North America. A northwest passage is indicated.

The earliest map including the New World was made by a Spanish pilot, Juan de la Cosa, in the year 1500 and is preserved in Spain. The earliest printed map including the New World came to light less than one year ago and was acquired by the British Museum. This map was made by an Italian cosmographer, Giovanni Matteo Contarini, and was printed by a famous Florentine engraver, Roselli. The year of publication, 1506, precedes by one year the first map to contain the name America, that made by Waldseemüller in the village of St. Dié in Alsace. The newly found map by Contarini, the Waldseemüller map which christened America, and the map of 1508 by Ruysch, all represent small islands in place of continental North America and all represent Asia from fifty to seventy or more degrees nearer America than it really is.

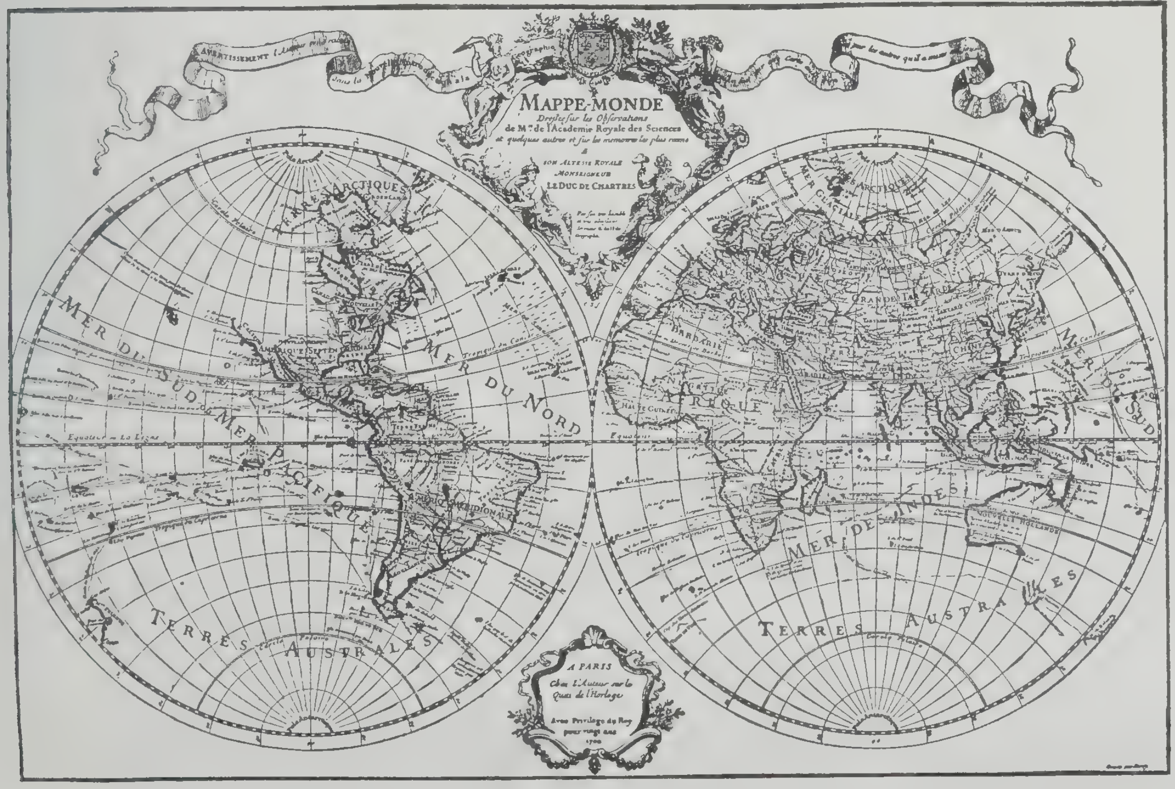
With Columbus is associated the name of that other Italian navigator whose fame was also achieved in the service of Spain, Amerigo Vespucci. His voyages to America are a subject of controversy but in any event his ability as an advertiser is not subject to the slightest dispute. Amerigo's picturesque accounts of the New World read like fiction and scholars disagree in their various estimates of the story of his voyages only as to the amount of fiction contained therein. Certain it is, however, that Vespucci made two voyages to the New World and it is probable that he was on the first Spanish ship to touch the mainland of North America. His fame as a geographer and cartographer in his own day is beyond dispute. From 1508 until his death, on February 22, 1512, Amerigo Vespucci was pilot major of Spain examining and instructing pilots in the use of the quadrant and the astrolabe, the chief nautical instruments of his day. In addition Vespucci was charged with the task of preparing a correct map of the new lands, "to be called the Royal Chart by which all pilots shall direct and govern themselves."



The Martin Behaim globe of 1492, the discovery year. Note that the distance east and west from Spain (Hispania) to Japan (Cypangu) is about eighty-five degrees; it is nearer to 200 degrees in fact.

When in 1507 Professor Martin Waldseemüller of the little college at St. Dié was preparing a small geographical work to include a discussion of the New World, Vespucci's story had made such an impression upon him, that he said, "But now a fourth part (of the world) has been discovered by Americus Vespucius . . . . wherefore I do not see what is to hinder us from calling it Amerige, or America . . . .after its discoverer." More than this, Waldseemüller and his associates prepared maps and globes depicting the New World. Upon these the name America was placed, and this name harmonized so well with Asia, Africa and Europa that other map makers approved and adopted the word America for the New World.

One copy of the first edition of the book which named America has survived and is the proud possession of the New York Public Library. One and only one copy of the 1507 map with the name America upon it has survived and was found in 1901 in the library of Prince Waldburg-Wolfegg in Würtemburg. One and only one copy of the globe made in 1507 to accompany the plane map has been preserved and is found in Vienna in the collection of Prince Liechenstein.



The De L'Iisle map of the world, Paris, 1700. Based upon the observations of several scientific expeditions. The longitudes are approximately correct and make a tremendous advance over preceding maps.

The Spanish and Portuguese navigators continued for some years to devote their energies to the southern hemisphere where there was gold. On Tuesday, September 20, 1519, Magellan sailed away to the west on the first circumnavigation of the globe. On October 21, 1520, Magellan entered the strait which still bears his name, and through this strait his fleet sailed on and on to cross the Pacific. After a series of disasters including the death of Magellan in a battle with the natives of the Philippines, the one surviving ship reached South Africa on May 9, 1522, and passed the Cape of Good Hope about a week later. On the seventh of September, 1522, eighteen of the original crews, totaling nearly three hundred, anchored near the mole of Seville, having completed the voyage which established forever the earth as a sphere. Incidentally these mariners discovered that they had lost a day in their voyage around the world.

The English and the French voyages of discovery followed close upon the Spanish and Portuguese, but their efforts were directed to the northern hemisphere. Long before Columbus it is now known that Scandinavian seamen reached first Labrador and then North America. But so far as any knowledge which was reflected upon maps is concerned, the northeast coast of America became known through the voyages of another Italian, John Cabot (or Caboto), who sailed in the service of Henry VII of England. Whether Cabot reached the St. Lawrence in 1497 is open to question, but quite probably in the second voyage, that of 1498-1499, Cabot sailed along the coast of North America from Florida to Maine. Sebastian Cabot, his son who accompanied him, was a navigator, cosmographer and cartographer. Only one of Cabot's maps made at Paris in 1544 has survived and is preserved in Paris. The important place of maps in discovery is well attested by the fact that Columbus, Vespucci, and the Cabots were all professional cartographers as well as navigators.

The recognition of the continent of North America as such was due in the first place to Verrazzano, yet another son of Italy. His voyage was made in 1524, exactly four hundred years ago, in the service of Francis I, of France. The French continued these explorations with native sons of France. In 1533 Jacques Cartier entered the St. Lawrence, marking the beginning of two hundred years of glorious French activity in the St. Lawrence Basin and the Mississippi Valley.

The discovery of the Pacific Ocean by Balboa on September 25, 1513, marks the beginning of our knowledge of the west coast of North America. Ferdinand Cortez in 1533 discovered the Gulf of California, which appeared as a gulf upon the early maps. However, beginning in 1622 cartographers began to represent California as an island, and so it appeared upon many maps well into the eighteenth century. Alaska and the northwest coast waited for the Englishman, Captain James Cook, and his voyages of discovery in the time of the Revolutionary War. Bering sailed in 1728 through the strait which bears his name. However, long before (1566) map makers separated America from Asia by the "Straits of Anian," but the geographical basis for this is not known. The coast lines of Alaska were not known until after the voyages of James Cook.

During the period of the great discoveries the scientists of the world were actively engaged in producing more refined instruments of observation, astronomical and geographical, and finer instruments for measurement of angles and distances. The problem of accurate determination of longitude, essential for correct maps, was then unsolved and also the correct determination of the circumference of the earth. However, about 1600 the telescope was invented, probably by a Dutchman, and in 1610 Galileo Galilei announced the discovery of the moons of Jupiter. This would appear to have little to do with the earth but the moons of Jupiter have frequent eclipses and these make possible through observation of the difference in time of their occurrence the determination of difference in longitude between the places of observation. Accurate clocks or chronometers are also essential for rapid determination of longitude and these were constructed during the eighteenth century. Mechanics as well as pure scientists had a real part in solving the problems of longitude.

Not until 1700 A. D. was a fairly correct and generally accepted map of the world achieved with the old

(Concluded on page 14)

The Man Who Ate the Popomack—A Review

A Fierce Plot Fiercely Acted; Two Other Productions

By PETER SCHUYLER

IT REMAINED for Manhattan's latest cult of Free Theater experimenters, the Cherry Lane Players, with a sense of humor altogether unexpected in so serious-minded a body, to produce a play written around a stench. Mayhap, with a cynical eye and perhaps at the instigation of adherents to opposing political parties, "The Man Who Ate the Popomack" (pronounced, if you care to know, "pope-o-mack") was staged to prepare Manhattan for the forthcoming Democratic National Convention.

As may be easily deduced, the piece came over here—in the steerage no doubt—from the other side. It was written by an Englishman, W. J. Turner, and enjoyed some measure of success in London, where the fog covers a multitude of things. American drama-making genius has not yet developed to the fine state where it looks to its nose for inspiration; its progress has been arrested, as the experts on mental defectives say, by the infernal triangle and the A. H. Woods bedroom farces. Manhattan is no stranger to theater rancidity. But it has never before had the privilege of witnessing a performance which had to do with human limburger. Thus, in a sense, the Cherry Lane Players have the right to be called unusual and novel. They are Manhattan's freshest Christopher Columbuses. They have discovered a new world in which to disport themselves and entertain their admirers.

The admirers, however, are at a distinct disadvantage. The Cherry Lane Players are hard to find. Taxicab drivers as a rule know all the outlandish places. They may not be able to locate the simplest street address but they are up-to-the-minute when it comes to weird entertainment locations. No bootleg establishment, no matter how carefully disguised, can long escape their eagle eyes, yet Cherry Lane proved a problem to half a dozen postgraduate taxi brigands, to say nothing of a telephone operator, forty-two street gamins, a policeman, and numberless innocent passers-by, who were unavailingly implored for its location.

The taximeter on the cab was just about to give up the ghost in despair when the chauffeur found out that the place he was looking for was in the center of the very block around which he had been cruising for the better part of an hour. Cherry Lane is a euphemism, for it is only a Greenwich Village alley in spite of its rural connotation.

Some time in the dim past, when Manhattan was in its incipient gianthood, there may have been cherry trees in the old-fashioned gardens which fringed the village. The children of those days may have raided the orchards for luscious ox-eyed cherries. All that is over. The only cherries in Greenwich Village now are the aniline-dyed ones in surrepetitious cocktails and the riding, which is not infrequent, is done by husky gentlemen wearing Internal Revenue Service badges.

A Malodorous Story

MARINERS on the bounding main of the Free Theater put into strange ports, and the temples of the new art of the stage have histories as strange as the productions that are given in them. The Provincetown Theater was originally a barn or a garage. The Neighborhood Playhouse, in the vitals of the Grand Street ghetto, is part of a settlement-house project. But the Cherry Lane Players, with the same spirit of novelty which characterizes their present offering, put into the most bizarre harbor of all. What is now the home of "The Man Who Ate the Popomack" was formerly a sawmill. With a good deal of ingenuity it has been made into a playhouse approaching comfort. True, the space between the rows of seats offers no allurement to long-legged persons, and the walls are covered with the usual Greenwich Village wild decoration. But the seats are seats, not penitential benches like those in the Provincetown Playhouse where the new god of the drama, Eugene O'Neill, is worshipped so adoringly. And the stage settings of "The Man Who Ate the Popomack" are very well done. They exhibit none of the "rag and a bone and a hank of hair" artistry of Manhattan's theatrical experiment stations.

The story of the play, which is supposed to be a satire, concerns a youth who is engaged to marry the daughter of an English-Jewish knight. He is egged on—one might say rotten-egged on—by his prospective father-in-law to eat of a Chinese fruit called the popomack which only appears every century or two and looks like an innocent Hubbard squash. Its meat is so entrancing to the palate that, once it is tasted, the eater becomes a popomaniac and cannot rest easy unless he has popomack for breakfast, luncheon, dinner and supper. Surely there is nothing wrong in that.

But the danger lies in the fact that the popomack smells so horribly that it cannot be served in company without endangering the nasal peace and comfort of everyone for miles around. It outbarrens Barren Island. It out-fertilizers the Jersey bone-dust plants. It out-stenches the Grand Central Zone slaughtering house. It is the *ne plus ultra* of malodorousness. But if one can hold the nose long enough to get the first bite he no longer senses the odor. He can eat the popomack without smelling it, though everyone else runs from its presence.

But the popomack is a vengeful fruit. It resents being eaten and it takes out its wrath by transferring its odor to the person who has eaten it. The man who eats the popomack becomes redolent of the sewer.

That is what happened to the Honorable Rupert Clavelly. He bit the popomack and the popomack bit back. The net result was that Rupert's intended bride jilted him, and her parents, all his friends, and the neighbors avoided him like a pest. To get even, he sent a sailor out to round up another popomack and invited his betrothed, her English-Jewish knight father, and the rest of the cast to dinner and served them popomack disguised as crabmeat cocktail, or some such appetizer. Naturally with the Honorable Rupert in the room they could not smell the popomack, so they devoured it. When Rupert told them what he had done they were panic-stricken. His beautiful loved one gave him such a tongue lashing he never got over it. He thought if she became as aromatic as himself everything would be happy and she would marry him anyway. She indignantly declined, doubtless on the theory that one stench in the house was enough.

A Play of All-English Cast

IN ANY event it was only in a dream that all this happened. But when Rupert awoke he ended it all by shooting his brains out in front of a picture that, for some unexplained reason, was the cause of it all.

There is a yarn going about to the effect that two well-known Broadway producers went down to see the play after making a wager as to which of them could stand the odor of the popomack longest. At the end of an hour one theatrical magnate emerged, gasping for breath. Ten minutes later the popomack was seen sneaking out the stage door of the Cherry Lane Playhouse and dashing for the East River garbage dumps.

Quite—and happily—unlike the English importation at Cherry Lane, is the revue which André Charlot, a London producer, has put on at the Selwyn Theater. It is given by an all-English cast, including the chorus, and is an unusually diverting and amusing entertainment. There is no nakedness—at least as Manhattan understands that word—and while in one or two places the comedy is a trifle near the rind it is not done with the brash aggressiveness of our native dirt dispensers. Neither does it characterize any large proportion of the program. It is just the dash of spice—so-called—without which English music hall humor cannot be properly flavored. Most of the laughter, which is spontaneous and wholesome, is created by the burlesques of Beatrice Lille, a low comedy artist who really deserves that description. Miss Lille not only has a sure grasp of grotesque comedy methods but she is never obviously aware of the fact that she is funny. Like a true Briton she has a respect for tradition and at least once indulges in the absolute essential of the English comic's make-up, a luminous, red-nose paint. Her take-off on a British patriotic song, with a marching chorus representing His Majesty's colonies, is uproariously received and her rendition of the song, "There's Life in the Old Girl Yet," halted the stage proceedings. One line of the lyric, wherein she describes herself as "Gladstone's pet" was greeted with a howl of laughter. Gertrude Lawrence, who shares with Miss Lille the feminine position of prominence, is a refreshing treat. She has beauty and delicacy, and a sweet, if slender, voice. She cannot dance—no one in the company can for that matter—but it is a deficiency which is more than made up for by her personal loveliness and her indubitable charm.

The male star of the company when it first opened in Manhattan was Jack Buchanan, probably the most graceful, talented and capable big man the modern musical comedy stage has produced. He has the size and masculine vigor of a champion heavy weight prize-fighter, he is an intelligible and intelligent actor, a fine comedian, yet he dances like a sprite. He was an enormous success in Manhattan but engagements, contracted prior to the coming of the Charlot company to this country, forced him to return to London. His place on the program has been given to Nelson Keys, an actor of established reputation who has an impossible job trying to fill the Buchanan shoes.

The chorus ladies are a startling contrast to our home-grown product. They are a buxom, healthy-looking lot without a trace of "anemia." One of the best offerings on the program is a satirical number, "Incredible Happenings." Unfortunately for its effectiveness, the same idea was used in one of Manhattan's most noisome stenches, "Artists and Models." A note in the program at the Selwyn runs, *"Mr. Charlot produced this sketch in London. Since then it has been staged by American producers without permission of Mr. Charlot."* Up to this writing the Shuberts, who are responsible for "Artists and Models," have not taken Mr. Charlot to court for libel.

In contrast to both these presentations it is pleasant to note that "The Show-Off," a comedy written by a native American about American people and built around a character which is a too common American type, is an unmistakable hit. The author, George Kelly, is a Philadelphian and was for a long time a vaudeville actor and writer. Two seasons ago, a play of his, "The Torchbearers," a biting satire on the little playhouse groups," brought him to the attention of those who study the theater in the hope of finding talent which is real and indigenous. He had no friends among the log rollers who write dramatic criticisms and their astonishment that someone outside their clique had actually written a success was hilarious. This second play of Mr. Kelly's confirms their worst fears. He shows signs of being a real playwright with an uncommon lot of ideas around which to construct his comedies and a sense of cleanly fun which is unique in these times. Under the circumstances it is not peculiar that the critical wiseacres have fallen over their typewriters dishing out extravagant praises on "The Show-Off." Neither is it peculiar that the play, good as it is, is not nearly so clever nor consistent nor worthy as "The Torchbearers."

Aubrey Piper, the show-off, is a clerk in the freight department of the Pennsylvania Railroad, earning the customary salary attached to that job. But if Aubrey is tied to a desk, his imagination is not. That faculty soars like the eagle. To hear him one would come to the immediate and logical conclusion that the president of the Penn system was his office boy. He is a most egregious and conscientious liar, a good deal of a rotter, and a lot of a cheat. But Amy Fisher, who loves him, is blind to all that. Aubrey hypnotizes her by his indestructible imperturbability. Nothing feazes him. Caught in lie after lie he laughs or bluffs his way out. Her mother hates the sight of him, her father agrees with her mother on that point, her brother laughs at him and isn't fooled by his pretensions, and her married sister has penetrated his bluff to its uttermost depths. Still Aubrey goes on his merry way. He talks in millions, he blows his own horn continually and continuously, and he marries Amy.

Bartels' Interpretation of Aubrey

IT ISN'T long before the poor girl discovers that he is a magnificent conversationalist but a poor provider. They get in debt and get out again by going into deeper debt in another flat. Amy still loves him but she begins to analyze his actions more judicially and to the conclusion that she loves him in spite of his faults not because of them. The death of old man Fisher happens luckily for Aubrey as he has about reached the limit with his landlord and he actually manages to get himself and his wife invited home to live. Mrs. Fisher rages and storms but Aubrey, as always, gets his way. Amy's brother, who has weighed Aubrey and found him short-weight, and is an embryo inventor, sells a patent for a huge sum of money. But it is Aubrey, unknown to the young inventor, who has gone to the purchasers of the patent and representing himself as a lawyer, has bluffed them out of twice as much as young Fisher was willing to accept for his device. The final curtain falls with Aubrey declaring himself in as a partner and Mrs. Fisher throwing up her hands in despair at the prospect of having to put up with a son-in-law more obnoxious in success than he ever was in failure.

Fortunately even for the monetary success of the comedy, an unknown actor, Louis John Bartels, was selected to impersonate Aubrey. Mr. Bartels, like Mr. Kelly, had his ability buried for a long time in the grime of contemporary vaudeville. In fact, he played the part in the many-shows-a-day varieties when "The Show-Off" was a one-act sketch. It is due to an undefined quality of attractiveness in Mr. Bartels' faker that it is possible to swallow the last act switch from reality to pathos. The lines and the things Aubrey does make the character completely despicable. But it is impossible to hate Mr. Bartels' Aubrey. Under all the meanness of the character there shines the saving factor of the actor's personality, and instead of an utterly reprehensible blackguard Mr. Aubrey Piper, as lightened by Mr. Bartels is only a pleasant sort of good-humored rogue in whom there is little harm and perhaps a bit of good.

Mr. Ford's Page

WHERE the notion began in American thought that the Government is a great Christmas tree whose function is to shower gifts upon the people, would not be easy to define. But that it is not American in origin, and that it was first adopted by politicians at the behest of alien constituencies, is very clear. The first surrender of our American ideal of self-help in favor of an alien ideal of government aid, was made in the interest of political selfishness of the cheapest kind. That is, a bargain was struck between self-seeking officeholders and self-seeking citizen groups, on this principle—"You help our selfish schemes and we will help yours."

There is all the difference between the practical self-reliance of Benjamin Franklin which laid so well and true the foundations of our active life, and the method of "practical politics" which fosters the idea of government as an inexhaustible fount of unearned favor, as there is between day and night.

There is as much difference between the philosophical self-reliance of Emerson which put iron into American thought, and the flabby popular social philosophy of the time that the government is a great benefactor to be seized and wrung for endless benefits, as there is between the civilization that reared an Emerson and that which reared a Trotsky.

THE bad habit of relying on Government for aid was first fixed among industries and then began among individuals. Yet the best businesses grew without special government aid, and so will the best citizenship. The genius of the American people is Self-Reliance. Diminish that and you diminish their government. The old principles that made us great—self-direction and self-help—are still contemporary and valid. Youth never had so great an opportunity as today. Where there was one opportunity fifty years ago, there are hundreds now. There are a thousand times more per capita opportunity than in colonial times. We have always created more niches than we could fill—that is the genius of our Nation. Never was there less need of Government help, never more doors for self-help, than now.

Not only is the whole movement toward dependence on government basically wrong as to fact, but it also destroys every possibility of the very good it seeks. First, this idea is wrong in fact, because when Government is explored, it is found to have nothing to give except what is given to it. Second, this idea is destructive of the very good it seeks because it shuts off the source of whatever wealth or power the government might have for collective use. When, for example, the government of Russia was seized, what was found? Nothing. The millennium did not come. Instead, disorder entered, and what measure of benefit there was in the old order was dissipated. With all the supposed source of blessing in their hands, the inaugurators of the new system found there were no blessings to dispense, no, not even the common blessing of bread.

The mischief which is done by this alien idea is twofold. It works through political selfishness to deflect government from its legitimate duties. Our legislative channels are choked with proposals to give gratuities in every direction, to organize a paternalism that leaves no corner of life free from the patronage of government agencies, to benefit class as against class, and interest as against interest, without end. Legislators have in large measure begun to think that their function, as members of government, is to serve as nursemaids to the people instead of clearing the field of action that the people may do things for themselves. Lawmaking bodies have an impression that this is the activity which makes them most popular with the masses. They think that in this they truly represent the people's desires. Thus, we see one aspect of the mischief of making Government a glorified grab bag for a Lazarus nation, which waits for the crumbs or cakes of favor to be thrown at them.

The other mischief is that it prevents the Americanization of those vast multitudes who have come hither to seek a new life. Instead of being initiated at once into the true American ideal of self-help, these multitudes are kept in the European attitude of waiting to have things done for them. In exchange for their votes they are offered the various forms of so-called "aid" which but render them habitually dependent and turn their eyes to the government as the source whence comes their help, instead of to themselves, their own energy, and the opportunities which American life has never ceased to offer.

It is well worth our considering that these very multitudes have come hither from lands where paternalism has gone to seed. The best of them came, and are still coming, because, consciously or not, they loathed the incubator type of life to which they were doomed. The British Government is just waking up to the very important fact that the "dole," instead of satisfying the people who form the backbone of the nation, is really disgusting them. They are making their way as fast as possible out of a country where they must subsist on government favors, to enter Canada and the United States where they believe that the spirit of self-help still has an opportunity. And what kind of people are being reared in their places? Largely those who would be contented with the "dole" to the end of time.

The irony of this system is that the government which adopts it, must continue to do more and more; and as the demand for more increases, the ability to do anything decreases. For there is nothing in government that does not come from the people; and a people in whom the spirit of self-help is killed contribute less and less to that which they desire, until in the end both people and government fall into a common helplessness. When Russia performed that amazing right-about-face, and abandoned official communism for a partial return to private enterprise, it simply testified to *the indispensability of self-help to any people.*

We are so enamored of progress in this country that we forget the truth that principles never grow old, that the principles which made us great and strong and fair are just as valid today as they were in colonial times. Principles are not like methods of manufacture and transportation, to be discarded with each generation. The Ten Commandments represent a foundation from which no amount of progress has moved the race away, and the Sermon on the Mount represents a principle along which the race has yet to progress. In attaining the one, we do not discard the other. We need very much these days the plain knowledge that progress is never away from principle, that progress is always *within* principle.

We often say "we must go back to the old principles," and the very expression "go back" grates upon this generation. Its instinct is right in that. For after all, it is not a going back at all, but a switching over.

The principles which made America are not ancient but contemporaneous.

Two parallel roads lead into the future: that of exterior, artificial "aid" which Europe has followed, a road now so boggy that all the nations are wallowing in helplessness; and the road of self-help which America has followed, and from which so many forces now seek to persuade us. This road of ours grows wider, solider, more inviting with the march of history.

In spite of all the noise that is made by the advocates of the other road we have not felt the American road as yet. America is still the sphere of the conquering and upbuilding power of self-direction and self-help.

The only danger is that the youth now coming up may be deluded for a time to think that their future depends on government aid. Their future lies with themselves. Where there was one opening for energy in colonial times, there are hundreds of thousands now, each opening leading to possibilities above the average. There is more opportunity in the country today—let us say a thousand times more *per capita* opportunity—than there was fifty years ago.

Let our young men learn that. Nothing could be more false than that all the niches are filled. The genius of our nation is always to create more niches than we could ever fill, and even the millions of immigrants that have come have not been sufficient to fill them. And still the creation goes on. No one can fill one's niche but oneself. He finds it and succeeds in it by the courageous spirit of self-reliance and the achieving spirit of self-help.

A volume of 452 pages, durably bound, containing 98 of these articles, under the title of "Ford Ideals," will be sent postpaid for $1.00.

What Muscle Shoals Really Means

THE Muscle Shoals controversy means more than water-power and fertilizer, more than the opening of the South's new era; it means that two Systems of Business are colliding head on! The contest is Production *versus* Profits. Service and Spoils confront each other.

If nothing else comes of this controversy, this at least has been achieved—the system of exploitation has been drawn out from its cover into public view. All its American and foreign tentacles have been disclosed. Its pressure methods have been studied in all sections of the country and in all lines of business. For the first time in our economic history the interests which commonly sharpen their teeth on each other have ceased their private fights and have joined in single pack for a combined terrific assault on one lone offer for Muscle Shoals. Never before has such concentrated opposition been piled up against a single object.

Is it because the interests themselves want Muscle Shoals so badly? No. When the war stopped and the Government found unfinished Muscle Shoals on its hands, the Government sent out men and messages to these very interests asking bids for the completion and operation of the works. One after another all possible users of Muscle Shoals were approached. And with one accord they declared that Muscle Shoals wasn't worth a nickel, that as for themselves they would never invest a penny in it.

Whether this was a concerted movement to destroy any idea that Muscle Shoals had value, is not for us to say. Whether its purpose was to enable some member of the trust to get it for nothing, is not here alleged. But the fact is that the interests when approached joined with one voice in depreciating the value of this Government property.

By some chance, and last of all, Henry Ford was proposed as a possible user, and the Government requested him to examine the proposition. In response, he made the first and only businesslike offer the Government has received, an offer backed by millions of his own funds, an offer involving the completion of the great works to high productive capacity, an offer involving a limited income fixed by law, and, last of all, an offer involving the return of the entire developed property to the government at the expiration of the contract period, or at any time it might be needed for war purposes.

What this meant, although it cannot all be stated in the cold language of contracts, is that a demonstration was to be made of how cheaply power could be produced for employment and productive purposes. The ratio developed by the Ford Motor Company is one workman per horsepower—a job for every unit of power developed. If a million horsepower is developed at the Shoals, it means a million jobs. It meant also the liberation of the farmer from the present heavy burdens of the fertilizer trust. More than that, it meant a great source of munitions, a military resource *American controlled* and of the first importance.

This is the proposition which the concentrated forces of the exploiting interests are opposing. This is the offer which many newspapers and magazines are now attacking *after having endorsed it.* The pressure came late upon the newspapers; apparently it was applied in other quarters first; but within three months there have been concerted and wholesale desertions of their former position by the press.

Why? Is there a better or more promising offer in sight? No. With the Ford offer refused, there will never be any other offer heard of. Why, then? Is it personal opposition to Mr. Henry Ford? As to that, strangely enough, the real opposition is not against Mr. Ford personally. It is against his system of service in business. If he were less likely to make Muscle Shoals a demonstration of how cheaply the necessaries of life could be made, there would be less opposition to his offer. The great fear is that he will actually accomplish what his offer proposes!

If Henry Ford had agreed to do business along the old lines, charging the power-users all the traffic would bear, charging farmers all they could pay, squeezing out every cent of personal profits that could be had—if he had agreed to do business along the lines his opponents follow, boosting prices and profits, *Muscle Shoals would have been handed to him long ago, with the blessing of every exploiter in the land.* But the power trust knew that he would demonstrate that power costs little to produce and less to transmit. The fertilizer trust knew that he would demonstrate what a wholesale system of robbery has been practiced against the American farmer. In fact, the Ford system of doing business would be the Judgment Day for the Old System, and the Old System has gathered itself in bristling alliance to save its life.

This is the meaning of the opposition. Two opposed systems are colliding head on.

What temporarily becomes of Muscle Shoals may be a secondary matter. But the Ford offer has already done this for the nation: It has given millions of dollars of value to a property that the interests said "wasn't worth a nickel." It has given the System of Selfishness in business its death warning. That system knows it too. No other meaning can be attached to this unparalleled concentration of hostility to the only offer which the government has thought it worth while to consider.

The Ten Elders of Gotham

RECENTLY unveiled in the Hall of Fame at New York University, the busts of ten persons were set forth as the metropolis' ideals of ability and Americanism. They were all persons of the old stock. Even in New York, it seems, no other selection could be made. Three of the immortals are natives of the state of New York, three of Massachusetts, two of Southern states, and two of the West.

Statesmanship is represented by John Adams (Massachusetts), Andrew Jackson (Carolina, but whether North or South is in dispute; he was born on the border), and Thomas Jefferson (Virginia), Adams the diplomat; Jefferson the philosopher of democracy; Jackson the practitioner of democracy, and glorious fighter for it.

Religion is represented by Phillips Brooks (Massachusetts), the famous preacher of Trinity Episcopal Church, Boston; greater in his character than in his intellect, yet towering high in both.

Science is accounted for in three men who were more useful than they were famous. James Buchanan Eads (born in Indiana) is scarcely a notable name today, yet he was one of the first great engineers in America, supplying the United States Government with a fleet of iron-clads for the Mississippi in 100 days, and spanning that river with an arch bridge. Joseph Henry (born in New York State) was the inventor of the electro-magnet, a contribution so notable in its time that it led him to posts of responsibility at Princeton and in the Smithsonian Institution. William Thomas Green Morton (dentist, born in Massachusetts) was honored as the discoverer of what is now called ether, and its use in surgical operations. The discovery of anesthetic seems to have been made at about the same time by at least one other than Dr. Morton: Dr. Jackson, perhaps, had the priority in time; but Morton's application of anesthetics to surgery is beyond question, and for this New York honored him. Thus in Science were engineering and medicine (or chemistry) recognized.

Literature—Mark Twain (Missouri) whose universal tribute is a reminiscent smile.

Commerce—Peter Cooper (New York) coachmaker, ironmonger, first metal fireproofer, patron of telegraphs and canals, and, in Cooper Union, patron of public intelligence.

And last of all, impossible of classification, because so rich and various, Alice Freeman Palmer (New York). To describe her as an educator were to exalt but one part of a service so rich and a personality so enduring, that analysis loses its keenness in admiration. So in Mrs. Palmer it shall be said that New York paid tribute to *Womanhood.*

In this selection the real New York is seen.

The Bonus

THE President's veto of the bonus bill has been overruled, but his arguments have not.

Although the bonus bill is now a law, the bonus itself will prove disappointing to those who receive it (and who in the end will have to pay for it) while it will exactly double the war debt that now rests on every family in the United States. The estimated cost of two and a quarter billions of dollars does not include the millions which will be required to administer the new law, nor the other millions which will be required to pay interest on the money that will have to be borrowed to fulfil the terms of the law.

Altogether the bonus controversy has been an unlovely one. There was every urge of duty resting upon the Nation to bind up the wounds and make good the disabilities incurred through the war. Nor was it unforeseen that the Government would owe it to every soldier to give him every protection that human wisdom could afford. This latter was done before a soldier had left home shores for overseas. As the President pointed out in his veto message, a greater sum than that involved in the new bonus law is now outstanding in government war risk life insurance, and $500,000,000 has already been paid in cash under these forms of Government insurance policies. This was the manner in which the Government undertook to provide for the pension problem beforehand—the most enlightened and generous plan adopted by any nation. This provision has been practically lost sight of in discussion of the new proposal.

What's done, in this case, is not done. The doing of it stretches through the two decades next ensuing, which will be a most precarious period for all the nations of the world. There are twenty years for this matter to weigh upon the national finances, at a heavy annual rate. The Nation will go through with it, of course, but at the cost of retarding or leaving undone many things now necessary to do if national energies are to be liberated to meet the heavy demands that are coming upon all peoples. In which release of energies the younger men—the ex-service men, of course—would benefit most.

No one begrudges the soldiers the very, very little each of them will get out of it. Indeed, that is the most pitiable aspect of the whole business—such heavy national drain for so little proportionate benefit. The tragedy of all such action is that the reputed beneficiaries are never the chief beneficiaries at all. But this is a generation in which the fallacy has become ingrained that the Government can do anything in a money way. The truth that those who take out of the Government with one hand must put back into the Government with the other hand, or both they and the Government will fall into the ditch, has not yet been written on the national mind. Combined with the debts incurred by state bonuses, the interest that will have to be paid on the total bonus borrowings of our people will be double that of the principal paid to the soldiers. And the three million young soldiers will be the longest bearers of this unnecessary burden.

Incidentally, the prestige of Congress as the business administrator of the people, suffers another blow. Whatever was right to be done in this matter has been done in the wrong way. Whatever is wrong has been done in a most harmful way. The result is going to be dissatisfaction and still heavier demands from the very men whom Congress thought to please and completely satisfy. The way now stands open for the next Congress to go a little further.

The whole issue is a clash between two true principles whose relation to each other has not yet been determined. As the President says, the whole theory of paying citizens to defend their country is untenable. Defense is a duty inseparable from citizenship. Mercenary troops can be hired, but not citizens. That is absolutely true principle. On the other hand, the nation thus defended is so deeply obligated by the service of defense that it cannot rest as if nothing had occurred. It must do something. But to hand out a $50 bonus, or the like, is too much like tipping a waiter. It is absolutely true principle that such service cannot be paid for. And yet as far as material succor is needed to equalize the personal losses caused by war, it is clearly the nation's duty to provide it. But in a great national way, not in a hand-out.

The bonus controversy shows how far both sides fell below the plane of principle. It is one of the most vivid triumphs of the materialistic spirit since the war. And it is not the fault of the ex-service men. It is the fault of the leadership and general citizenship of the country.

Advertising Traps for the Unwary Investor

How the "Belgian Hare" Swindle and Other "Buy-Back" Schemes Are Aimed at Fleecing Farming Communities

By CHARLES ALBERT COLLMAN

IT IS now more than ten years ago that a man, who since has had many imitators, developed a subtle scheme. It may have been suggested to him by the comic story of "Pigs is Pigs." Its momentary lure lay in an appeal to the imagination. He offered to sell anybody a pair of Belgian hares, and since these bred very rapidly, and would be of value as food or for the production of fur, he pledged himself to buy all the offspring raised by the purchasers of the original pair at liberal prices. In other words, you bought from him a pair of blooded hares for $22, and then sold back to him, during the course of a year or so, twenty-one pairs of their progeny, for which he paid you from $7 to $25 a pair, according to their pedigree or condition.

This scheme became known as the "Belgian Hare" swindle, although hares were rarely shipped, the animals sent being often ordinary rabbits. The Post Office Department has for years tried to stamp out this imposture. The United States Department of Agriculture, in Farmers' Bulletin No. 1090, warned rabbit breeders against these so-called "buy-back" concerns. Some of the exponents of this scheme have been prosecuted, fined or sent to prison. But it has been elaborated upon, and today even the United States Government finds it a matter of great difficulty in stopping the fraud and punishing its perpetrators.

The reason for this is that in New York legal circles there has developed a class of men who make a business of instructing their clients how to evade the law. A noted United States Postal Inspector, who has spent years in running down such frauds, told me the other day that the swindlers, when driven into a corner, resort to such law firms, which tell them: *"Keep on doing business. Leave the rest to us. We'll fix it so you won't have to pay back the money."*

How Business Is Carried On

AT FIRST glance it would seem that the Belgian hare scheme could make easy money for everybody. But that is pure illusion. It has never been done. Advertising expenses and the costs of shipping the live animals over many hundreds of miles would inevitably eat up all the profits. Besides, the men who work this game do not intend to buy back the offspring of the animals they sell. Sometimes they accept the money and even neglect to send the "hares." Complaints are merely turned over to their lawyers, who take care of their clients as they promised.

It is remarkable, however, that journals and magazines of wide circulation, possessed of expert advertising managers, and which boast of the volume and integrity of their advertising, are willing to print the advertisements which defraud their own readers. This practice might be condoned if the fraud had not been so widely exposed over a long term of years. The swindle could not be worked were it not for these publications. As it is, groups of men are still engaged in fleecing farming communities throughout the length and breadth of the United States and Canada with "advertising traps" of this character.

Readers may perhaps be familiar with the advertisement shown on this page, taken from the columns of the *Red Book Magazine,* of Chicago.

The so-called Standard Food and Fur Association, Inc., which is no association at all, was originated in New York City in 1919, by a certain Nathan D. Hecht (his name is Yiddish for "Pike," a predatory fish). Hecht had only adopted the plans of a George C. Booth, who had operated a similar business under the title of the United Food and Fur Association. Booth was later put out of business through a prosecution for fraudulent use of the mails. Hecht operated the scheme until 1922, when the game began to get too hot for him, and he sold out to a group of other men.

The person answering the above advertisement received a booklet entitled "Dollars in Hares." It professed to describe the phenomenal profits that could be made by raising rabbits, and confided to the reader that the Standard Food and Fur Association, Inc., considered itself to be "the world's distributor of domestic hares." It offered to buy all the purchaser of an initial pair could raise at from $7 to $25 a pair, and asserted that it was possible for a "good doe to raise forty-two young, or twenty-one pairs in a year," adding, however, that this feat could be accomplished only by an experienced breeder.

More Than 1,300 Per Cent Profit Promised

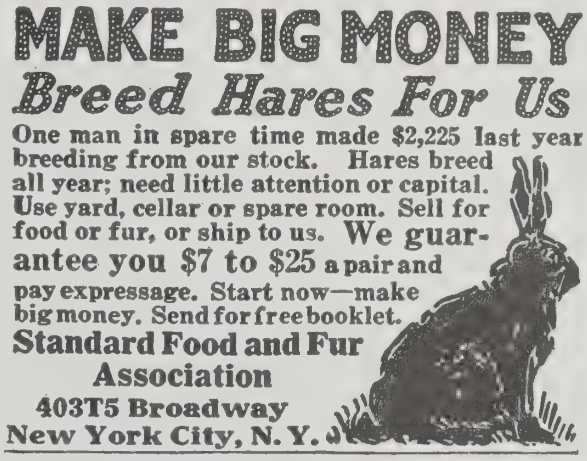
HOWEVER, according to the booklet, it would be not at all difficult for an ordinary person to raise four litters of six each in a year, making twenty-four youngsters, or twelve pairs. At $25 a pair, the gross income from a good doe breeding at this rate would be $300. According to its "buy-back" agreement, the concern guaranteed to pay the express charges. In its contract it stated that it obligated itself to buy back the rabbits "when six to eight months old, according to breed purchased from us, and to be in good health, smooth-coated and in good condition." How these stipulations were used as loopholes for evasion will be seen later.

The "association," however, stated that it was a simple contract, with no requirements that could not be met easily, adding: "We live up to the contract in every respect. We must because we are an old established concern, financially responsible, and can only remain in business by treating our customers fairly."

The persons who began to do business with the Standard Food and Fur Association soon discovered to their cost that the ideal theory, as outlined, of selling back rabbits raised from an original pair, did not work out in actuality. The tricksters had arranged beforehand an elaborate system of evading obligations. When a breeder attempted to ship back the rabbits he had raised, the concern's officials instructed him to prepay the express charges, promising to refund the cost of shipment. Later, for a variety of reasons, the Standard Food and Fur Association refused to reimburse the shipper.

In many instances the concern refused to live up to its guaranty to buy back the rabbits, alleging that the animals were under weight, or that they were dirty, or were not of the original stock that had been sold.

Complaints soon began to pour in, not only to the periodicals that had printed the advertisements, but to the Post Office Department. Postal inspectors were set to work, and they soon accumulated enough evidence against the concern to fill several huge volumes. Lawyers for the Belgian hare people professed that their clients were trying to live up to their obligations, that shipments were unavoidably delayed, that stock had been lost in transit through the negligence of express companies, and that checks had been lost in the mails. All this, according to the inspectors, appeared merely a subterfuge to gain time, and meanwhile, thanks to numerous advertising running at high cost in the magazines, the concern was doing a rushing business.



MAKE BIG MONEY

Breed Hares For Us

One man in spare time made $2,225 last year breeding from our stock. Hares breed all year; need little attention or capital. Use yard, cellar or spare room. Sell for food or fur, or ship to us. We guarantee you $7 to $25 a pair and pay expressage. Start now—make big money. Send for free booklet.

Standard Food and Fur Association
403T5 Broadway
New York City, N. Y.

The type of advertisement which appeals to the imagination and promises easy money.

Complaints Roll In

BUT protests against the company's methods soon assumed the force of an avalanche. One man from Arkansas wrote that he had paid the company $22 for a pair of rabbits after he had read their advertisement, and after the officers of the association had written continuously, even urging him to borrow money with which to get them. In his complaint he says: "On December 23, I wrote to them that I had four pairs of rabbits to ship, all of the same litter, and to please send me shipping instructions. I waited almost two weeks and got no reply. So I wrote again, and after waiting two weeks longer without result, I thought it strange—they had always before been so prompt in answering me. I was determined to get a reply, so I sent a registered letter and got an answer almost immediately. They told me to ship my rabbits and pay expressage, as they had no funds at the shipping point to pay the costs, and as I had the contract, I supposed, of course, that they would refund the money.

"I shipped them in two lots. The first lot consisted of two (2) does and two (2) bucks. They said they had received all O. K., and that I was to send my contract back and get a renewal before I could get my check. I had a true copy of the contract made and then sent the original to them and kept the copy. *In answer they told me I had shipped Flemish Giants instead of Black Siberians and that they were under weight.* Now I have proof that I have never had or owned another kind of hare except the ones purchased from the company, and their young, so if I shipped them Flemish Giants, they misrepresented them to me as Black Siberians."

Another complainant from Canada wrote: "In the *Country Gentleman* there appeared an advertisement before the New Year from the Standard Food and Fur Association, Inc., 409 Broadway, New York City, entitled 'Money in Hares,' so I answered the advertisement, and finally sent an order for $62.10. After receiving it, an order card was forwarded to me stating that the stock would follow as quickly as possible. So I waited patiently thirty-six days and receiving no letter or stock, I wrote them again, and by return mail they said, in substance, that it would pay me to wait until they filled this order, but if not, that is if I could not wait, they would return me the money; so I wrote them to return the money and I would order later in the summer. I have not had a letter since from them of any kind. Are they a reputable concern, or am I stung?"

A man from Pennsylvania sent in $92 to prepay an order, and his complaint continues: "After waiting five months for delivery, on September 17, I submitted a letter to the Standard Food and Fur Association, cancelling the order. On September 25 I received a crate in which were three rabbits shipped via the American Express Company, the express bill on the end of the crate being dated September 20—please note that five days were taken to express live stock two hundred miles—and was marked 'Four (4) live rabbits.' On September 26, I received a letter written under the date of September 24, from the Standard Food and Fur Association, advising me 'that we have this day forwarded you an exceptionally fine consignment of Imported Spotted Giants, and so forth." On September 27, I received from the same concern a letter stating: 'We have this day forwarded you three does and one buck of French Argent de Champagne via the American Railway Express Company. Both letters were signed by the secretary, but his signature was undecipherable, so that his name remains a mystery."

Rural Paper Exposes Graft

NOTABLE among the farming publications that have exposed the Belgian hare swindle is the *Rural New Yorker,* which has been in existence for close onto a quarter of a century. The *Rural New Yorker* refused the advertising in 1919, and from the first denounced the scheme as a fake and a fraud. "There is no such 'association,'" it warned its readers. "This is only a trade name assumed by Mr. Hecht, who also trades under the name of the Big Four Syndicate. We regard this plan of selling pet stock on a contract of this kind, providing to 'buy back' the surplus stock as an undesirable one from any point of view, except that of Mr. Hecht. These dealers do not expect to buy back any considerable portion of the offspring of the stock which they sell. The Department of Agriculture Bulletin expresses our sentiments regarding these schemes exactly. Two individuals working this scheme have been prosecuted by the Federal authorities. One of them went to jail and the other got off with a fine. We have many complaints from those having dealings with this concern. We can get no satisfaction for country people from the Standard Food and Fur Association. Of late our letters are turned over to a firm of attorneys for reply. The concern sends out more checks (according to their own claims) that are never received than any other concern on record!" This publication is unsparing in its denunciation of farm papers that ran advertisements of the Belgian hare fraud "and are now screeching at the shackled thieves, with a part of the plunder in their own pockets."

Obstructing Justice

SO EXTENSIVE had been the advertising, and the complaints of defrauded persons had come from such widely distant parts of the country, that great difficulty was experienced in completing the case against the backers of the scheme. Much evidence was obtained from express companies upon whom the culprits tried to throw the blame when they failed to deliver their animals to those who had bought them. Finally Assistant United States Attorney Charles J. Marasco laid the matter before a Federal Grand Jury, which returned indictments for using the mails in a scheme to defraud against Nathan D. Hecht, James Vavaro, Vincent Lumia, Thomas Vavaro and Thomas Laines. The five men were arrested and held under rather heavy bail, but they took their arrests with much unconcern, and showed very little apprehension about the outcome of the case. They were evidently banking upon the assurances of their counsel and the necessary delays which would ensue before they could be brought to trial. One of the men, Hecht, engaged a former Assistant United States Attorney to take charge of his defense.

Owing to the conditions indicated in the beginning of this article, it has become increasingly difficult to convict men engaged in fraudulent pursuits in New York City. If sufficient adjournments and postponements can be arranged by influential counsel, many such men altogether escape punishment for their misdeeds. In this instance considerable delay has already occurred in the prosecution of these men through the resignation from the District Attorney's Office of Mr. Marasco, who originally handled the case. It has now been transferred to the hands of Assistant United States Attorney D. J. Gillette, who has assured me that the case is actually awaiting trial.

Calvin Coolidge, Our Plain American President

A New Focus on the Background of a Press-Shy Executive

By A. R. PINCI

> CALVIN COOLIDGE is a very plain American, distinguishable for being the best type of Caucasian autochthon, running true to form through the intervening three centuries. Engrave his features on a woodcut of the John Winthrop vintage and you have a perfect likeness of a Shawmut citizen just as, depicted in the latest formal garb, you have in him an easily recognizable type of the self-centered, studious gentleman of New or Old England.

AS WAS to be expected, the advent of Calvin Coolidge to the Presidency of the United States at a time when the country had seemingly forgotten him at once led to the universal American query: Who and what is Coolidge?

Is there a stranger in our midst? Is Calvin Coolidge the "mystery" the country has taken for granted, or has his very Yankee plainness mystified against the background of an extravagant era?

Millions of words in biographical form have been turned out lately, with the result that while a great deal has been written about him, the real Coolidge is quite unknown. Too many "biographers" discovered him *after* he became President, as was the case with Woodrow Wilson.

For the first time since 1857 (Arthur being considered a New Yorker) New England has a President of its own, flesh of its flesh, bone of its bone. New England's neglect as a source of Presidential timber has not been so conspicuous nationally because that territory has been otherwise ably represented in Washington; so much so that other parts of the country frequently chafed under what they termed New England's legislative dominance. By having a President of its own once more, especially at a time when a rough-riding West was grooming spokesmen of its own, is a political advantage which New England does not purpose to relinquish without a struggle. Moreover, New England's representation at Washington now consists chiefly of elder statesmen, whose glory must sooner or later fall upon younger shoulders.

Reserve, Not Self-Effacement

AND now it is time to introduce Calvin Coolidge himself, the portrait being a soft-focus one obtained as the result of personal acquaintanceship with him from the time he was governor of Massachusetts.

Ladies and gentlemen, girls and boys, Calvin Coolidge is a mystery because he is not a mystery!

He is the sort of mystery of which national politics has too few, and the second prominent one to appear on our Presidential horizon within a few years, the other having been Woodrow Wilson. This similarity, which ought to go a long way toward a better understanding of President Coolidge, is not without a source of danger which deserves to be isolated, identified and labeled.

It is the danger of "being interpreted."

Many of us now realize what disastrous consequences being "interpreted" by unauthorized, immature, selfish and gratuitous interpreters brought upon Woodrow Wilson. It would indeed be a pity if an identical performance were undertaken with President Coolidge as its object.

Being the target of so much unofficious interpretation and the object of so much unilateral inspiration is, to a man of his nature, who is not easily irritated or fascinated, unpleasant, and all the more apt to defeat its purpose. I believe I have heard at first hand every shade of appraisal of Calvin Coolidge, as of Woodrow Wilson, and nearly all of it was, or is, worthless.

Of late one has heard much that Calvin Coolidge is self-effacing. Many like him for that who would dislike him if he possessed a more embattled ego. However, too much credibility has attached to this self-effacing quality. It exists, but with a distinction. It is the Yankee way to be self-effacing, if uncommunicativeness, reserve, steadfastness, conservatism, steadiness and self-reliance mean self-effacement, but it is not the Yankee way to be self-obliterating. It would not be surprising if most of those who bank upon Coolidge's self-effacement are not mistaking it for self-obliteration. The most difficult thing, the most futile thing, for one who has known him a bit, is to imagine Calvin Coolidge obliterating himself. Very likely he could not do it; he would not know how. Even his phlegmatic father, a faithful disciple of unobtrusiveness, would protest.

While relegated to that peculiar political and official obscurity which goes with the vice-presidency, Mr. Coolidge was not seriously considered as "good copy." He was waited on by the few major writers who dropped in to pay their respects and keep alive acquaintanceship; the rank and file of Capitol correspondents and reporters looked him up as routine necessity. Unlike his predecessor, Thomas R. Marshall, who managed to rise above engulfing neglect with occasional epigrammatic witticisms, sometimes satirical at the expense of the august membership of the Senate, the bas-relief press attention paid to Calvin Coolidge was due, more than anything else, to his biweekly visits to attend Cabinet meetings, for whom a place had been especially provided by President Harding.

Under the circumstances it is difficult to understand how word suddenly went out of Washington that Coolidge "is good copy." This presupposes sudden conversion, as it were. But it is apologetic. The fact of the matter is that Coolidge was good copy, as is nearly every American citizen in high public office, but no one bothered to regard him as such. Even the "law-and-order" message of 1919 gave him but meteoric fame, from the standpoint of good copy. Now, on the other hand, he is good copy by necessity, which accounts for the alibis.

Calvin Coolidge is press-shy.

Press-shyness does not, contrary to general belief, prevent publicity. Frequently it distorts the object of it. As far as the President of the United States is concerned, prolificness pounces upon the occult environment that surrounds it. Things will be printed about the President anyhow, even if they have to write about his cat, his shoe laces and his bed hour.

Thus one of the dangers that "Be-Brief" Coolidge faces is that of being not understood, as two or three of his predecessors have been, officially, politically, and otherwise. Those few who come in contact with Presidents, in the making rather than after, usually discover some elusive or unknown quality, idiosyncrasy, trait, whim, predilection, symbol or weakness which under certain conditions can be more eloquent about the President than tomes of official speeches and reams of routine explanations. It is the word painting in comparison to the snapshot—and famous men are always remembered through or from their paintings and not their snapshots—while the frame is as important as the picture.

By now the country realizes that Calvin Coolidge philosophizes even in his state papers. Rarely does he make a drastic declaration. He is very careful. The keynote of his sayings is that he wishes to be understood without explaining too much. When definitiveness lacks it is because he cannot say more; he leaves unfinished what is obviously unfinished in his own mind.

He does not prose or battologize. A word from him goes a long way. But because it is one word it does not mean that he is taciturn or supercilious. He finds one word ample, and so far as he is concerned it must do the work that another man does in ten or a hundred. Yet he is gracious and not forgetful, even though he seldom takes the initiative. Once his heart or his door is open to one he deems it unnecessary to renew invitations.

On the other hand, he is even stricter than was Woodrow Wilson with respect to the possible needless capitalization of the "President's acquaintance," or some such relationship. Here is an example, which bears reproducing because its motif has not been discovered by the press.

Three days after he became President, Calvin Coolidge wrote a little letter to James Lucey, cobbler and long-time friend at Northampton, where C. C. laid the foundations of the career which led to the White House.

"Not often do I see you or write to you, but if it were not for you I should not be here, and I want to tell you how much I love you. Do not work too hard. Try to enjoy yourself in your well-deserved leisure of age." Then the superscription: "To James Lucey, Northampton, Mass.—Jim Lucey, who would rather be called a good shoemaker than the President's cobbler, friend and philosopher."

That is a simple letter with a pregnant postscript. It fails to carry an open-arm invitation because welcome is implied; at the same time it has the earmarks of a hint.

Calvin Coolidge is a very plain American, distinguishable for being the best type of Caucasian autochthon, running true to form through the intervening three centuries. Engrave his features on a woodcut of the John Winthrop vintage and you have a perfect likeness of a Shawmut citizen, just as, depicted in the latest formal garb, you have in him an easily recognizable type of the self-centered studious gentlemen of New or Old England.

Always Concentrating

YOU meet his like, therefore, in everyday life. He is not the man you take to on first acquaintance for the common purpose of passing the time, but sitting beside you in the commuter's car you would not hesitate an instant to engage him in conversation—serious conversation, that is—from crops to babies, from labor to government, with the assurance that his are willing ears. If, to illustrate your point, a "that reminds me" story could be intelligently and wittily applied, he would not frown away a smile.

His features are so immobile sometimes as to impart to them a forbidding aura, but this is not intentional. It is the index, most likely, to his self-centered habit. He is always concentrating. But his good humor is unmistakable, or, rather, his capacity for it. It may be difficult to get him to expose it on first acquaintance; after that it is easy sailing, always, be it understood, for a good cause. He lacks that expansiveness that is boisterous, that extra measure of chumminess which men of another type exude so freely. In other words, quantity lacks; quality is as good.

So much so that the Vice-Presidency, which is an ornamental job, which alone would be enough to transmute a fastidious man into an imperious one, socially speaking, never affected those native characteristics which, in the capital's near-heraldic environment, might be banned by the latest book on etiquette. For Calvin Coolidge is, and remains, Calvin Coolidge, first and last.

A few weeks before he became President, I was entering the New Willard Hotel, where he resided and where I stopped, almost at his heels. Mr. Coolidge went ahead, and pushed the swinging door; Edward T. Clark, his private secretary, followed, and I was about to do the same thing when the door jerked and then was swung on its axis so fast that Mr. Clark was obliged to make the round trip while I remained outside.

Vice-President Coolidge emerged.

"Someone has dropped a fortune in pearls," he said to me, "if they are real. But I don't suppose they are or they wouldn't have been left here."

Half a hundred or so loose pearls were strewn on the pavement, between the crevices of a rubber mat, no doubt units from a broken string abandoned by some woman in the tea-drinking crowd below. But nevertheless he picked up one, looked at it, passed it to Mr. Clark, and then went his way.

I can imagine Calvin Coolidge having done the same thing thousands of times in his younger days, picking up a pretty stone, examining a new insect, stooping for any of a score of reasons which curiosity prompts or interest induces. I know, however, of many an official, not even famous or noted, who would have thought of picking up an imitation pearl at so public a place as he would have thought of cutting off his nose, but Calvin Coolidge's doctrine is not that kind. Curiosity is a human attribute; why shouldn't a Vice-President, or a President, be curious?

In fact, he has taken this spirit of naturalness into the Presidency. Returning from a walk taken a lovely May afternoon, he conceived the idea of sitting out on the north portico, where he remained until eating time—"supper," he calls it, Yankee fashion, and not "dinner," Washington fashion. The north portico is practically a public walk, even though few use it at twilight, but to him the porch of 1600 Pennsylvania Avenue is no different from the front porches of Plymouth or Northampton. Other Presidents have communed with nature and history from the recess of the south portico, sequestered from plebeian gaze, but Calvin Coolidge amazed White House attachés by living an hour on the live side of the house.

"Do the Day's Work"

THERE is nothing humble about him, either. He is only intensely modest, and this modesty is often mistaken for humbleness. All of his humbleness is between himself and his God, after which he stands pat, for no man can make him bend. His modesty makes him very circumspect, and often it will cause him to yield or compromise where nothing else could. For it should be said that, among many public men, humbleness makes for pride, whereas modesty never does, a distinction with a difference.

If it were true that Mr. Coolidge is cold and ascetic he would have given proof of it long since. He is neither. There is a decided spiritual or psychic resemblance between Coolidge and Wilson. A phrenologist might discover a finer degree of resemblance. Party politics twained them, of course, but in the fundamentals of government they were almost at one. If Wilson had been president of Amherst College, or if Coolidge were a graduate of Princeton University, they would have remained indivisible.

Coolidge mirrors several Wilsonian characteristics. He lacks Wilson's idealism, however, and in its place is encompassed that homely philosophy, and capacity for philosophizing, so individualistically Lincolnian. There is a general misconception that idealism and philosophy mean spinelessness, if not actually pusillanimity, but two of the most pacific Presidents we have had were more aggressive fighters than many a field general. If occasion warrants, Calvin Coolidge will demonstrate to whomsoever it concerns that he can and will fight, too.

President Coolidge is not athletically inclined. The nearest to it is a hippic habit of old Plymouth and Northampton days—the use of Shanks' mare. He likes to walk. He inaugurated his first mornings in Washington as President by sunrise jaunts. He likes this sort of leg work. It has given him the best experience on how to stand on his own feet.

Nor is that all. It is said that Amherst College will not graduate a man unable to swim more than two hundred yards. At some time in life, once or many times, men are on the water or in hot water, which is not the same thing, and knowing how to swim is essential to self-preservation. There is no deeper or hotter water than the Presidency, so watch Coolidge swim.

I believe that if before executive office hours he could matutinally doctor a tree or remove a stump or harness a pair of horses or rake a ton of hay or make a runway, he would be very happy. Overalls—I am not sure of a pipe, but I am of a thin, long, elephantine cigar—and the necessary tools, and you have Calvin Coolidge ready for any job, from the strictly amateurish to the very threshold of finished trades-union work. The simile is all the more applicable because of the manner in which he was sworn in as President of the United States, in a typical New England farmhouse, by the light of a kerosene lamp, at 2:43 o'clock in the morning, that is, very nearly the rising hour of many country folk.

As the days will pass it will be found that President Coolidge's policy will be consistent with his homely, simple and modest doctrine: "Do the day's work."

Four words, those, which certainly beat the traditional three in making the world go round—and make it better.

Calvin Coolidge, in conclusion, is the foe of staginess, ostentatiousness, extravagance. If his example is worth anything to the nation, we are in for an era of the simple life—much simpler than that preached by Theodore Roosevelt. Let's not forget that although he was Vice-President, fate found him, when about to elevate him, back in his paternal home engaged in primitive labors doing his ancient "day's work."

No wonder he was lost sight of, no wonder he was not good copy! His name was little known to society editors, which nowadays make Washingtonians "famous."

Not even the village paper had made much of the fact that Cal Coolidge, late of here, now of Washington, D. C., "is spending a few days with his father and will be in our midst during the hay season."

Monument to Judge John Rowan.

"The Old Kentucky Home"

Federal Hill—Background of Famous Song

By BENJAMIN OGDEN WILKINS

OF ALL the songs that have been written and sung in this country, surely none has ever been more popular year after year or sung less impartially or with more feeling at gatherings of Americans in all states of the Union, than "My Old Kentucky Home."

While Pittsburgh claims the honor of being the home of the poet and song writer, Stephen Collins Foster, there is a little spot named Federal Hill, near Bardstown, Kentucky, which is memorialized through his famous verses, and which served several generations ago as the inspiration for the refrain which still throbs with life.

A thoughtful man, and full of sympathy for all those about him, Foster sat on the front steps of the old house one evening and heard the Negro slaves singing in a group as they swung down the road, returning from the fields at dusk. Words for a song came to him. They echoed through his thoughts—"Weep no more, my ladies—for we'll sing one song of my old Kentucky home." They were written down, combined with more lines to include several stanzas, and the completed poem with its melody has since become familiar to millions.

It is truly said that Kentuckians, no matter in what part of the world they happen to be, and no matter what differences of opinion separate them, may be brought together, hats off, eyes dim and hands outstretched, if someone starts singing "My Old Kentucky Home." All else melts with the melody of this song, except the feeling that they are brothers—from Kentucky. And it is a fact that Americans generally, without regard to the spot they hail from or the place where they happen to be at the moment, feel the glow of fellowship and are brought closer together at the sound of this song. This old song of home and the Southland is probably the best known of all our songs the country over.

The building of the homestead at Federal Hill was begun at the very end of the eighteenth century by Judge John Rowan, United States Senator from Kentucky and one of the great lawyers of the early western period. He lived in it until his death fifty years later. On July fourth last, nearly a century having elapsed since the old judge's death, the estate was sold by a descendant, Mrs. Madge Rowan Frost, to be held in the custodianship of the state of Kentucky. It is forever to be a shrine representing Home—the American Home—a definite spot which home-builders may look upon and think of all that particular house has meant in the past and still stands for in the hearts of Americans.

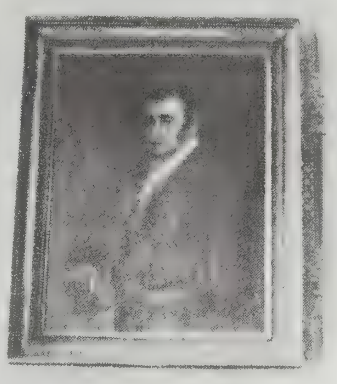
In 1852, Foster, a nephew of the old judge, was a guest at Federal Hill. During this visit, the song was composed. It was sung for the first time in the reception room at the left of the main entrance to the building. Over the mantel in that room now hangs a portrait of the poet, copied from an original which is in Pittsburgh, Pennsylvania. The house and grounds of Federal Hill are full of reminders of the most stirring times in all American history. Statesmen met here to discuss and decide on what the policy of the nation was to be at some of the most critical periods in its development. In the large dining-room at the right of the entrance-way are six gold goblets and a great gold tankard, used by the hospitable judge when entertaining Henry Clay and others. Ambassadors and many celebrated foreigners, including a French prince, made the Rowan home their mecca when visiting America.

The French prince was young Louis Philip, who taught school in Bardstown during the winter of 1796-97, and who frequently visited the Rowan household. Upon his return to France, he sent three pieces of handsomely worked furniture to his esteemed American host.

General Lafayette, too, visited the old judge for three days in 1825. He expressed his appreciation of the hospitality by sending back a French set of twelve chairs and a massive table. These still occupy the dining-room in the old house, and it is a man's job to lift one corner of the largest piece even half an inch above the floor, though it still rolls easily on its venerable casters as lightly as a modern baby carriage.

At the back of the house, near the rear porch, stands an old Chinese ailanthus, or "heaven tree." Its age is a matter of doubt, but the species has the odd knack of allowing its boughs to break off and drop to the ground when they become too heavy. However, these cast-off limbs do not wither and die like those of the ordinary tree would do. Instead, they take root and thrive, spreading out their own foliage and increasing the shade beneath the group. Though maintaining independent growth indefinitely, they never lose the appearance of branches, and do not grow upright like the limb of the parent tree. Instead, they retain their horizontal position on the ground, while the leafing end curves gradually upward from the soil. This tree and its peculiarities add to the fascination of the estate as a whole, but it will have to be cut down, for it has another habit that is not good for the old homestead. The roots, thrust in the crevices of all masonry within hundreds of feet of its trunk, are damaging the foundations of the buildings which it can reach.

Just beside the old heaven tree runs a walk which leads to the burying-ground of the Rowan family. In this little cemetery there are the remains of many kin who died abroad at different times while traveling—brought back from Europe and even more distant points. Resting with their own people at the far end of the old walk, these Rowans lie in the shadow of their own trees, where their own folks may reach their graves and keep them covered with flowers which abound about the old homestead.



Above, right—Portrait of Judge John Rowan, who built "The Old Kentucky Home," and who lived there, as did his descendants for several generations. The Judge was a contemporary and warm friend of Henry Clay. Below—Front of "The Old Kentucky Home," Federal Hill, Bardstown, Kentucky.

The times of old Judge John Rowan and his son were the times of duelling. Neither was of a quarrelsome disposition, and only on the greatest provocation could they be drawn into a personal argument leading to the use of deadly weapons. This fact may seem still stranger when it is realized that both the father and son were expert shots, and to meet them on "the field of honor" was considered certain death for the adversary.

Nevertheless, the founder of the estate at Federal Hill was drawn into four arguments of the kind then thought not to be settled except by duelling; and each time his opponent fell mortally wounded.

The fourth and last duel of the old judge was the only one in which he did not kill his opponent at the first shot. In this one, he was so reluctant to take his adversary's life that he shot over the man's head after the other had missed his mark. Then John Rowan asked if satisfaction had not been secured so that they might renew a friendly acquaintanceship. The opponent refused, though Rowan assured him that the next shot would kill. A few minutes later the judge watched the seconds carry his challenger dead from the field.

The founder of "The Old Kentucky Home" disliked the principle of settling arguments by bloodshed so heartily, that he wrote as follows in his will:

"My duelling pistols to my son John during his life, and at his death to his oldest son—they are never to be used, by either, but when their honor imperiously demands it, and in that case I know they will be held steadily."

Oddly enough, the son John was drawn into four duels, as his father had been. Three of his opponents he killed, but the fourth and last battle is to be remembered best because of the fact that the man opposing a Rowan left the field alive.

When young John, only a few days before his wedding, learned he had made an enemy of a man who demanded satisfaction with pistols, he went to see if he could not explain matters—even to apologize for a fancied wrong if he found that such was at the bottom of the grievance. But the enemy was not to be placated and a challenge followed.

Young Rowan warned the opponent that if a duel were insisted on the man who faced him would meet death. Then he reminded the headstrong enemy of the three men who had been killed in his three duels. But the fight was insisted on, and the judge saw no way to withdraw with honor, and so accepted.

On the evening before the meeting was to take place, the young woman who was betrothed to the head of the Rowan house heard of the approaching fight. She sent word that if he killed his challenger she would not marry him. The predicament was more grave in those days than we can now imagine. Rowan spent a thoughtful night, and, upon meeting his adversary in the morning, announced to him that a mortal wound would not be inflicted—but that the aggressor would be maimed for life. True to the prediction, with expert marksmanship, the man was shot through the hip, his thigh so shattered as to leave him extremely lame during the rest of his days.

And yet that is not quite the end of the story of the fourth and last duel in which the second John Rowan of Federal Hill took part. Years after, while the two men happened to be traveling on the same Kentucky river steamboat, the lame man fell overboard into the swift current. Though the ship's rail was lined with men going down the river on business, and many saw the accident, none was so quick to jump into the water as Rowan. When the drowning man had been brought back to the boat and revived, he looked into the face of his rescuer and announced to the passengers gathered about that this was the second time the judge had saved his life. Expressing his gratitude, he told them about the duel of years before.

But the fascinating history of "The Old Kentucky Home," its people, and its associations might be continued, like the Arabian Nights, through a thousand and one stories—and then its wealth of interest would not be exhausted. Colonel Ben La Bree, himself a prominent Kentuckian, and who has much to recommend him as a man of distinction, has been given permanent charge of the estate as curator since its acquisition by the state of Kentucky. Colonel La Bree knows much of the lore associated with the homestead. His intimate knowledge of the times when this country was young and the part the venerable house and its occupants played in the nation's building and maintenance through various periods of stress, proves his right to be known as a historian—particularly of the period during the War Between the States.

But, though there is much of absorbing interest concerning the house on Federal Hill, it is most unlikely that it would now be set aside as the objective for a nation's pilgrims—except for the fact that a humble man, a poet, a verse writer, a strummer on twanging strings, Stephen Collins Foster, there visited his uncle, and there wrote an enduring song—"My Old Kentucky Home."

Federal Hill, as seen from Bardstown, Kentucky. The Rowan homestead ("The Old Kentucky Home") nestles behind the trees seen in the left background.

The Lure of Flying Throughout the Centuries

Darius Greens of Old Met Opposition and Courted Death

By WILLIAM KNIGHT

TO FLY has always been the fondest dream of the human mind. We consider ourselves today as the inventors of the flying machine and we probably are the first men who have actually and definitely conquered the domain of the air. However, we cannot be so sure about that, because as far back as 400 B. C. a contemporary of Plato, Archita of Taranto, to whom is attributed the invention of the pulley, the screw and the kite, invented and built a mechanical bird that could fly. In most ancient history, in religions, legends and in ancient sculptures, we find the expression of the same nostalgic desire of man to rise above the earth, and one of the highest accomplishments attributed to divinity and to legendary heroes of the past was their ability to fly. An old tradition existing in the Caroline Islands, and not an isolated one by any means, mentions the feat of Oulefat the son of a celestial spirit who built a fire and "with the help of a large bag held upon this fire and filled up with smoke" was able to leave the ground and join his father. Up to the time of Greece we find the gods of ancient history represented as winged men and animals. The Oriental races, especially, were very much taken with this symbolism and we still find in the Oriental decorative art monstrous winged beings reminiscent of their oldest legends. The Greeks, who had a finer sense of proportion and a keen appreciation for esthetic beauty, could not conceive and reproduce the flying monstrosities symbolized by Oriental artists, but nevertheless they clung to the idea of flight and we find in the Greek art the flying horses of Athens and Hermes and the foot-winged Mercury. Later on, the same symbolism was perpetrated by the Hebrews and the Christians, up to the present time when we have transformed the myth into science and the symbol into a reality.

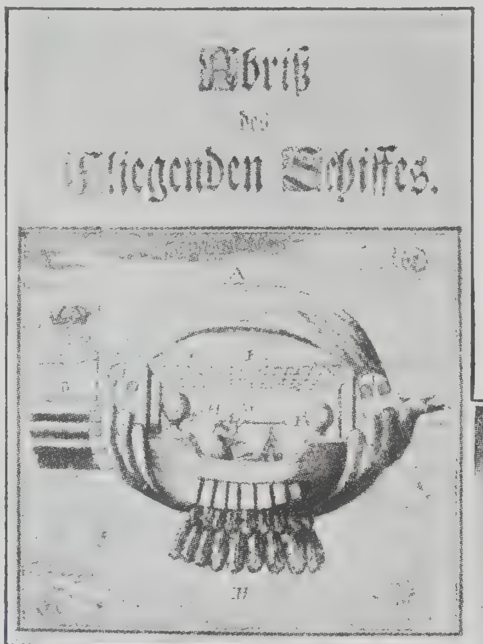
Aristophanes, the great Greek comedian, 400 B. C., in two comedies in which he satirizes Socrates, "The Clouds" and "The Birds," ridicules the attempts made by his contemporaries to fly. Aristotle and Plato in the third and fourth centuries B. C., respectively, mention flying as a practical possibility and furthermore, in his book on the "History of Flight of Animals," Aristotle explains the interaction of the wings and tails of birds and in this respect he can be considered as the great-grandfather of the mechanics of flight. Later on, 55 A. D., the satirist, Juvenal, and the historian, Eusebius, 265-340, A. D., both mentioned in their works a man named Teodato Eretico who crashed to the ground while flying (see Third Satire, Juvenal, and Eusebius' "Ecclesiastic History" Vol. 5, Chapter 12).

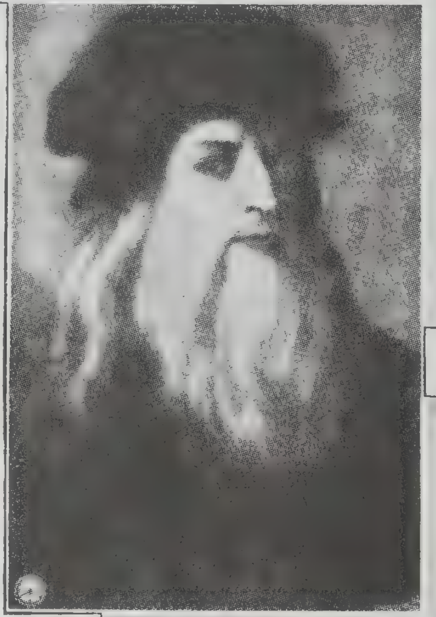
Pliny the elder, 70 A. D. and Gallienus, a Roman Emperor, 260 A. D., have both contributed very interesting studies on flight, especially Gallienus, who first noticed that a surface displaced through the air at a certain angle gives rise to a force opposite to the gravitational force that he calls "psychic tension," can be considered with Aristotle as one of the foreseers of the mechanical laws of flight.

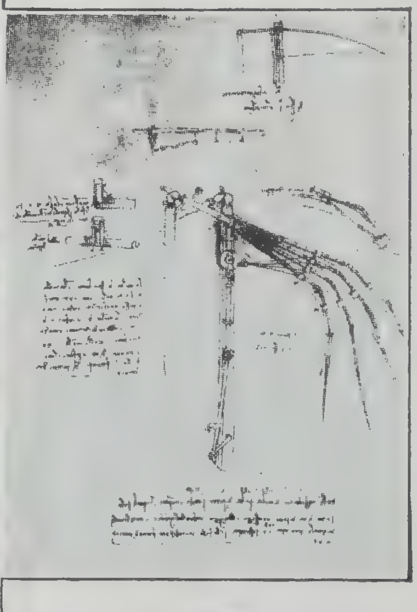
All through the first one thousand years of the Christian Era in the works of poets, scientists and philosophers and in the writings of ecclesiastic historians such as St. Ambrose, St. Maximus of Turin and Teodorito, Archbishop of Ciro, we find flying mentioned as either a possibility or as an accomplished fact. We have no proof, however, that the flights mentioned by ancient writers were really accomplished, and furthermore it is not mentioned by them how this was done. It is only at the beginning of the second thousand years of the Christian Era that we begin to have more accurate details of the feats of the early conquerors of the air.

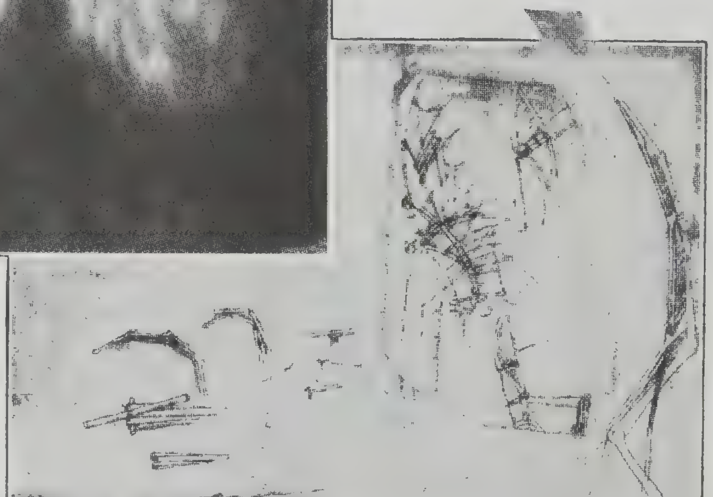
We hear of an Oliver Malmesbury in England, who in the year 1050 attached a pair of wings to his arms and legs, threw himself from a tower and after gliding over a length of 400 feet, fell down and broke his legs. He is probably the first man glider in history. The second attempt at gliding was made by an Italian named Danti, a native of Perugia who, in 1499 on the occasion of the festivities attending the marriage of the ruler of that city, flew from a tower of the Baglioni Castle over the main square of that city. From the description of that flight which is given by Alessi, the historian of Perugia in his book, "Perugia Augusta," we learn that he accomplished a successful glide over a length of seven hundred feet, when the left wing of his glider broke down and he crashed to the roof of a house. Later he made several other experimental flights over the river Trasimeno, but Alessi states, "he could never learn how to land at a safe speed."

A mathematician, Professor J. Muller, a Bavarian, one of the collaborators to the astronomic reform upon which the Gregorian calendar is now based, was another early contributor to the progress of flight. Two models of flying machines built by him in 1460 are worthy of mention. One is a mechanical fly and the other a mechanical eagle. The eagle was moved by an internal clock-mechanism and a test of this model was made in the presence of Emperor Frederick, when it flew two thousand five hundred feet on a straight line. It is not stated in the chronicles of that time whether the flight of this mechanical bird was accomplished with fixed or flopping wings. However, in a book written by Degen, an Austrian watchmaker (Vienna, 1816), Professor Muller's mechanical eagle is mentioned again and the statement is made that it flew attached to a string like a kite.









Above, left—Reproduction of a print published in Vienna, 1709, on the occasion of the first dirigible flight attempted by B. L. de Gusmao. Above, center—Leonardo da Vinci, 1460. Above, right and below—Drawings by Leonardo da Vinci.

Of all forerunners of the art of flying, the one who had a clearer vision than anyone else of the airplane of present days is Leonardo da Vinci. This exceptional man, who was a genius in various fields of arts and sciences, made a study of the flight of birds with a view of establishing the relation existing between the various positions taken by the bird in the air and the corresponding displacements of the center of pressure with relation to the center of gravity. He really established the fundamental mechanical principles of lateral and longitudinal stability of aircraft and when we compare the calculations made by him in 1500, which are collected in the Ambrosian Library in Milan, with the complete theory on the stability of aircraft evolved only a few years ago, we find that he had a clearer conception of the mechanics of aviation than many pilots and aircraft manufacturers of the present day. Besides being the first designer of an airplane (and we find a few very interesting sketches of airplane wings and other parts in his manuscripts) he has been the first man to conceive the idea of a helicopter. As he saw it, the helicopter in order to rise from the ground vertically must be subject to an initial movement of rotation on the ground around a vertical axis and he designed for this purpose a gigantic vertical shaft carrying on its surface some sort of rudimentary screw thread and acting like a screw which was intended to impress upon the helicopter a rotary motion around the axis of the vertical shaft and a linear upward motion in a vertical direction.

About two hundred years later another gigantic step in aeronautics was made by a Jesuit named Lana, a native of the city of Brescia in Italy. A distinguished physicist, Lana was also an inventor and an educator. Credit is due him for the first microscopes used and the elements of an educational method for teaching the blind, the dumb and the deaf how to write. We find in an interesting book by Lana himself, "Podromo," a description of a dirigible which is probably the first attempt made to solve the problem of aerial navigation by the lighter-than-air method. The remarkable part about this project is that the principle upon which it is based is the same upon which is based the latest type of dirigible that has been so far designed—the Garuffo type, which consists of a metallic bag the buoyancy of which is controlled by a more or less perfect vacuum produced inside it by extracting the air therefrom. Lana's dirigible consisted of four spheres rigidly connected together. Each sphere is fourteen feet in diameter and is made of copper foil of such a thickness as to weigh three ounces a square foot. After extracting the air from the spheres, Lana claimed that the spheres would rise in the air, due to the fact that the weight of the air thus extracted would exceed the weight of the spheres themselves. The combined buoyancy of the four spheres, it was anticipated by the inventor, would be sufficient to supply the necessary lifting power to carry up in the air one or more men, depending upon the dimensions of the spheres. The propulsion in any direction was to be effected with sails similar to those in a sailing vessel.

More than three hundred years ago Lana wrote: "No city will be safe in the future against attacks from the air. A machine of this type can destroy fortresses, cities and sailing vessels with explosives and incendiary bombs and can do this without running any danger of being attacked from the ground at the great altitudes from which it can operate." Lana could never build his dirigible on account of the veto imposed by the Inquisition Tribunal, which would not allow such a construction; furthermore they put him on trial for black magic and he barely escaped death. One hundred and fifty years later, in 1848, three French scientists, Marey, Monge and Dupuis Delcourt, took up the experiments on spheres suggested by Lana in 1700, but the results obtained were not satisfactory and therefore were abandoned.

The first aeronautical patent was issued by King John V of Portugal to a Brazilian surgeon named Gusmao, and it was dated April 19, 1709. Gusmao's invention and how he succeeded in making a successful flight in his machine in the presence of the king and court of Portugal has always remained a deep mystery. Here again we find that the all-powerful Inquisitional Tribunal put the inventor in jail in spite of the protection of the king enjoyed by him, destroyed the machine and burned the manuscripts in which the details of the invention were given. From the accounts of the only flight made by Gusmao it seems that his machine was the first balloon ever built and probably hydrogen was used for the first time. At any rate, it is certain that he was able to control the descent of his machine at will and succeeded in making a perfect landing on a predetermined spot. Many writers of that time believed that the flight made by Gusmao was due to sorcery and the unfortunate inventor had to leave the country and hide for the rest of his life in Spain.

Up to the middle of the eighteenth century, aeronautics has been more or less in the formative stage and the many attempts made to produce flying machines were not followed by sustained efforts for solving the many problems involved in construction and operation. Newton made a study of the resistance of the air. Rousseau, Buffon, Wilson, Franklin and a score of other scientists and writers prepared the ground for the Montgolfier brothers to build the first balloon of which we have complete records. On June 5, 1783, the first free flight of the Montgolfier balloon was made and a few days later another record was established when the first parachute jump was made by one of the Montgolfier brothers.

The same year that the Montgolfier balloon made its appearance, a plan for a two hundred and eighty thousand cubic feet dirigible operated by a motor was presented by Lieutenant Mesnier of the French Army to the French Academy of Sciences. This dirigible was never built because of the expense. The first scientific project for a dirigible and the theory on the stability of dirigibles and elongated form of the gas bag is due to Mesnier. He was also first to introduce the air ballonets and the aerial propeller.

From this point on we find aeronautics progressing by leaps and bounds, and today most of the problems that for centuries have attracted the attention of scientists and inventors have been solved.

British Monied Man Attacks Money Monopoly

Arthur Kitson Wages a Life-Long Fight for Currency Reform

By JOHN BASIL BARNHILL

THE moneyless condition of money reformers is a cynical and somewhat overworked pleasantry. It has been alleged that the only person who ever devised a feasible plan for discharging the national debt had less than a twenty-five cent piece himself.

An exception to the penniless status of the average money theorist is found in the case of Hon. Arthur Kitson, inventor, manufacturer, and economist of London. Kitson's singleness of purpose and rare devotion to "The Great Idea—the progress and freedom of the race"—are attested by the fact that he refused a Knighthood which was offered to him in 1910. Like Gladstone he declined differentiation with the rank and file of common humanity.

Born in England, April 6, 1862, after graduating at King's College, London, he was offered, in his twentieth year, a position by the Russian Director of Railways but declined the offer and sailed for America. He spent some months at Haverford College, Pennsylvania, as professor of mathematics and science and then went to the Baldwin Locomotive Works where he studied the construction and running of locomotives for two years. In 1890 he founded and became general manager of the Kitson Hydro-Carbon Lighting Company which exploited his own inventions in gas lighting. According to the Encyclopedia Britannica the first successful incandescent oil lamp was constructed by Mr. Kitson in 1885. It is estimated that there are upwards of six million Kitson lamps in use at the present time. Proof of their efficiency is shown by the fact that the Kitson system was adopted by the Trinity House authorities for British lighthouses; the lighthouse keepers of Great Britain call the Kitson lamp the "Mariners' Friend."

Confronted with the tragic problem of involuntary idleness as brought home to the American people in the Panic of 1893, Mr. Kitson's keen mind saw that "if society does not solve the unemployed problem, the unemployed will dis-solve society." Mr. Kitson approached this problem in the spirit of John Morley who said, "The spectacle of a man who wants work and is unable to get it is a greater tragedy than any Hamlet, than any Oedipus."

On returning to England in 1900 he continued the same work, always as an unsalaried and uncompensated prophet, sacrificing upwards of sixty thousand dollars in the work of educating the public. His activities culminated in 1908 in the organization of the Banking and Currency Reform League and the starting of the magazine, the *Open Review,* the mission of which was to prove that the British banking and currency system was the main cause of the industrial and social ills of the past century.

It is the proud boast of the people of Great Britain that they have a country where, "girt by friend or foe, a man may speak the thing he will." Accepting this as no platonic platitude but the living spirit of the nation, Mr. Kitson employed sandwich-men to parade Threadneedle and Lombard streets, where the great London banks are situated, carrying their banners even to the doors of the Bank of England, advertising the *Open Review* in which the bank's monopoly was denounced and its abolition demanded.

Editors Coerced by Bankers

THE war brought the currency question to the front and Mr. Kitson, in the columns of the London *Times* and *Land and Water* had an opportunity to address the nation on this momentous question. He foresaw and deprecated the deflation policy adopted by the Coalition government at the close of the war. But the *powers that be* not only determined to deflate but they also resolved to prevent, as far as possible, any discussion of their policy. In a recent letter on this subject Mr. Kitson says:

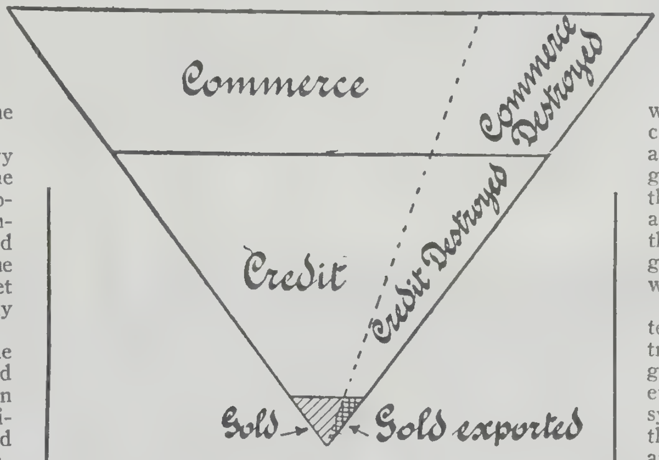
"The order to suppress discussion of the currency question in our journals seems to have been given about two years ago. The editor of a journal that published a number of my essays lost his position owing to the pressure that was brought to bear on the proprietor by the bankers . . . . About two years ago I was invited to a meeting of the Industrial League at the Guildhall, London. and a prominent member wrote to a friend of mine that as my name was practically to the bankers what a red rag is to a bull, he considered it was inadvisable that I should be allowed to speak, because the Industrial League depended on the bankers for its support. The invitation was canceled. I could give other illustrations of the intolerance shown by the money-lenders toward any open discussion of the money question. Of course I am allowed to speak occasionally at clubs controlled by men not directly connected with financial institutions."

This tallies with the experience of Wendell Phillips who could not get a line in the Boston papers on the money issue while he was given ample space on any other subject.

"There is reason to believe that governments are not, and have never been, particularly eager to find a remedy for poverty and unemployment. Had they been really in earnest, one would have expected that every possible avenue which promised salvation would have been explored and that substantial rewards would have been offered to the discoverer of the great secret. If it pays private firms to offer prizes for inventions for overcoming certain technical difficulties encountered in their businesses, surely it would pay any government to discover a panacea for the evils of trade depression."

"In all countries we find the same conditions of general unrest, dissatisfaction, and desire for better conditions, due to the failure of their economic methods to achieve the desired ends. Orthodox political economy has broken down and has had to acknowledge its failure. And as all our statesmen, professors, and writers on finance know little or nothing outside the orthodox books, they are all equally at sea and powerless to save humanity. All industrial nations are experiencing the same difficulties, for the reason that all are modeled on the same general principles."

"These principles have created what may be termed the pyramidal form of economic control. At the apex sits Finance, securely entrenched, dictating to Industry its commands—commands which on the whole are impossible of fulfillment. Industry is ordered to breathe into the inanimate the breath of life and make it a living soul, to make fruitful a thing which, as Aristotle told us ages ago, is by its very nature essentially barren. Finance hands over to Industry a sum of money and says: 'Take this and increase it. Make it grow. You cannot labor, you cannot produce, you cannot even trade without it, thanks to the world's money laws. Here is one billion pounds. I lend it to you on condition that you return me for its use one-twentieth part of it every year, and the whole of it *in addition to the interest* whenever I choose to call in the loan.'"



The relations of finance to trade and industry is graphically shown by the inverted pyramid. The shaded portion at the base of the triangle represents *legal tender*—gold, treasury notes, silver, and so forth. Upon this unstable and insignificant basis rests *bank credit,* and upon this we are forced to build our *trade, commerce* and *industries.*

"Now, by reducing the volume of legal tender, whether by exporting gold or destroying treasury notes, the volume of credit is reduced in the ratio of credit to legal tender. No banker will issue more than a certain proportion of credit to legal tender. Suppose this proportion is ten to one. Then, if the banker holds one million pounds in gold or treasury notes, he may issue ten million pounds of credit. If for any reason he has to reduce his cash reserves to, say, 750,000 pounds, he must call in twenty-five per cent of his loans—that is, 2,500,000 pounds. And this reduction of loans is, inevitably, the cause of business failures, decreased trade, and unemployment.

"Some years ago a gang of New York speculators withdrew eleven million pounds of gold from the Bank of England within the space of a few weeks. The result was, according to the *Bankers Magazine,* a doubling of our bank rate, and the fall in the prices of 325 of our premier securities of a sum equivalent to 115,509,000 pounds. Is it any wonder that the movements of gold were watched in pre-war days with such feverish anxiety? And it is this stupidly suicidal system which the government officials and the Sound Currency League are endeavoring to restore . . . ."

"If Industry had ever possessed one fraction of the intelligence proportional to its physical strength it would long since have made reply in some such terms as these: 'I am incapable of performing miracles. I cannot put your money in the ground and make it blossom and bring forth harvests of coins or bank notes. If you give me seeds or plants containing the germs of life, I can plant them and raise crops and return you far more plants and seeds than those you gave me. But when you lend me one billion pounds and ask me to pay you fifty million pounds per annum, I can only do this for a period of twenty years. By that time I shall have returned all you gave me, and as you alone control the issue, and since I have no power of getting more without your consent and help, you are asking me to do the impossible.'"

"'Further, this credit, which you alone control, on what is it really based? Evidently upon my work and upon my achievements. But for me and my energies, where would you be? The credit of which special laws have given you the control is the credit of the whole nation, and due to its productive capacity. You have done nothing to create or increase it. All you do is to hold on and profit by my labors. Yet you presume to dictate to *me,* to limit *my* power, to embarrass and torture *me* with your foolish restrictions, and to cause endless friction, contention, and disorganization between my associates, capital and labor.'"

"We have exalted the world's financiers above the nations themselves. For while the former can use their own credit as currency and charge for its use, governments are compelled to borrow the credit of certain of their own subjects, and pay for the loan. A private corporation like the Bank of England can issue 18,450,000 pounds of unsecured paper currency, can loan it and draw interest charges, and yet its creator—the nation—cannot issue a single five-pound note, but must hypothecate the national credit and pay interest whenever it needs more money than its chancellor happens to have collected. Isn't it humiliating? If the national credit will buy gold why is it not good enough for currency purposes? Can the stream rise higher than its source? In the realm of finance all our axioms seem to be fallacies. Since we mortgage the national credit and buy the individual's at his own price, a part must be greater than the whole."

"The usury system is the enemy of civilization, and is the disease germ of every economic system now existing. No system can function satisfactorily or beneficially for all or for the majority of the members of any community that is based upon this principle. One has only to calculate what the interest charges of any sum of money aggregate over an extended period of time to realize what an impossible system it is."

"Not long since an American humorist wrote to John D. Rockefeller suggesting a scheme by which he could enrich posterity. He proposed that Mr. Rockefeller should set aside one-half of his wealth on interest at five per cent, and leave instructions that the interest should be re-invested for a period of 500 years. By that time the income from usury would have become so vast that every United States citizen could draw an income of a million dollars per annum, supposing that the population by that time had grown to ten times the present population. The truth is that *usury can flourish only over a limited period of time,* and only to the extent of a certain small proportion of the capital created. It is very similar to a system of gambling. For every one who gains, there are scores who must be losers."

"A thoroughly scientific industrial and financial system would be one in which the amount of money distributed was sufficient to enable the public to buy all the goods the country is capable of producing. Now, it is evident to the least intelligent that our present financial system is based upon no rational theory connected with the national well-being. It exists merely because of greed and cupidity on the one hand, and superstition and dense ignorance on the other."

Dividends Come First

"GOVERNMENTS have handed over the supremely important power of manufacturing and controlling the currency to private companies; so that today it is a rigid monopoly, controlled in England by about ten banking institutions. And the directors of these joint stock companies are given power over the lives and fortunes of the whole of our people. Years ago Walter Bagehote said that upon the wisdom of the directors of the Bank of England it depended whether England remained solvent or became bankrupt. And considering that the first duty of these directors is to provide dividends for their shareholders, can we wonder that British trade is so uncertain and that unemployment is chronic at all times save during the tragic years of warfare?"

"The world's greatest and most dangerous monopoly is the monopoly of currency. During the silver controversy in America, Senator Depew, in a speech in the Senate, said there were fifty men in the United States who could close every factory, stop every wheel on every railway, shut up every telegraph office, lay up every steamship, close every mine, in short, paralyze the entire industrial system of America. 'They can do this' he added, 'because of their control of the money supplies through the banking system.' The same power is concentrated in just as few hands in England. *The control of money gives to a few men the power to build up or destroy whole nations."*

In an address on The Science of Plenty which Mr. Kitson delivered in Manchester, England, February 4 last and which was fairly reported in the *Manchester Guardian* he spoke, in part, as follows:

"Under the teachings of what our forefathers called the 'Dismal Science' the public were warned by the Rev. T. R. Malthus that Nature had perpetrated a terrible blunder by making human fecundity tend to outrun the means of subsistence, and that poverty and starvation were ordained by an all-wise Providence as a rightful check on population. 'A man who is born into a world already occupied,' wrote this Reverend economist, 'his family unable to support him and society not requiring his labor, such a man, I say, has not the least right to claim any nourishment whatever; he is really one too many on the earth. At the great banquet of Nature there is no plate laid for him. Nature commands him to take himself away and she will not be slow to put her order into execution.'

"This was the gospel of despair, of scarcity, upon which economics was built, and which is still taught in our schools and colleges today. It was the national creed at the time Karl Marx wrote his famous work 'Capital,' a time when the bulk of wealth was actually created by human labor, a situation which furnished Marx and his followers with their doctrine of labor's claim to all wealth. Few people seem to realize that the economic conditions brought about by inventions and scientific discoveries, during the past fifty years especially, have brought the world to a point where the political economy of Adam Smith and his followers is no longer applicable or even intelligible."

The Walloon Tercentenary Celebration

By JOHN DAVIS ANDERSON

TRACING backward three centuries, accepting the belief that New York was first settled in 1624 by Walloons, as French and Belgian Huguenots were called, the Huguenot-Walloon New Netherland tercentenary celebration is drawing near its close.

The international significance of the observance is testified by the fact that President Coolidge, Queen Wilhelmina of the Netherlands; Albert, King of the Belgians, and President Millerand, of the French Republic are honorary chairmen of the series of events.

Like their prototypes the Pilgrim Fathers, who in 1620 came to New England, the Walloons, numbering some thirty-two families, set sail from Holland in 1624. They had been neighbors of the Pilgrims in Leyden and sought freedom of religious worship. Walloon as a name was applied to residents of the French departments of Nord, Aisne, Ardenne and Calais and the Belgian provinces of Hainaut, Namur, Liege, Brabant and Luxemburg. They claim to have been the Belgae of Caesar's time and differed from their French neighbors to the south. The name "Walloons," as given them, signified strangers. They journeyed to Holland as exiles and there, at a later time, came into touch with the Pilgrims.

In 1609, the same year Hendrick Hudson discovered New Netherland, the Pilgrims, driven from England, were in contact at Leyden with Jesse de Forest's colony of Walloons. The latter had hoped to settle in Virginia but failed to get authority to emigrate. De Forest and fifty-six heads of families petitioned the British Ambassador at The Hague, July 21, 1621, in the name of two hundred and twenty-seven men, women and children, all of the reformed religion, who desired to settle in Virginia under certain stipulated conditions.

De Forest inquired whether it would please his British majesty to undertake their defense and protection and maintain them in their religion. The colonists offered to provide one ship if the king would furnish another and asked a tract of land sixteen miles in diameter where they could build a city, erect fortifications and elect a governor and magistrates.

The British state secretary referred De Forest's petition to the king. It was in the form of a round robin, to the Virginia Company. The latter offered to permit the Walloons and Huguenots to go to Virginia, but without any help from the company, because of the expense. It was further provided that the colonists should be distributed among the various communities in English possessions in America. De Forest and his associates declined to accept the conditions and the original request was repeated to the Dutch Government.

The proposal was given the newly formed West India Company and De Forest made another appeal on August 26, 1622. The day following "the said Jesse de Forest" was authorized to enroll for the colonies "all families having the qualifications requisite for being of use and service to the country, the same to be transported to the West Indies," the generic term then applied to all the New World.

Following this permission De Forest and ten heads of families, for some unknown reason, sailed on the ship *Pigeon* for the "Wild Coast" as Guiana was known, where a settlement was to be procured. De Forest died in Guiana of fever, October 22, 1624, and the others returned to Holland, some later going to the settlements called New Netherlands, which followed Hudson's discoveries in the region of what is now New York.

History relates that the *Niew Nederland* in the spring of 1624 was equipped for the voyage to New Netherland. It was a craft of 260 tons, or as they termed dimensions then, 30 "lasts." Cornelius Jacobsz May, of Hoorn, was skipper of the craft and arrived in the Hudson River. No list of the members of the thirty families on board has been preserved nor were records of the first fifteen years of New Amsterdam kept, but records later list many of the families which were on the "round robin" in the De Forest petition. These include La Montagne, Cornille, Campion, Catoir, Damont, De Carpentier, De Croy, De Crenne, Du Four, De La Mot, Du Pon, De Trou, Gaspar, Ghiselin, Gille, Lambert, Le Roy, Le Rou, Maton and Maryin.

In the rules and regulations prepared for the government of the new colony, the Assembly of Nineteen of the Dutch West India Company, at a morning session, March 28, 1624, is reference to "provisional conditions on which respective colonists were sent to New Netherland in the service of the West India Company to take their abode on the River of Prince Maurice (the Hudson River) or at such other places as shall be assigned to them by the Commander and his Council." The colonists were enrolled the next day and one of their articles of provisions follows:

"Within their territory they shall only worship according to the true Reformed Religion, as it is done within this country (Holland) at present, and by a good Christian life they shall try to attract the Indians and other blind persons to the knowledge of God and His Word without, however, committing any religious persecution, but freedom of conscience shall be left to every one, but if any one of them, or if any one within their territory shall intentionally curse or speak blasphemy against the name of God and our Saviour, Jesus Christ, he shall be punished by the Commander and his Council according to circumstances."

It is believed the *Niew Nederland* was accompanied by another vessel; possibly a third one was in the fleet. The colonists were deeply religious and had prayers and singing on board ship morning and evening and at mealtime. The *Classis of Amsterdam* had provided a "comforter of the sick," or lay chaplain, Jansen Krol, and, according to tradition, four couples were wed on the trip across the Atlantic. Sarah Rapalje was the first white girl born in the colony, her birth taking place in 1625.

Following their arrival at New Netherland, some of the Walloon colonists were sent to the Delaware River, others to Connecticut, others were left on Manhattan Island but the greater number were taken up the Hudson River and settled at Fort Orange.

By tens of thousands the French Huguenots came over and, like the history of the Pilgrim, lost from the period from 1690 to 1850, the traditions of the Walloons were forgotten for a long time, despite their early settlements of homes in the Middle States.

The Huguenot-Walloon celebration is a forerunner of the big Dutch celebration two years hence of the colonization of Manhattan Island by emigrants from Holland. It is a matter of history that in 1626 Governor Peter Minuit bought the island of Manhattan from the Indians. The new province of the Dutch Republic was named "Terra Nova Belgica" or New Netherland.

"Dark as night,
Here, amid cliffs and woods, with headlong might
The black stream whirls, through ferns and drooping sedge,
'Neath twisted roots, moss-brown, and weedy ledge,
Gushing;—aloft, from yonder birch-clad height
Leaps into air a cataract, snow-white;
Falling to gulfs obscure. The mountain ridge,
Like a gray warder, guardian of the scene,
Above the cloven gorge gloomily towers."
—Sir Aubrey de Vere.

Why Booze Propaganda in Some City Dailies Is Wasted

By W. C. POOLE

THE city dailies which carried whisky advertisements until the postal laws compelled them to clean up or clean out of the United States mails are now the sole sources of aid and encouragement to the outlawed Booze business.

A very few big city dailies are not unlike a certain big German gun which fired a shot each day into Paris from a very long distance. The shot created a sensation and stirred the Allies to greater zeal—but it did nothing toward winning the war, which was eventually won by the greater number of smaller guns and shells and soldiers of the Allies, and the big gun increased the loathing for the nation which would use it against harmless, unarmed non-combatants.

Ninety per cent of our big city dailies are loyal in upholding the laws and Constitution of our country.

However, the great safeguard of prohibition has been, and still is, some thirteen thousand country weeklies that go back into the millions of homes on farms and in country towns that never trouble themselves about city dailies and seldom read them or think about them. Unless one has been a country minister or doctor he cannot fully appreciate the facts that country homes are not even slightly affected by propaganda in city dailies, which is quickly exposed by the county weekly, the farmers weekly or monthly, the church weekly, the day school teacher, the Sunday school teacher, and that other man who is never very far off—the country preacher. Against such a bulwark booze propaganda may make itself ridiculous but never victorious.

But there is another still greater influence for prohibition and law. Practically every journal for women, of which there are many, with more than a million subscribers each, demands prohibition and law enforcement. The city daily is out-of-date and probably in the fire in a few hours after issue, while I have actually gone into many homes and found their monthly journals carefully preserved and referred to for a full year after publication.

But there is another class of still greater influence, and that is the big weeklies for business men. They are read by millions. I hesitate to mention by name any of these publications but the circulation of the various classes may be approximately stated as follows:

The home monthlies, over ten million circulation; the business weeklies, ten million; the farm weeklies and monthlies, twenty million; the county weeklies, twenty million; the various church weeklies, five million; the monthly magazines, ten million.

Some of these estimates may not be strictly correct, but they are the best to be had at this moment. Even with these facts, it is easy to understand why Congressmen and Senators go down to Washington and cast three or more Dry votes for every Wet vote. It is hard to understand why a few city dailies are so partial to city slums that they seem to cater to them.

The Evolution of the Map of the World

Concluded from page 5

astronomical observations of French scientists combined with measurements of a degree on the earth's surface enabled Guillaume De L'Isle to bring out his world map of 1700 in which not only the Mediterranean Sea is given its proper width, but also in which the attendant errors in the longitudes of North and South America are largely corrected. This marks the beginning of the period of modern maps. Although for nearly a century other European map makers continued to sell the old and incorrect maps, nevertheless the scientists and students widely recognized that accuracy was found only in the French maps based upon astronomical observations.

The map of the world which we have today stands as a monument to the explorers, of all ages and of many lands who in many instances gave their lives to the advancement of our knowledge of the world; the map is a monument to astronomers and to mathematicians of all the ages who devoted years of study and of labor to searching the heavens and to the problem of representing upon a plane surface the configurations upon the spherical earth; the map is a monument to geographers and cartographers who combined the achievements of the discoverers with the achievements of the astronomers and mathematicians in a picture which we all can read; and, finally, the map of the world is a monument to the printers who through centuries have studied the art of reproducing the written word and drawings to make intellectual products available to wide circles of readers.

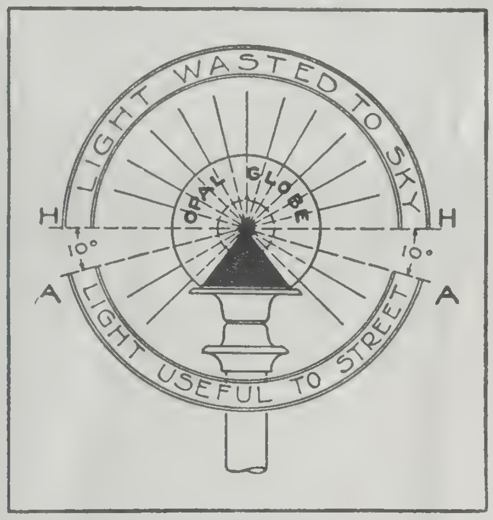
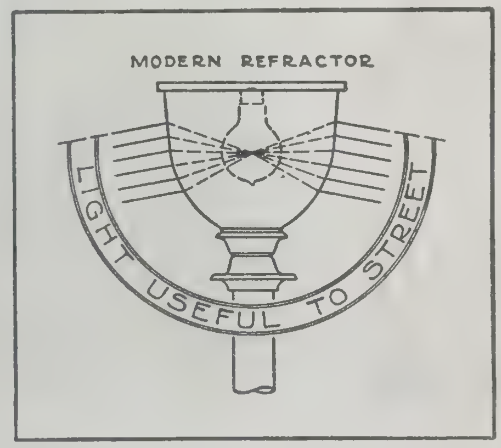
President, Ramsey Institute of Technology, St. Paul, Minnesota.

Scientific Street Illumination

RECENTLY attention was emphatically directed to the importance of scientific street illumination through a lecture entitled, "Street Illumination for Cities and Towns," delivered by Hans J. Meyer, one of America's foremost authorities on this subject. The invention of the arc lamp and the electric light gave rise to that branch of engineering which is known as "illuminating engineering." Scientific street illumination, however, is of very recent origin. We are undoubtedly correct in stating that this definite branch of science had its origin in the Milwaukee office of Vaughn, Meyer & Sweet (consulting engineers) in the year 1912. The preliminary scientific investigations of the fundamental principles of street lighting are due to Arthur J. Sweet, who, in 1912, began this work for his concern. During the summer of 1914, John N. Cadby, of the Wisconsin Railroad Commission, and Professor Edward Bennett, of the University of Wisconsin, cooperated with the engineering firm of Vaughn, Meyer & Sweet in further developments and investigations of this important subject.



An unscientific device for the distribution of light. The light rays pass radially outward from the light source with the result that a large percentage is wasted to the sky and only a comparatively small street area is illuminated.



A scientifically designed modern refractor which redirects the light rays to the street surface, distributing the rays more uniformly over a much larger street area and assists in the reduction of the wasteful and disagreeable blinding effect of glare.

Hans J. Meyer, who is at the present time a practicing consulting engineer in the city of Minneapolis, continued this pioneer work with exceptional vigor, in the face of powerful opposition from some manufacturing concerns who have failed to realize that, in the long run, the best interests of the controlling stockholders are bound inseparably with the highest and most honest public service. The faithful professional work performed by H. J. Meyer in scientifically safeguarding the public interest, is a noteworthy example of the high value of the recommendations of a fearless, honest, and able engineer, concerning all matters which pertain to our practical daily life and common welfare.

Civic street lighting was first attempted by the city of Paris in the year 1558 when the citizens were ordered to place lighted candle lanterns in front of their residences. Later (in 1766) pitch or resin bowls were substituted for candle lanterns. London first introduced illuminating gas for street lighting in the year 1809. Mr. Meyer has called attention to the fact that about one hundred years ago many European cities were opposed to street lighting on theological, juridical, medical, moral, and economic grounds. At the present time the basis of opposition rests upon economic grounds. This modern objection is entirely untenable because adequate street lighting will pay for itself by decreasing accidents and burglary, and increasing the general public security. What municipalities and towns should guard against is improper and wasteful systems of street lighting.

Much opposition to adequate street lighting is due to lack of definite information concerning the relative cost factors and expenditures in municipal departments. The following data was given by Meyer in his lecture:

"Cities of more than 30,000 inhabitants spend on an average $5.25 for safety and protection including street lighting. The average per capita cost a year for street lighting in 747 cities, recently investigated, was seventy-one cents. The poorly lighted villages spend two cents a linear foot of street a year, while San Francisco, in its 'Path of Gold,' spends five dollars. Five cents a foot is a fair average figure for the cities of the United States."

The three cardinal principles which should be observed in the design of street lighting are, according to Meyer: First, efficient generation of light; second, efficient utilization of light; and third, keeping the eye in an efficient condition for seeing. The efficient generation of light is possible through the use of such devices as the magnetic arc and the gas-filled tungsten lamp. In discussing the second requirement, Meyer pointed out that this problem involves primarily the proper distribution and the redirection, to the street surface, of the generated light rays. The most important factor, however, is keeping the eye in an efficient condition for seeing. This requires that the blinding effect of glare be minimized by placing the lamp high above the street surface.

About fifty per cent of the light from an ordinary electric bulb is emitted above the horizon. This percentage, therefore, represents wasted light as far as the street surface is concerned. Moreover, the light rays which actually pass in a downward direction are, by no means, distributed in a manner which insures their maximum usefulness. Directly under such a lamp the illumination is comparatively bright. The radius of this relatively bright illumination is about twice that of the mounting height of the lamp. Beyond this zone the illumination decreases rapidly to a very low value. This faulty condition is not corrected by equipping the lamp with a white or opal globe because such a device does not redirect the radially emitted light rays. The only valuable effect of this type of globe is the reduction of the intense brilliancy of the light which diminishes the ocular discomfort. In fact, such a globe is only useful as a protection for the lamp while enhancing the general appearance of the light unit.

HANS J. MEYER,

Prominent conservation engineer, administrative engineer for the state of Minnesota during the period of the World War, consulting electrical and mechanical engineer, and one of America's foremost authorities on scientific street illumination.

In concluding his important discussion Meyer summarized the essential factors in scientific street lighting as follows:

1. Light must be efficiently generated by the use of economic lighting units.

2. The wasting of light to the sky must be prevented by the use of such devices as the prismatic refractor which redirects the light to the street surface.

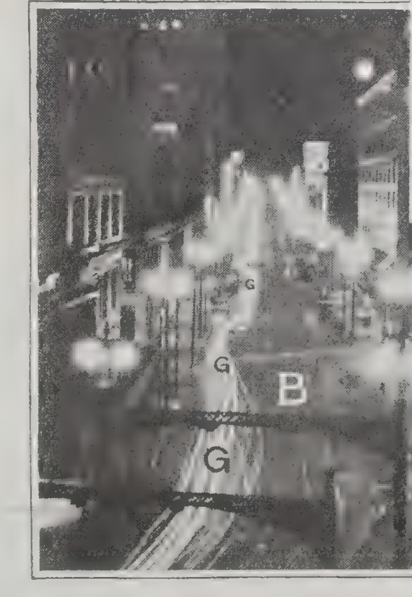
This is an actual night photograph of an improperly lighted street in one of our principal cities. Each lighting unit consists of a five-light cluster equipped with opal globes which do not redirect the light rays to the street. The mounting height is twelve feet. Note the poor illumination along the street surface at *A*. The intensely lighted strip at the left, marked *G*, is due to the light projected from automobile headlights.

3. The blinding effect of glare must be reduced to a minimum.

4. Wherever conditions permit, a mounting height of from twenty-eight to thirty-two feet should be used.

5. Uniform lighting must be provided by establishing a proper relation between the mounting height and the distance between the light supports.

6. The light intensity should be graded in conformity with the requirements of each particular district.



An example of a scientifically illuminated street in one of our best lighted cities. The light rays are redirected to the street surface by means of modern bowl refractors. The mounting height is thirty feet. Compare the lighting at *B* with that at *A* in the improperly lighted street. Also note the relative illumination on the sidewalks in both cases. The zigzag light striations *G*, in this case also, are due to the light transmitted from automobile headlights.

UNIV OF ILLINOIS
URBANA ILL

BRIEFLY TOLD

In 1857 it required 274 hours of labor to grow a bushel of corn, including the preparation of the ground, the sowing, care and harvesting. It can now be done in about twelve minutes of labor.

The Egyptians made glass long before the birth of Christ.

The Rothschilds family of Vienna, international bankers, were taxed $72,000 for the forty-seven servants kept.

Norway is celebrating the 900th anniversary of the coming of Christianity to that country.

The first bathtub in America was exhibited by Adam Thompson at Cincinnati in 1842. It was supplied with water from a tank in the attic and was strongly denounced as injurious to health.

"Let's clean house! Weed out the rubbish and litter that are clogging Judaism and making much of the criticism we receive justified." *The Jewish Voice.*

"White Australia" is the form that land's immigration philosophy takes. "Nobody has got into Australia whom we have wanted to keep out," says ex-Premier Hughes. "It was Australia and California that saw to it that the League of Nations Assembly did not go on record as favoring world racial equality."

A gold coin from the United States labelled *"Christian Idol From America"* is part of a collection of idols from many lands possessed by a man in India.

Light travels 186,000 miles per second and radio waves 165,000 miles per second.

Vast tracts of potential rubber-growing lands have been found in the Philippine Islands. Ninety per cent of the world's supply of rubber is produced by British colonial and other foreign producers.

To test the theory that "any bright criminal could prove himself insane and thus escape punishment for his crimes," a Des Moines, Iowa, newspaper reporter played the part of the insane man, was officially adjudged insane by the sanity commission, which remanded him to the state hospital at Clarinda, all in such fine order that the young reporter had difficulty in extricating himself.

More than 20,000 houses have been built in Yokahama, Japan, since the earthquake.

The state of Michigan a year ago placed 65 imported Norwegian reindeer in a northern part of the state in a country similar to their native habitation. Only seven of the herd are left. Lack of calcium composition in the Michigan moss is said to cause paralysis of the hind quarters, resulting in death.

Records found in the tomb of Tutankhamen indicate that there really was a Helen of Troy and there was a Trojan War and that the historical records of Greece on this subject were based on fact and not the imagination of a roving Greek minstrel.

"The International Jew," a four-volume series on the Jewish Question, may be obtained from The Dearborn Publishing Company, Dearborn, Michigan. This set includes:

"The International Jew," Vol. I, 235 pages; "Jewish Activities in the United States," Vol. II, 256 pages; "Jewish Influence on American Life," Vol. III, 256 pages; "Aspects of Jewish Power in the United States," Vol. IV, 246 pages. The price of these volumes is twenty-five cents each; the complete set, four volumes, one dollar.

Small bladed knives were used in the olden days to repoint the long quills used for pens, hence the name penknife.

The Chinese have long employed tame cormorants to catch fish. These birds are prevented from swallowing their captures by a strap placed about the throat.

The British Sovereign is still officially described as King of the United Kingdom of Great Britain and Ireland, although the United Kingdom of Great Britain and Ireland came to an end with the establishment of the Irish Free State.

Rudyard Kipling is living the quiet life of a farmer in Sussex. His farmer neighbors discount his literary activities, but give him full credit for his knowledge of farming.

Scores of persons were overcome by automobile exhaust fumes in the twin Liberty tunnels at Pittsburgh recently when traffic was tied up and hundreds of cars with engines running were stopped. Airshafts proved insufficient, and more than twenty persons were sent to hospitals.

A persimmon that will not pucker the mouth has been found in Japan.

Child & Company, the oldest private bank in England, founded about 1560, is to be absorbed by Glyn, Mills & Company.

It is said that fifty per cent of the Hungarian national wealth is in the hands of the Jews.

It is said that there has been an increase of only $400 per year in the maximum salary of postal clerks in forty years, while the cost of living has doubled and trebled in that time.

Figures issued from Hollywood last summer indicate that the films which paid the best during July were the most wholesome pictures ever made.

According to a Czecho-Slovakian superstition. if when a traveler sets out on a journey, you stock him with round cookies, he will surely return.

Forty-six cities of the United States show one hundred per cent boost in rentals during the last ten years.

"If I had my way I would put a cradle beside the flag on Empire Day and when the girls of the schools came to salute the flag I would make every girl salute the cradle."—*Lord William Gascoyne-Cecil, Bishop of Exeter.*

In three years the item of pilferage cost the American railroads eighteen million dollars.

A delegation representing the Chinese Association of Tokio recently called on Foreign Minister Matsui and presented a memorial protesting against Japanese exclusion of Chinese, declaring that the Chinese expect the same consideration from Japan that Japan is seeking from the United States.

Lord Olivier, Secretary of State for India, says that when officials are regarded as seeming unsympathetic to native people, it is found that the missionaries are able to attain a perfect sympathy and understanding.

The centenary of the Monkland and Kirkintilloch Railway, the first public railway in Scotland, is due this year. The railway was authorized in 1824, opened in 1826, and amalgamated with the North British Railway in 1865.

An observer in the book-repair workroom of a Philadelphia library noticed that of books published in volumes, Volume I invariably had to be repaired but Volumes II and III needed only a little attention and that after long periods.

Guatemala grass introduced from Central America and Mexico is now being used on a large scale by dairymen in Southern Florida.

Astoria, Oregon, is being rebuilt along lines of rat-proof construction.

A college student at Williams College in 1842 wrote this in his diary: "Today we pursued no studies, but rather made merry with a girl school which came in a body for dancing, and frolicking of all sorts. And till late at night we barn danced and polka'd, and such was the attraction that we thought no more of books and learning but contended ourselves with singing and dancing of all sorts. These females are a queer lot, but they are fine after books and Greek authors."

Archeologists excavating in Old Mexico have discovered fragments of human skeletons, pottery, and so on, which they are convinced belong to a race and civilization antedating the race which antedated the Toltecs.

The golden plover with less than two ounces of fuel in the shape of body fat forces itself at a high rate of speed over hundreds of miles. If a 1,000-pound airplane could operate on the same ratio, it would do a 20-mile flight on a single pint of fuel.

George Bernard Shaw says he is a Communist. "My wants," he said, "are very few—a nice little flat in the West End of London, a pleasant country house not too far from London, a couple of motor cars, £2000 or £3000 pocket money, and there is no more contented man in England than Bernard Shaw."

Are Advertisers Killing New York Newspapers?

Is Munsey, in Journalistic Deals, Backed by Department Stores?

By HENRY M. WHITE

ON THE bulletin board of the New York Newspaper Club is pasted a bit of verse:

Some of the members laugh as they pause and scan the doggerel.

THE ITINERANT REPORTER

Say boss, can you give me a job?
I'm fairly good, I guess.
One time I worked with Munsey
On the New York *Press*.

Oh yes, I've had experience,
And many's the yarn I've spun.
I also worked with Munsey
On the New York *Sun*.

I won't say that I was a star
Nor wore any royal robe;
But I did have a job with Munsey
On the New York *Globe*.

You say the staff is full up—
Well, I'll be hittin' the trail.
But remember, I worked with Munsey
On the New York *Mail*.

I then joined up with the *Herald*
And that was a terrible jam,
And, let's see—I worked with Munsey
On the New York *Telegram*.

There is another small paragraph there, clipped from some publication or other:

"It is understood that Frank A. Munsey intends combining the *Literary Digest* and the *Police Gazette* and retaining the best features of each."

This wins a laugh, too—from some of the members. Newspaper men, naturally enough, have a sense of humor, especially when they are young, and what passes for the romance of the game is still in their blood.

What's the Low-Down?

BUT there are two groups among the newspaper club's membership of 1,000 from whom come not even smiles over the witticisms. One group is made up of a couple of score writers who find themselves jobless because of the recent sale of the *Herald* to the *Tribune* by the aforementioned Frank A. Munsey. The other group includes the more mature news writers of the city—the men who have passed forty and have given perhaps twenty of their years to the half-altruistic, half-hypocritical service of providing "information" to New York's millions. These men want to know:

"What's back of Munsey's buying and eliminating and merging newspapers? Why is he doing it? What's the low-down? What's going to happen to the journalistic field of New York if this tendency goes any further?"

(Newspaper men who are worth their salt always wonder what is the "low-down" behind anything that comes under their attention. Their training teaches them that rarely is there 100 per cent of actual honesty in business—or politics or various other public movements—and that things are not usually just as they appear on the surface.)

Little wonder, then, that they queried each other as to what might be concealed behind the Munsey manipulation of daily papers that had been going on for a number of years and had recently reached a peak of activity.

Perhaps there ought to be given right here a little chronology of Frank A. Munsey's connection with New York City journalism. New York journalists know it but one cannot expect that the whole country is familiar with it.

Journalistic Gymnastics

MUNSEY, a down-east Yankee of the "hoss-tradin'" type, who had originated in Maine and had made considerable money out of cheap fiction publications, bought the New York *Evening Star* in 1890. It was a rather fair paper. But it's gone; it died within a decade. In 1901 he bought another, the *Daily News*, which was then an evening gazette. That passed away on his hands within three years.

In 1912 he ventured into the morning newspaper field. He purchased the *Press*, which was just managing to get along financially because it was the one outright Republican organ in the Democratic metropolis. As soon as he laid hands on it the *Press* hit the toboggan. People began to forget that there ever existed such a sheet. There is a classic newspaper story of a *Press* reporter who wandered into a lunch room and, seeing a bundle of papers behind the counter, inquired: "Have you got a *Press* there, chef?" The cook's reply was: "No, we don't often see them Brooklyn sheets uptown here, boss."

So the *Press* died—at least it "died a Munsey death"—in 1916. In that year the publisher purchased the historic old *Sun*, with its less artistic but richer young sister, the *Evening Sun*, and merged the *Press* with the morning *Sun*, made famous by Charles A. Dana.

It was then that the pet Munsey expression, "retaining the best features of each," came into being. That's what he was going to do, he said—but we old-timers can't recall any particular feature the *Press* had (after Munsey had played with it for a time) that was worth retaining. And what features the old *Sun* had soon faded away.

The question was raised: "What is Munsey trying to do?"

For a brief period the title of the combined papers was "The *Sun* and the New York *Press*," but the latter half of the appellation vanished before many weeks had elapsed. And thus passed away another New York journalistic landmark.

Munsey's next move astounded not only newspaper circles, but the city at large. In 1920 he bought the properties of the deceased and picturesque James Gordon Bennett, the New York *Herald* and the *Evening Telegram*, and consolidated the *Herald* with the *Sun*, the title now becoming: "The *Sun* and the New York *Herald*."

"Why?" queried the newspaper men again. There was no satisfactory answer. It was announced once more that Munsey would "retain the best features of each." The journalists inquired: "Which of the two is Frank the Paper Killer going to strike dead?"

They did not have long to wait. It was the journal founded by Dana, the *Sun*, which perished. The *Herald*, of the consolidated papers, survived, and the name the *Sun* was given to the sheet which theretofore had been known as the *Evening Sun*. There was another notch in the big stick of the paper killer. Incidentally, there was sudden unemployment for a number of men who had labored loyally and long for the two famous papers, the *Sun* and the *Herald*. But of course that's the tragedy of all consolidations.

"Buy 'em and kill 'em" continued to be the motto of Munsey. In June, 1923, he purchased another evening paper, the *Globe*, and merged that with the *Sun*, announcing, as usual, that he would "retain the best features of each." Title: *"The Sun and The Globe."* Some *Globe* men, some *Sun* men, lost their jobs. Shortly the name of the *Globe* disappeared from the masthead. Another historic gazette gone, for no less a personage than Noah Webster started the *Globe*, way back in 1793.

But historic associations meant nothing to the man from Maine. As one of the irreverent scribes expressed it: "That bird would probably merge the Statue of Liberty and Bunker Hill Monument—and retain the best features of each."

In January of this year, Munsey bought the *Evening Mail* and merged that with his *Evening Telegram*. Before long, it is expected, the name *Mail* will disappear.

Then—biggest shock of all his maneuverings—in March he sold the *Herald* to Ogden Reid, and the famous old Bennett paper was consolidated with the *Tribune*, which Horace Greeley founded.

The name *Herald* still is alive—since the title is *New York Herald-New York Tribune*—but no one knows what the future may bring forth.

How Advertisers May Save

THE old question "Why?" was reiterated. "Why kill the *Press*, the *Sun*, the *Globe*, the *Mail*, and virtually kill the *Herald?*" In his purchasing transactions, Munsey had apparently handed forth great sums—in no case less than a single million of dollars and in other cases this sum multiplied several times. "Why put out all that money for the sake of obliterating newspapers?"

Finally there gained currency a suggestion that may be the correct answer to the Munsey activities:

"Is it really Frank A. Munsey who is doing this? Or is it the big advertisers—the department stores—the Saks and Macys and Gimbels and Sterns and Altmans and Simonses and Giddings and the like?

"Is it Munsey's money that is being spent that these old-established broadcasters of news may be led to the slaughter? Or is it the money of the farseeing merchandisers of a race that is always farseeing where money is concerned?

"Is this cold Maine Yankee indulging a peculiar passion, or are the Semites of the Shops, under cover of his odd personality, wiping out of existence one paper after another, so they will be obliged to advertise in fewer and fewer, and thus will save, eventually, enormous sums?"

There was a widely circulated report, when Munsey bought the *Mail*, that it was not his own money which was spent for it, but "department-store money." Then there began to develop the idea that possibly this same financial backing was behind his other purchases.

The *Mail* was the weak sister of the evening newspaper field in New York. But the situation was this: A certain number of persons read it every day—one hundred and some odd thousands, maybe. The advertisers wanted to reach these, of course, with their bargain-offerings and the like. They were obliged to advertise in it, even though they felt that to a certain extent this was a waste of money.

How, then, avoid this expense? The answer was elementary: kill off the paper. But how could that be done? Very simple, also: buy it and close it up. But that wouldn't look well if done by a lot of department stores, would it? No! But that phase could be avoided.

Going back a step, the *Globe* was not so strongly entrenched either, although it had more readers than the *Mail*. The big advertisers were in the same situation with regard to Noah Webster's original paper. They were glad to see that out of the way.

Going still further back, the old *Herald*, as it was at the time of Bennett's death, was rather a weakling. So was the old morning *Sun*. So, in the beginning, was the *Press*. There were no tears of regret shed by the big advertisers who put forth many thousands of dollars a day for newspaper space, when any of these institutions passed out.

"Is it not possible, even probable, that the advertisers had a big hand in the executions?" the thoughtful newspaper men are inquiring.

It is obvious that the advertisers save great sums every time a paper goes out of existence. The fewer advertisements they have to put out, the less their expenditures in that direction, naturally. The surviving papers may increase their rates, of course, but the increase by no means brings the total up to what it was previously.

There is no way for a working newspaper man to learn just what the truth is in this whole matter. Munsey—apart from statements which he invariably issues whenever he puts over a newspaper deal—is a silent man. The department store people, presuming they actually had a share in these transactions, naturally, wouldn't talk about it—but it has come to seem rather plausible to the writing boys.

Munsey's last statement, printed when he sold the *Herald* to the *Tribune*, said:

"My work of amalgamating newspapers*** in New York has been as sound a piece of economics as the amalgamation of competing lines of railroads or banks or manufactures ***"

Not a Helpful Thing

POSSIBLY it has been sound economics—for Munsey finances and for the big advertisers. But it hasn't been a sound or helpful thing for the New York public, at least in my opinion and in that of many another journalist who has given half a lifetime to newspaper work. (I might explain—lest I be suspected of possible bitterness—that I never worked for Munsey and never was affected by any of his deals.)

Any narrowing or shutting-off of the streams from which flow information to the people is dangerous, I contend. The fewer the flowing streams, the less, in both volume and variety, will be the information that reaches the people. And (though this, of course, is merely a personal view) there never has been a time when the people needed, more than they do now, all the information they could get about what is going on in business, in politics, in civics, in the really important things of life.

It does not seem to me that the New York public ever got as much real information as it should have had, even before this killing off of its newspapers. And it does not seem to me that there is an entirely independent newspaper in the city of New York today.

The *World* is possibly the nearest approach to an independent that we have. Occasionally it picks up some worthy cause, makes a crusade of it, and carries on to a worth-while victory. But on the other hand, it picks up unworthy causes and persists, just as vehemently, in exploiting these. It has been waging, for years, a silly semi-personal fight against the city administration as represented by Hylan, the mayor, and Enright, the police commissioner, who, as a matter of fact, are pretty good officials and have kept the city as clean and safe as a place like New York can be kept. The *World* is controlled by the Pulitzer family, sons of the really great journalist, Joseph Pulitzer, who built it up from almost nothing and who died, blind, at the peak of his success.

The *Times*, owned by Adolph Ochs, once a newsboy in Chattanooga, is the bulkiest of our papers, and attempts more seriously than any of the others to present news from all over the globe. But the *Times* has a "play-it-safe" policy. It generally remains neutral on a big issue until it sees which side has the better chance of winning, and then hops to that side. Also it is very deferential to Wall Street and the big money-powers down there. You don't find any crusades or aggressive movements in the *Times*.

The *American*, one of the country-wide string operated by William Randolph Hearst, is fearless enough, but most of its space and energy is devoted to the personal concerns—political and business—of "W. R." himself. Hearst's friends (according to his papers) are invariably all right; his foes are invariably all wrong.

A Wonderful Opportunity

THE *Tribune* (now the *Herald-Tribune*) in recent years has been an easy-going, undetermined sort of paper. Sometimes it has tried to do things, but it has always gone at them half-heartedly and never has got anywhere to speak of. The only thing in which it has been entirely steadfast has been its support of all Republican administrations, right or wrong. Nothing striking has been accomplished by the amalgamation. The result is a paper that is neither the old *Herald* nor the old *Tribune*.

The *Daily News* is our paper of greatest circulation. This is a little tabloid form of journal, composed largely of photographs, and exploiting crime, scandal and sports. Yet it has the astonishing circulation of nearly 750,000, as against about 400,000 for its nearest circulation-rival, the *World*. Again to quote an irreverent reporter: "That's the tip-off on the intelligence of New York City, when so many people read that rag." However, maybe the answer is that New Yorkers don't have, or don't like to use, much intelligence. Not much is called into play by the reading of the *Daily News*. It is owned by the Patterson-McCormick interests which also possess the Chicago *Tribune*. It has no especial policy—certainly no constructive policy. A rather narrow little group—isn't it?—to supply the morning needs of nearly 6,000,-

An Interview With a Gorilla

Being an interview with the only gorilla in captivity, a gentleman of temperament who has quickly adopted the ways of civilization, and who scientists believe proves the theory of evolution.

By COURTENAY SAVAGE

JOHN DANIEL II

Photos, General Photographic Service.

"NOW go to sleep—that's a pretty boy."

A woman stood by the side of a big four-poster bed, and with crooning words tried to urge sleep on—no, not a child—but a gorilla. It was probably the strangest sight to be found in all the United States. A beautiful hotel bedroom, furnished in the fashion that would attract the most feminine of fancies, and there by the mahogany bed a woman standing looking down on the tired, restless form of one of the fiercest beasts that ever roamed the jungles of the far-away places of the earth—a gorilla.

The woman was Miss Alyce Cunningham, of London, and the thing that impresses you at once is that she is in no sense a seeker of notoriety—in no sense an "animal trainer," but just a cultured woman who is busy conducting one of the most interesting experiments of modern times, one that scientists all over the world have watched with great interest, for she has taken a beast that has never been known to live in captivity, a beast long considered closely related to man—and she is watching the effect of civilization on the jungle-born mind.

John Daniel II is really a study in environment.

"The history of John Daniel really goes back several years, to the day when I found the first John Daniel." Miss Cunningham left her place at the foot of the bed and found a chair. The gorilla on the bed had settled himself comfortably, but he was not asleep. Far from it. His large dark eyes were watching us, brooding eyes that seemed to read our very thoughts. One hand was raised to his forehead, as if shading off the light, while the other was clasped about his ankle.

"The first John Daniel," Miss Cunningham went on, "was in a London department store when I met him. He was in a big cage, and was advertised as the only gorilla in captivity, 'a special treat for the children.' He was about the most unhappy beast I had ever seen, and I felt sorry for him at once. But just the same I took occasion to remark that it seemed a shame to advertise the gorilla as the only one in captivity. I felt sure that I had seen many in the zoos of the large cities of Europe. I discovered, however, that I was wrong. I had seen chimpanzees, orang-outangs, and baboons—not gorillas, for gorillas lived but a short time in captivity—pining away when caged.

"The more I thought about that gorilla, the more it seemed to me that it would be rarely interesting to own the beast—and finally my nephew, Mr. Penny, and I decided that we would buy the gorilla, and see if we could keep him alive. The department store people thought we were crazy, but were quite willing to sell. So we took the gorilla home, and named him John Daniel.

"Almost from the very minute that gorilla was brought into my home it was possible to observe the effect of close contact with humans on his mental and physical condition. He lost the melancholy air he had worn, he showed great interest in people, ate well, and thrived physically. In six months we opened the cage, and began to treat him as you would treat a child of about the same age. His intellect was remarkably keen, and his actions those of a child. I was persuaded to bring him to this country so that he might be exhibited publicly. I left him in the United States while I returned to England on business, and he actually died of a broken heart.

"The next gorilla I owned was Chula. I had become so interested in gorillas that with my brother I went to the French Gaboon, a division of the French Congo, and obtained my second gorilla. Chula never appeared to be normal, and he died shortly. An examination showed that he had suffered from an abscess on the brain. Of course, I am not sure of this fact, but I have always felt that in capturing Chula the natives had struck him on the head, and the abscess was the result.

"My third gorilla is that fellow on the bed. I've had him about ten months, and I should judge that he is between three and three and a half years old. He is by far the brightest of the three, and he has accustomed himself to civilization very quickly."

By this time John Daniel was asleep. He had rolled over during Miss Cunningham's description, and was quiet. Once he whimpered. Perhaps he was dreaming of other days when his bed was a heap of leaves, and when he had not known the luxury of gayly colored blankets, taxicabs, and chicken à la king, which is his favorite dish.

John Daniel II was about three years old when he was captured by the natives. That is the age when it is possible to take a young gorilla. Before that time they are kept under close surveillance by the mother, practically never out of her sight. By the time the young animal is between two or three, however, the mother usually has a younger baby to take her attention so that when the family is on the march the three-year-old may lag behind unnoticed. It is then that the waiting natives effect a capture. A heavy cloth is thrown over the gorilla's head, and while the beast is wondering what it is all about, the natives pick it up and run like mad. That was the way John was captured.

The first few months were naturally spent in a cage, but John very quickly demonstrated the fact that he understood that Miss Cunningham wished him to be a gentleman. When he was first allowed his freedom he naturally took advantage of his liberty and misbehaved—but he soon learned that humans were not meant to be bitten by gorillas, and that if gorillas did not attempt to smash up a room they were allowed greater privileges.

"Of course, when he's naughty I have to give him a taste of the rattan," Miss Cunningham said, "or I lock him in his cage. He always knows when he has misbehaved, and as a general rule I can scold him, and make him understand. He acts like a child when scolded, ashamed, and very anxious to show that he is sorry. Of late he has thought out a rather strange method of showing this sorrow; he puts both his hands on my shoe and bows his head till it touches his hands. Shoes really play an important part in John's life; they fascinate him. On numerous occasions when I have had a visitor whom John really likes he has gone over to them, unlaced or unbuttoned their shoes, and then taken the shoe off. I don't know why he should think of such a trick. It certainly shows an originality of thought."

Compared with his native jungle life John's whole existence is decidedly original. Morning finds him waking up in his cage, which is not really a cage, being more like the "kiddie-coops" one sees in the modern nursery. He is placed in this "cage" when Miss Cunningham is ready for bed for the simple reason that he is apt to roam in the night, and might accidentally do harm to himself or his mistress. The "cage" is equipped with a hammock, and there are blankets so that if John feels cool he can cover himself.

"Of course, I have always slept with my windows open," Miss Cunningham explained, "and I decided that if it was good for me to get the cold night air it would also be good for John. I really am doing almost everything that zoologists have told me not to do, but John thrives under the treatment. I was told that a gorilla would not live in any climate that was not tropical. However, my idea was that if John could be warm when he wanted to, he would be hardened by the cold air. When he feels cool he has sense enough to put on his blankets. As a matter of fact he has played in the snow, and really enjoyed himself. He had never seen snow until the day I took him out, but he played with it just as a child does."

So much for John's night of fresh air and warm blankets. When Miss Cunningham rises, John becomes decidedly active. In the morning his animal spirits are at their highest peak. He scampers about the rooms and it needs the constant attention of Miss Cunningham and her two companions to keep him out of mischief. These two companions are her nephew, Mr. Penny, and an English friend, Mrs. Baines. Mr. Penny and Mrs. Baines volunteered to become members of the party, knowing that it was necessary for John to be watched every minute of the day, and also knowing by experience that it was impossible to hire a "nurse" for him. On several occasions Miss Cunningham has tried to engage a man who would relieve her of some of the care of John Daniel, but John Daniel immediately showed such resentment that the "nurse" had to be discharged. As a whole he dislikes men, Mr. Penny being one of the few he favors with his personal regard. This is probably due to the fact that he remembers that he was captured by men, and held captive by them until Miss Cunningham arrived in Africa to start his civilization. Women, all women, are favored with his affection, and he is fond of children. As with a human he has his personal likes and dislikes, and if after a close scrutiny he decides that he really likes a woman or a child he offers them his closest attention, sitting on their lap, or the arm of the chair, touching their faces, putting his arm about them, and sometimes attempting to offer a kiss.

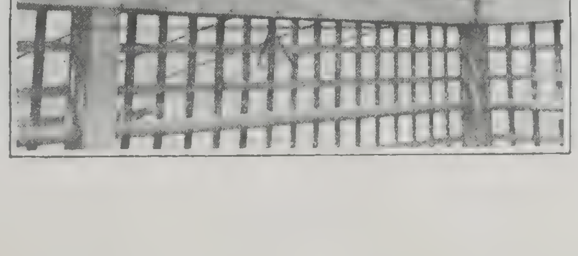
Like a normal child, John has his bath every morning. He watches the preparation of the water with grave interest, and then when it is ready he jumps in unassisted. He is very fond of water, and it is often with difficulty that he is persuaded to leave the tub and be dried and combed. His coat, of course, does not resemble the coat of a gorilla in the jungle, it is much finer, and has a satin sheen that has been arrived at because of much grooming.

Since his arrival at the Hotel McAlpin, John Daniel has paid a great deal of attention to the section of the city that can be seen from his hotel window. He loves to look out of the window, and whenever he is taken to a strange room he immediately makes for the window to get the new view.

"No, John has no idea of speech," Miss Cunningham said when asked if the gorilla had shown any inclination in that direction. "He has a series of sounds. He chuckles when he is tickled, and he has a whine, or a low wail, to use when he is feeling ill, or his feelings have been hurt. When he is angry he growls, a low threatening note. He has another note, higher, and approaching the chuckle, which means that he approves, and when he is bored he yawns to show that the time, the place, and the company are not at all interesting. Perhaps the most characteristic sound of all is the one he utters when he sits up and slaps himself on the chest with both hands. Personally I feel that when he does

(*Concluded on page 14*)

John Daniel II and Miss Alyce Cunningham. Note the gorilla's hands, feet and intelligent expression as he watches the preparations of the photographer.



John Daniel II still retains some of his jungle spirits. The trellis of the hotel roof garden looked inviting—so he climbed.

Crashing Through the U. S. Immigration Gates

More Than 20,000 Orientals Pass "Legally" Into the United States During Each Year; How Is It Done? Here's the Answer

By HARRY H. DUNN

Photo by International Newsreel

> TEN THOUSAND CHINESE and more than 9,000 Japanese enter this country every year, in spite of the Chinese Exclusion Act on the one hand and the so-called "Gentleman's Agreement" with Japan on the other. In the nine months of the present fiscal year, beginning July 1, 1923, and ending March 31, 1924, exactly 5,035 Chinese came into the United States through the one port of San Francisco alone. In the twelve months of the calendar year, 1923, there came through all American ports, 8,941 Japanese. In some years since the "Gentleman's Agreement" was signed, as high as 12,000 Japanese have entered this country legally. These figures do not take into account the Orientals smuggled into the country, but only those legally passed through our immigration stations.
>
> In the face of American attempts to keep out these Asiatics, how do they get in? This story is the answer to that question.

ASIATIC exclusion laws do not exclude Asiatics from America. Without reference to proposed changes in the immigration laws, or to percentages of previous years, quotas or classes, there is a very interesting lesson for all Americans in the manner in which Chinese and Japanese pass through the loopholes of the law into this country. Every year there enters through the various ports of the United States—largely on the Pacific Coast—a number of adult men and women of these two nationalities equivalent to the population of the average American city. They come in openly and boldly, within the law, and this known number does not take any account of those smuggled in along the Mexican and Canadian borders, or landed from small vessels at lonely spots along the Washington, Oregon and California shore.

The Chinese coming in are almost entirely men. The great majority of the Chinese women under forty years of age in this country were born here. The Japanese coming in are largely women, brought here as "Kankadon Brides," or by other less honest means, with the *avowed* purpose of increasing the native-born Japanese population of this country. Combined, the immigrants from both countries, who pass through our law, total more than 20,000 a year. Strange as it may seem, they are almost evenly divided as to numbers. Immigration officials estimate that 10.000 Chinese enter the United States each year, most of them remaining here permanently. Through the immigration station at Angel Island, on San Francisco Bay, in the nine months of the fiscal year of 1923-24 which ended with March 31, this year, 5,035 Chinese passed in. In the calendar year of 1923, Japanese to the number of 8,941 came to this country with passports from the Tokio government, and were admitted. Rather more than 6.000 of these were women.

What is of interest to Americans is how 20,000 supposedly excluded Asiatics can enter this country every year, and remain here, within the law.

The treaty of 1882 between the United States and China prohibits the migration to the United States of all Chinese except government representatives, travelers, teachers, students and merchants, with their wives and children. The obvious intent of this treaty was and is to prevent the coming to America of Chinese laborers. Those Chinese who fall into the privileged classes, first must get a certificate from the Chinese Department of State, declaring them to belong to one of these classes, and to be of such character as to entitle them to the courtesies of a friendly nation. Thereafter, this certificate must be viséed by the United States consul located at a point in China nearest to the home of the would-be visitor to this country. Even then, so equipped with certificate and consular visé, the Chinese may be held up and turned back at any American immigration station, if the officials of that station hold that the Chinese is not of good character, has a contagious disease, or is traveling under false description, name or business. A great many Chinese, probably one-third of those who try thus legally to enter this country, are turned back from our immigration stations.

With the Japanese, conditions are somewhat different. Under the mysterious and almost secret "Gentleman's Agreement," the contents of which were revealed to the people of the United States for the first time during the recent debates on the new immigration bill in the national Congress, any Japanese provided with a passport from the Japanese Government is admitted to this country, unless he is afflicted with a contagious disease, or is "known to be of bad moral character." The "Gentleman's Agreement" binds the Japanese Government to issue passports only to certain classes and to persons of good character within those classes, while, without saying so in so many words, it also binds the United States to admit all Japanese equipped with such passports. There is no check on these passports through the offices of American consuls in Japan, as there is on the Chinese.

The working of this agreement has been such that whereas in 1880 there were no Japanese in California, today there are 120 000, or more, this number steadily increasing through their high birth rate and the addition of those admitted to the country through this compact.

In the first year that the "Gentleman's Agreement" was in force, 2,432 Japanese entered in the United States.

In 1923, more than four times as many came in, or 8.941, while there were years in between in which from 9,000 to 12,000 Japanese were admitted.

In Hawaii there are four times as many Japanese as there are Chinese, Hawaiians, Portuguese or white people.

In 1923, approximately 4.400 "Kankadon Brides"—Japanese women married either to Japanese who returned to Japan from the United States to get them, or married to Japanese in the United States by "proxy" weddings in Japan—entered the United States through the ports of the three Pacific Coast states. In one week of April, 1924, two trans-Pacific steamers brought 704 Japanese, largely women, to San Francisco alone, while a third steamer two days later, added 207 more to this number.

Japanese men come to the United States, get a foothold in business of one kind or another, such as the grocery trade, there being 500 Japanese grocers in Los Angeles alone, or the vegetable trade, in which 1,100 Japanese are engaged in the same city, with the definite plan of remaining here. As soon as they become fixed as residents of this country, they return to Japan to bring back a wife. This they are allowed to do under the "Gentleman's Agreement." This means a Japanese family on American soil, with the virtual certainty of a large brood of American-born Japanese children, who are American citizens. If a Japanese dies in America before he has time to return to Japan for a wife, his registration certificate is passed on to another Japanese who is smuggled in from the Mexican or Canadian borders. Oftentimes one certificate will serve for several Japanese, who, as they become residents of this country, take turns in going back to Japan to obtain wives. The Japanese woman whose husband dies in this country is never allowed to remain a widow. She is married again just as quickly as an accommodating Japanese man can be found. Difficulty of identification of the individual Japanese is the foundation of all these forms of trickery.

In giving passports, the Japanese Government is very particular that only healthy male Japanese receive them. Since, under the "Gentleman's Agreement," laborers cannot be given these passports, such laborers are always classified as "merchants," "students," or "capitalists," the latter being provided with two or three thousand dollars in American money, which is immediately returned to the lender, as soon as the immigrant passes through the American gate. An immigration official, well known to the writer, estimates that, during the past year, no less than 2,000 Japanese have entered this country as "merchants," claiming connection with small firms, the majority of which barely support one man, far from several. Beyond these conditions, it is almost impossible for the immigration authorities to question a passport, regularly made out by the government of a friendly nation, which has made a "Gentleman's Agreement" not to send any laborers or any undesirable characters into the United States.

With the Chinese, there is no "Gentleman's Agreement," yet an even larger number of them are permitted to come in, or at least, get in, than of the Japanese. During the nine months mentioned—from July 1, 1923, to March 31, 1924, Chinese in the following numbers and classes were admitted to the United States through the port of San Francisco alone:

United States citizens, naturalized before the passage of the Exclusion Act	1,841
*Wives of United States citizens	182
Returning laborers	252
Returning merchants	539
Other merchants	62
Members of merchants' families	564
Students	167
Travelers	9
Teachers	13
Officials	107
Miscellaneous	25
Transit in bond to Cuba, all laborers	1,274
Total	5,035

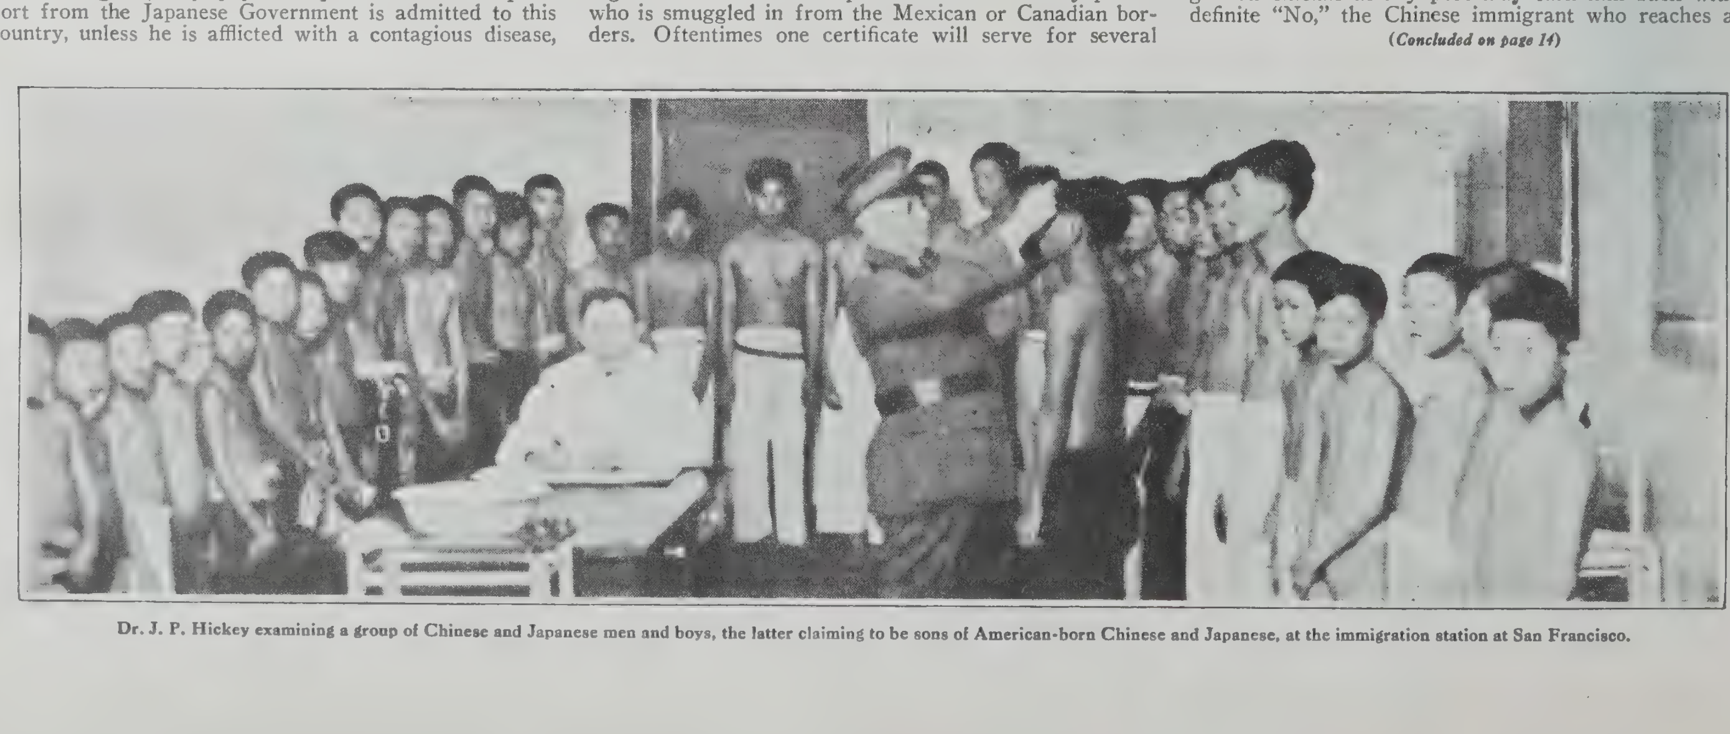
---

*Note the small number of Chinese women coming compared with the Japanese women entering the United States in 1923.

Three-fourths of all the aliens who come into the United States through San Francisco are Orientals, either Chinese or Japanese, and the same figures hold approximately true for Seattle, while at Portland the percentage is about sixty, and at San Pedro, the port for Los Angeles, about one-half are Orientals.

While the Chinese has no agreement between his government and that of the United States with which to cut a hole through American laws, and though the immigration officials at any port may turn him back with a definite "No," the Chinese immigrant who reaches any

(*Concluded on page 14*)



Dr. J. P. Hickey examining a group of Chinese and Japanese men and boys, the latter claiming to be sons of American-born Chinese and Japanese, at the immigration station at San Francisco.

Peter Cooper in "Coin and Paper Currency"

MR. CHASE, Secretary of the Treasury, was determined that no paper should be issued, without promise to pay gold and silver on demand. Mr. Silas M. Stilwell, who was the confidential adviser of Mr. Chase, labored for many days to show how interest could be used as a floating power for Treasury Notes with the Legal Tender principle as a forcing power, which would float an amount of Treasury Notes that would meet all the expenses of the war. Mr. Chase remained unconvinced and Mr. Stilwell informed me that he had but just got to his home in New York when he received a telegram, begging him to come immediately back to Washington as Mr. Chase had learned that the banks had all failed to pay specie as they had promised. On the urgent request of Mr. Chase, Mr. Stilwell wrote out his plan for the issue of Treasury notes on the principle Jefferson had declared was the only one on which the government could rely for loans. Jefferson's exact words were: "Treasury Notes, bottomed on taxes, bearing or not bearing interest, is the only fund on which the government can rely for loans and it is an abundant one for every necessary purpose.". . . . . "Bank paper must be suppressed and the circulating medium must be restored to the nation to whom it properly belongs."

Mr. Chase was compelled by the overwhelming powers of a terrible war finally to consent to adopt the plan written out by Mr. Stilwell and he says: "I was forced to cut up small pieces of paper to circulate as money, based on the credit of the people whose property it was intended to represent." That paper .was real fiat money, with the stamp of the government on it, declaring its first issues as a full Legal Tender in payment of all debts, public and private; and at the option of its owner convertible into a bond, bearing five and six per cent for the amount so converted. There has been no day since when that money was not worth as much as gold."

On the threshold of a great civil war, which threatened the very existence of the nation, the capitalists of this country and of foreign countries were unwilling, or unable, to supply the wants of the government for money on a specie basis. THEY OFFERED THEIR CREDIT ONLY, WITHOUT SPECIE REDEMPTION. It was then that Secretary Chase recognized the fact that the credit of a government, such as ours, was worth more than that of all the banks of the country united to that of all the capitalists in Europe. Mr. Chase "cut up the credit of the country into small pieces of paper" and more than two billions of legal tender found its way into the hands of the people.

When Franklin was brought before the British Parliament and questioned as to the cause of the wonderful prosperity of the Colonies he plainly stated that the cause was the convenience they found in exchanging their various forms of labor by the paper money which had been adopted; and that this paper money was not only used in the payment of taxes but in addition it had been declared legal tender. It rose two and three per cent above the par of gold and silver as everybody preferred its use. One of its advantages was its security against theft as it could be easily carried and hidden, on account of its having no bulk, as all kinds of specie have. After Franklin had explained this to the British Government as the real cause of prosperity, Parliament immediately passed laws forbidding the payment of taxes in that money. This produced such great inconvenience and misery among the people that it was the principal cause of the Revolution. A far greater reason for a general uprising than the Tea and Stamp Act was the taking away of the paper money.

Marie Corelli's Shattered Romance

A WRITER in *The Scotsman* discloses an incident and a romance in the early life of Marie Corelli. They were related by a parish schoolmaster near Oban.

Professor Blackie, Dr. Mackay, Hill Burton, the historian, and Dr. Stewart, Nether Lochaber, were members of a literary coterie with whom the schoolmaster was *persona grata.* At a luncheon at Dr. Mackay's house, Minnie Mackay (Marie Corelli, and the adopted daughter of Dr. Mackay), then a pretty, fair-haired girl of eighteen, recited some poetry of her own composition, with which the company, especially Professor Blackie, were delighted. The professor turned to her and said it was a great shame that a pretty Highland girl should not know Gaelic, and gallantly offered to give her lessons free.

"Yes, that will be very nice," said Dr. Mackay jocularly, "but Minnie is a proud and independent girl and will wish to do something for you in return. She will teach you how to write poetry."

It was an awkward moment, for Blackie was quite proud of his poetic talents. His face flushed, his brows knit, and Hill Burton's tact alone saved the situation.

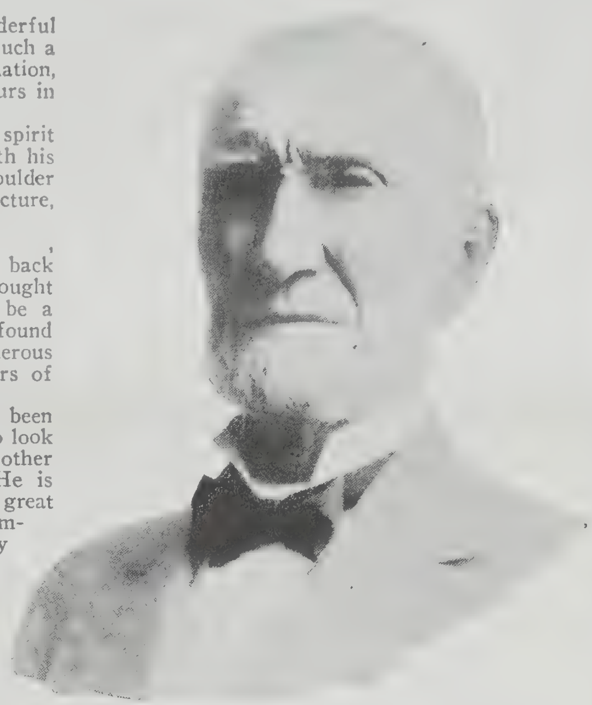
About the same time Minnie Mackay formed an attachment for a young man not quite in the same social circle, and late on a Saturday night they arrived at the schoolmaster's house to "put in the cries" for the wedding.

But, alas! he was away from home, a precious week was lost, and Dr. Mackay got scent of what was in the wind. Minnie was whisked off; and on the same steamer by which she left was the delinquent schoolmaster, whose absence had caused her romance to be nipped in the bud. She wrote a farewell lyric on the flyleaf of the book she was reading, and intrusted it to him for her lover. It reached him, and some years after he married.

Uncle Joe Cannon's Memories

Went to Hear Lincoln—Douglas Debate

By WILLIAM L. STIDGER



(C) Press Illustrating Service

A new photograph of UNCLE JOE CANNON without the cigar.

"UNCLE JOE, it must be a wonderful thing for you to know that after such a long period of service for your nation, you retire with the affection of the people yours in a very real sense!"

Uncle Joe, aged eighty-four but with the spirit of youth still strong in him, startled me with his answer. He threw his arm around my shoulder as we sat in the pew of a church, after my lecture, and said:

"Why are you handing me that bunk?"

To say the least, Uncle Joe didn't come back with the answer that I expected. At first I thought from that answer that he was getting to be a cynic in his old age. But I was mistaken. I found that he had mellowed to a sweet-spirited, generous old man, who is basking in the sunset years of life with a great peace on his soul.

Uncle Joe, more than any man who has been in public life during this generation, seems to look more like our symbolic Uncle Sam than any other public servant. He is tall and slender. He is genuinely American to the core, raised in the great Illinois and Indiana country, with a career similar to that of Lincoln, influenced largely by the spirit of Lincoln.

I went to Danville to lecture for the First Methodist Church and the pastor informed me that Uncle Joe has been attending church regularly since he came back from Washington and that he is a reverent worshiper. He also informed me that the former long-time Speaker of the House of Representatives would likely attend my lecture.

He was there, a very attentive and appreciative listener, and after the lecture, for an hour, gave me a most fascinating interview. I had spoken of Lincoln in my lecture and this started Uncle Joe's memory wheels.

"I remember Lincoln as though it were yesterday," he said. as he sat with his arm across my shoulder. "They were holding one of the Lincoln-Douglas debates which have since become famous in history. I wanted to hear that debate more than anything that I ever remember wanting in my life.

"I was a young lawyer, just starting in to practice, and I was so poor that I didn't eat very often. The debate was held at Charleston and I was practicing in Shelbyville. I wanted to hear how those two brilliant fellows handled a debate, for Lincoln was already attracting great attention. He was even then becoming a tradition.

"I went down to the depot to see the crowd off that was going from Shelbyville to Charleston. I must have had a wistful look in my eyes, for a well-known lawyer in the town who did the railroad's work came up to me and said, 'See here, Cannon, aren't you going over to hear the debate?'

"'No!' I replied.

"'Why not?' he queried.

"'Because it's too far to walk.' I said with a lump in my throat.

"'You bet your life you are going to hear that debate. Come on with me. I'll get you a pass.'"

Then Uncle Joe added, with a twinkle in his eyes, "And that rascal of a lawyer was a big Democrat at that."

Uncle Joe had as hard a time as Lincoln in his early law practicing days and he finally decided that he could never make much of a living in Shelbyville and resolved to move to Tuscola, Illinois, in Douglas County, which was a distance of about seventy miles. There was just one problem in the way of moving; he had no money. He smiled as he told me this.

"So I just gathered up my entire belongings, put them into a bag, and walked that seventy miles to Tuscola to start my practice all over again."

"Tell me about your first political campaign," I suggested.

He was in a reminiscent mood and chuckled as he started off on this story of his first political campaign; this old political warrior who has passed through more heated political scraps, perhaps, than any other man in American public life.

"I spent just five dollars in that campaign. That was all I had."

"What were you running for?" I asked him.

"Prosecuting attorney. A Methodist preacher urged me to make the run. He said they needed me to look after things in the office. They had had a bad run of officials and this Methodist preacher urged me to get into politics. That was my first thought of a political career.

"I told him that I didn't have any money to conduct a campaign.

"He proposed: 'I've got an old horse that we can drive but I have no buggy.'

"'That's all right,' said I, 'I have an old buggy that we can hitch your mare to, but how will we live while we're campaigning through the country?'

"'We'll live off the people,' calmly replied this Methodist preacher. He knew the tricks, you see," and Uncle Joe chuckled.

"We worked it all right, and for ten weeks we went about the country campaigning. Sometimes a Republican would take us home and sometimes a Democrat would entertain us, but that campaign just cost me five dollars and I was elected hands down."

Uncle Joe told me about being raised in a Quaker church. In that church in the old days when a man married a girl outside the church he was supposed to apologize to the church and tell them that he was sorry, before he would be permitted to continue as a member. Uncle Joe married a girl who was not a Quaker.

A committee from his church waited to receive his apology. They had their say, and then waited for Uncle Joe to tell them that he was sorry he had married.

"I told them that if they would come around in two years I might be willing to say that I was sorry, but having only been married two weeks, I didn't feel a bit sorry." He laughed aloud at this memory of youth.

In speaking of Roosevelt, Uncle Joe commented. "Roosevelt was a brave man, a very brave man. Of course he flew a kite once. but he was a brave man. I liked him and worked with him—except that time when he flew his kite and then I was not with him."

I talked with an intimate friend of the family and he told me a most beautiful story of a recent incident that happened in Uncle Joe's home.

An old, lifelong friend was visiting in the home. Just before dinner she said to Uncle Joe. "Mr. Cannon, would you think it amiss if a lifelong friend asked for permission to say divine grace in your home at this meal?"

"No! no! Certainly not!" and Uncle Joe bowed his head. When it was over, the tears rolled down this old warrior's face and he turned with a fervent: "Thank you! Thank you! Thank you so much!"

His is a peaceful sunset to half a century of service to his nation. He is spending the last beautiful years of his life where he has lived most of his days, down in the Lincoln land. In Danville he passes every day the fine post office building. All over his little city he sees the monuments of his political genius. Uncle Joe was always a great one to get things for his constituency. He bore that reputation and his constituency is still grateful to him, so these latter days he is basking in that fraternal affection in which his home town holds him.

Uncle Joe has made Danville stand out on the map. In this case, one man has made a town famous the country over. Danville admits this, for it has no other claim to fame. It is a little, sleepy town on the Wabash. It is quiet and uninteresting to an outsider, save for the fact that that interesting and dramatic figure still lives there.

"Smoking? No, I don't smoke much any more. I never did smoke a lot. I just kept that old stogy in my mouth. It got to be a sort of a trademark. I used to light a hundred matches to one cigar. I never did smoke much and little now. I still chew at an old cigar, but that's all."

Everybody in Danville is proud of Uncle Joe and Uncle Joe is proud of Danville, while the nation looks on with beneficent love, as the sun sets and the evening shadows gather around this old giant's head.

When Grafters "Bought" Two Great States

Most Picturesque Public Scandal in This Country and No One Punished

By AARON HARDY ULM

> The biggest public scandal in our history?
>
> No; it isn't that having to do with oil leases, nor any other current or recent event.
>
> It began almost with the organization of government. The last official record relating to it was written more than seventy-five years later, within the memory of men still active.
>
> Involved in it were some of the biggest public figures in the country, several of whom are ranked by history with the great. The scandal had to do with an attempt to procure by bribery and fraud an area of land now comprising the territory of two big states.

ONCE, when turning the leaves of an old record book in the archives of the state of Georgia, the writer came upon several pages whose original entries were run through with heavy lines of ink.

Clearly, the marring was no wanton act. The lines drawn through the original writing were solemnly certificated on the margins.

Search was made for the explanation. This led to an examination of the original records relating to one of the most dramatic incidents in American history—an incident involving shame, disgrace, even tragedy, together with extraordinary displays of public and private honor, even heroism.

This incident is known to history, which now passes it by with only casual notice, as the Yazoo Fraud, the word "Yazoo" coming from the river which flows along the northern border of the state of Mississippi into the Mississippi River.

The incident occupied a leading place in public discussion for nearly a quarter of a century. It led to important legislative reforms. One is the requirement, now made by most state constitutions, that every intent and purpose of a legislative act shall be mentioned in its caption. The Federal Constitution does not require this, with the result that much vague and harmful legislation has slipped through Congress in the form of riders or jokers.

Real Estate Dealers on a Large Scale

THE sequel to the Yazoo Fraud accounts largely for the infrequency of similar scandals since its time. Nothing was ever so clearly demonstrated as the fact that those who attempt such things have little chance of escaping terrible public wrath. The good effect might have been greater but for the fact that in the end the fraud was held to have been "legal" and those who had lost money risked upon it were indemnified—a curious case of an atrociously corrupt proceeding being upheld by the highest court in the land and by Congress.

The Yazoo Fraud was a product of the land speculation craze which swept the country following the Revolutionary War and has never quite subsided.

Land speculators, among whom were men like George Washington, dealt in areas beyond the wildest dreams of present-day realtors. Land was plentiful and cheap. Sections now thickly settled were then occupied only by scattered bands of Indians and buffalo. Most of the unsettled land was owned originally by the states. There was no fixed policy governing the handling of these big unsettled areas. Tens of thousands of acres were sold to individuals for from one to a few cents an acre. George Washington himself acquired in what is now Ohio a tract that today is worth a hundred million dollars or more. His heirs lost it through failure to keep up the tax payments!

When the Revolution closed, the boundaries of the state of Georgia extended to the Mississippi, including areas now in the states of Alabama and Mississippi. The hundred thousand square miles or more beyond the Chattahoochee and Alabama rivers were almost wholly unsettled, and this area was known as Georgia's western territory.

An adventurer known as Major Thomas Washington (his real name was Walsh) conceived the idea of bringing that vast area within the bounds of a private land-selling operation. But Walsh soon passed out of the picture, being hanged for counterfeiting at Charleston, South Carolina.

The scheme which he initiated was taken up by persons of greater respectability, among them being the great Patrick Henry, of Virginia, "peculiarly the judge of the value and quality of land" as well as of freedom. But Patrick Henry seems to have dropped out before the movement took on aspects of gross corruption.

35,000,000 Acres—$200,000

ORIGINALLY four land companies were formed with the view of developing the area. These companies—so far as indicated, by honorable means—induced the Georgia legislature in 1789 to make contracts engaging to sell to them tracts of land aggregating about 35,000,000 acres for approximately $200,000—a very large sum of money in those days.

Nothing came of this venture, except rather grandiose negotiations. Three of the companies appear to have made no attempt to go forward with the deal. The third one, managed largely by a Dr. James O'Fallon, who became a brother-in-law of the famous George Rogers Clark, pursued a course of high intrigue in an effort to make good on the venture.

This intrigue went so far as to contemplate the establishment of a corporation-managed independent state conducted somewhat as areas were then governed by British trading companies. An army, which was to be commanded by George Rogers Clark, was organized—on paper. The Spanish governor of the then Spanish-owned Louisiana Territory was approached with a proposal that this state be made a dependency of Spain.

This was done because Spain, which still possessed Florida as well as the Louisiana Territory, claimed the territory.

The Spanish governor doubted the advisability of "taking a foreign state to board" and evidently did not give high approval to the proposal when submitting it to Madrid for consideration.

Spain's claims clouded the titles which Georgia contracted to sell. South Carolina also claimed the area as a part of that state's original grant. The Federal Government likewise claimed it as a national possession. Largely because of these conflicting claims, the first attempt to exploit the area failed.

There was another cause: George Washington's firm opposition to the undertaking.

When news of the sale reached the Federal capital, then at Philadelphia, Washington, who was serving his first term as President, denounced it as "of exceeding magnitude which might in its consequences seriously affect the peace and welfare of the United States." He did not hesitate to say that if necessary he would use Federal troops in protecting the rights of the Indians, whose claims to much of the area antedated all others.

The buying companies failing to make payments within the time allowed for them, the contracts expired by default.

The scheme was renewed in 1795. In its new form it was promoted largely by persons who had no hand in the first venture, although many who participated in the first shared in the second.

Involved in the second scheme were several persons of high prestige.

The chief leader was James Gunn, United States Senator from Georgia. His position enabled him to keep informed as to steps taken to clear Georgia's title to the area. These consisted chiefly of a treaty arrangement with Spain whereby that country surrendered its claims. South Carolina did likewise.

A Judge Buys a Million Acres

GUNN anticipated these developments by quietly organizing a private movement aimed at acquiring and exploiting for profit the large territory. He got many members of Congress to take shares in the venture. James Wilson, a justice on the United States Supreme Court, accepted shares approximating about one million acres of land. Other men of national prominence, among them Albert Gallatin, A. J. Dallas, John Sevier, Jared Ingersoll, Robert Morris and Wade Hampton, accepted shares in the enterprise.

Three land companies were formed. In December, 1795, the Georgia legislature enacted a bill providing for the sale to these companies of practically all the area now within the states of Alabama and Mississippi. The sale price was $500,000, or approximately one and a half cents an acre.

The enactment was in the form of a rider put upon a harmless-looking measure pretending "to provide releif" for the state's veterans of the Revolution. In its caption there was no mention of land, nor of the sale of public property. General George Matthews, perhaps an honest but evidently a stupid man, was governor and vetoed the measure.

His was the first use in Georgia, and one of the first in the country, of the veto power. This feature of government had been taken from the British Constitution. The veto already was obsolete in Great Britain.

A mighty furor was raised concerning Matthews' "tyrannical" act. He even was threatened with impeachment, for arraying his will against that of the people's legislative representatives. In the rumpus, the inner facts in the bill which he had vetoed were ignored.

In January, 1796, the legislature again passed the bill, in slightly modified form. Governor Matthews then approved it.

When news of the bill's contents reached the national capital, President Washington again denounced the undertaking.

The venture, however, probably would have gone through as planned but for the intrepid opposition of a single man. This was James Jackson, junior United States Senator from Georgia.

Jackson was a quaint individual. An aristocrat, well-to-do, he migrated to Georgia when a youth, joined the Revolution and rose to a general's command while still in his twenties. Immediately after the war he was elected by the legislature as governor of the state. He refused the office on the ground that no one so young as he should be intrusted with so great a responsibility—the only case of a renunciation of the kind of which this writer is aware. Later he went to the United States House of Representatives and then to the Senate.

When he learned of the legislative act selling for a pittance a small empire, he did another extraordinary act, in-so-far as the writer knows an act without precedent before or since in the history of this country. He resigned from the United States Senate and announced himself as a candidate for the Georgia legislature on a platform demanding that the act of sale be revoked as of fraudulent character.

Jackson's Fight to Undo the Fraud

A MAGNIFICENT gesture of that kind was needed, for the reason that leadership in Georgia, as well as in large measure elsewhere, had been corrupted by the agencies which brought about the sale.

The schemers had silenced virtually everyone of influence who could be reached—and it seems that most of them in Georgia had been reached. Later it was demonstrated that every member but one who voted for the bill had been bribed—most of them with portions of the land which they sold. But of that more will be put forth in another article. Prominent lawyers, business men, editors and politicians out of office likewise had been silenced. Jackson himself was offered a bribe, but refused it.

Casting caution to the winds he assumed leadership of the fight to undo the fraud. Most people of his class were on the other side; he directed his appeal to the masses. He didn't hesitate to make his attack personal, with the result that he was involved in several duels. Dueling appears to have been his favorite sport. During his life he engaged in more than a score of affairs of honor, and in the last one, which grew out of a quarrel having to do with his opposition to the Yazoo affair, he received wounds from which he died.

Incidentally, this country's public life has known few more picturesque figures than that of James Jackson, the heroic Georgian. Yet for some reason no biography of him has ever been written. General histories mention him only casually, in connection usually with nothing more than the Yazoo Fraud which is mentioned only a little less casually.

He won the great fight of his life, as shown by those lines drawn through many pages of old official records in the governor's and secretary of state's offices in Atlanta.

He caused every state record having to do with the achievement of the fraud to be obliterated or destroyed.

The records, however, still disclose the bizarre and disgraceful facts which he chiefly caused to be exposed. These are reminiscent of some current happenings, and may throw some light on the probable outcome of these happenings. In another article the main ones will be reviewed.

This is the first of two articles, the second will appear in an early issue.

Are Advertisers Killing New York Newspapers?

Concluded from page 2

000 persons. Somehow, only the morning papers are regarded here as of any particular informative value.

In the afternoon field we have the *Sun* and the *Telegram-Mail* (Munsey's), the *Journal* (Hearst's), the *World* (Pulitzer's) and the *Post*, a rather dull, semi-financial organ owned by Cyrus W. Curtis, of Philadelphia, who likewise possesses the *Saturday Evening Post*, the *Ladies Home Journal*, and the Philadelphia *Ledger*.

Not an imposing array—is it?—that of the newspapers of New York. And certainly it is one that should not be narrowed further.

On the contrary, it should be broadened. There is a wonderful opportunity, it seems to me, for an independent, fearless, daring, more-or-less truthful newspaper in New York today. I say "more-or-less truthful" because it is always a disputed question among journalists as to the possibilities of success that an entirely truthful newspaper might have. We are all pretty generally agreed that there exists no such thing today.

There seems to be no particular hope of any new and serious contender in the metropolitan journalistic field. It has been announced that an individual from Boston intends starting a new evening paper here, but that seems doubtful. The paper he operates in Boston is a sensational scandal-sheet, and a mate to it in New York would be of no benefit at all.

For fearless, independent utterances, shall New York be obliged to go back to the old days of pamphleteering such as England knew in the sixteenth and seventeenth centuries? That would be an interesting experience, at all events. If an individual felt that he had something to say to his fellow-citizens, he might buckle down to his typewriter, pour forth his soul, and then distribute his ideas in the form of leaflets. Then the next citizen, who disagreed with those ideas, might seat himself and pound out a reply.

This would be a relief, anyhow, from the mess of stuff we are getting about bobbed-haired bandits, society divorcees, defaulting cashiers, and what not. And —who knows?—maybe this queer big city has another Dean Swift concealed somewhere in its midst. Swift, you will recall, was one of the most adept of the old British pamphleteers.

But maybe Munsey would merge a couple of these pamphlets and "retain the best features of each!"

Mr. Ford's Page

ABROAD the label "American" is so misleading, covering any and every form of enterprise and men of every racial extraction, that foreign peoples are excusable if they form a false impression of what "American" means. But there is no excuse for us: it is our first duty to define Americanism and, if it be worth it, protect and extend it.

Americanism has no obtrusive racial tests except where racial facts tend surely to antagonize, or refuse to yield to, the American Idea. For Americanism is an Idea. The Idea was established on this soil to serve as a center for believers from all the world. Time was when those only came to our shores who came for the service of the great Idea. They were Americans in spirit. They were of that human composition which forms the best soil for the seeds of political freedom, religious liberty, equal rights and fair opportunity.

As the nation which was built around this idea took its place among the powers of the world, it began to attract quite other classes: not those who came to share and sacrifice for the Idea, but those who came to share its wealth. Among them were those who cared only for the wealth, and who thought of the idea, if at all, only with a desire to change or destroy it.

This is the one point at which race consciousness arises in America. When it becomes apparent that there are human compositions which are not soil for the seeds of liberty, the spiritual America immediately recognizes an alien and an enemy.

It is just at that point the edict is born: America is made, not to be remade or unmade, but to go on being made according to the original pattern of a land and a government for all peoples capable of receiving liberty.

It is only at this point that any American law is laid down. And even this was not done until the strength of alienism (not racial but spiritual) began to be felt destructively in our life.

The difficulty seems to have arisen through our later immigration coming to a source of wealth instead of to an Idea. What has been preached abroad to attract immigrants these last twenty-five years has not been liberty but license, not high citizenship but high wages. Our best people from overseas came for citizenship first, and it was their character which helped to develop the country industrially and pay high wages.

It was once true that immigrants to America were the "extract of the peoples," the best and most enterprising individuals and families, not rich but honest, not greedy but ambitious, not highly skilled but industrious—these in their hundreds of thousands were born candidates for Americanism. They were adventurous offspring of the same spirit that brought the first Americans over—the first seekers after conditions which would preserve and secure mankind's inalienable rights.

Is it true any longer? In individual instances, undoubtedly so, but in the mass—no. For many years the hosts that came to America have been recruited by those who profit in the transportation of great numbers, and by poverty-stricken governments who were glad to finance the departure of those classes of the population from which the largest number of incompetents and public charges came.

Those were great days when the people came with a desire to share America's mind and life. But duller days have followed: the American idea is hardly heard of among the vast foreign masses. If heard of, it is too often condemned. Everywhere keen minds are busy teaching newcomers that their main business here is to change Americanism into a species of Europeanism, and to undermine those very prosperity-making and prosperity-keeping institutions whose disappearance would destroy the very things in which these later newcomers are most interested.

NATIONS are great as they are prosperous, and prosperous as they are industrious and just. At bottom, prosperity depends on the national Idea. When that is uncertain, all else wavers. In those decades and generations when Americans never questioned the American Idea, the foundations of our prosperity were laid. In these decades when many influences would weaken the American Idea, prosperity has met most of its enemies. An attack on prosperity attacks the nation, and this is never so strongly effected as by an attack on the national Idea. One safeguard of prosperity, then, is learn What America is, Why it is, and whether we desire the American Idea to continue and expand in the world. That alone makes an American, and is the root of American security and prosperity.

There are many who find it easy to denounce the intention of newcomers to change the American idea. There are many to swear that it shall not be done. But it would be more useful just now if some one would show us just how far we have been swerved from that Idea which alone made our nation possible.

What we need just now is common sense enough to see that if newcomers have changed the ideas of Americans, the fault is not with the newcomers but with the Americans. If we have been changed in any way for the worse, there is no one to blame but ourselves. If moral Americanism has proved to be weaker than moral Europeanism, then to the victor belong the spoils. But contradiction arises when we say that moral Americanism is stronger and more enduring than the other, and yet complain that the other is bearing off the victory.

If there is any complaint to be made it should not be directed anywhere but at ourselves. To speak of even our vast immigration as an excuse for the changing countenance of the country is simply to conceal from ourselves our own neglect of duty. Why, the American principle is so little spoken of today that when someone goes back to foundation truths he is received as a new oracle. The principles of the first patterners of the American system are as fresh and as sparkling as if they were newly formed yesterday. Amid all the writing now done on efficiency and freedom in politics none is more modern than Jefferson, while on success topics and business philosophy, there is none to compare with the soundness and vitality of Benjamin Franklin.

There is need of a new knowledge of the foundations of our national life, for it is still a thrilling national life in spite of the fact that we have wasted the last few years considering what we call modern ideas, which prove upon examination to be ancient fallacies. Our fathers definitely met, disproved and discarded those same ideas, and had to do so, to clear room for this new nation. If every generation must do over again the work of preceding generations, progress will be slow. Progress in America has been rapid because we have had three or four generations that kept the good and forgot the bad of their predecessors. Whether we are now undergoing a throw-back need not be discussed. It may be said emphatically, however, that we need not hesitate in our progress unless we wish to.

But it may be suggestive to students of our life to note that hesitancy in our progress comes just at the time when there is less than usual definiteness about the general conception of what Americanism means. In a special sense does American prosperity depend upon the Americanism of our psychology. The shining characteristic of American psychology is its release of human energy, through the agencies of hope, security, freedom and equality of rights. What Americanism has done is to liberate what is progressive in man. What the new libertarianism wants to do now is to liberate or license all that is retrogressive and evil in man. Well, at that point the American type of liberty stops, and we might as well be very staunch in our assertion of the fact.

It would be sheer gain if we interested Americans in the principles of American life. In the things that can be taught to the mind, many aliens are better instructed than the average American. But that does not necessarily make the American. However, lack of it may tend to unmake an American. And perhaps that is where most of the trouble has crept in—Americans do not know the what, the why and the wherefore of this great human experience, this great human trust, created for and given to them. But of whatever race, the man who does know these things and approves them and pledges his honor to them, he is an American.

A volume of 452 pages, durably bound, containing 98 of these articles under the title of "Ford Ideals," will be sent postpaid for $1.00.

Business Is Good

BUSINESS is good. If it is possible for anything to be too good, perhaps it has been true of business. There has been such constant pressure on production, such large areas of need to be filled, that the country has been going at a greater pace than it has recognized. All records have been exceeded. We have gone further in advance of our most busy and prosperous periods than we can realize. A considerable falling off in immediate pressure could occur and still leave conditions in the country much better than they have been at any time since the war. The main danger is, as always, psychological. That means, the creation of fear and uncertainty. People are always slow to learn that breathing spells in business are perfectly natural, that the progress is always upward even though the actual climbing may halt for a moment.

So that while business is undoubtedly good, so good that nothing natural can stop it, it is folly to assume that every ounce of pressure must be kept on every moment to maintain sound conditions in business. Not at all. It is as necessary intelligently to interpret slight breathing spells, as it is to interpret forward movements. It is absolute misinterpretation to call a "breather" a slump or the forewarning of slackness. The basis of our business is sound, and the basis remains.

The Straw Vote Fallacy

THE attempt to measure popular opinion by the straw vote has proved to be not only a failure, but even a deception. It has been a pretense of securing valuable data, while very obviously the advertising value was mostly in view.

A recent case was the popular vote on the Mellon tax plan and the bonus measure. Of fifteen million ballots distributed, some two millions were returned, nearly all *favoring the Mellon scheme* and *opposing adjusted compensation.* Upon this result the magazine justified its position on both issues, which accorded with the vote cast. In the case of the ballot on the Mellon plan it was difficult for a straw voter to vote "No" to the Mellon plan without seeming to vote "No" to all proposals of tax reduction. But apparently there was an alternative to the Mellon plan, as Congress speedily found.

The bonus proposition which was "strawed under" comes galloping out ahead, making any sort of adequate tax reduction next to impossible.

So much for the value of one "popular vote."

Sense or Censor

PROBABLY most of what the objectors have to say about censorship has a grain of truth in it. Seldom does any course, taken to prevent an evil, itself escape evil. That may have been the meaning behind the saying of Christ, "Resist not evil"—the act of resistance to evil is almost certain to involve some form of it. And, as we are accustomed to say, two wrongs do not make a right.

Nevertheless in this practical world, censorship has become somewhat established. The Government censors conduct. The chemists censor adulterants and poisons. Legitimate business censors fakes. Traffic laws censor certain careless tendencies on the part of motorists. Parents censor the greed and temper of children. And as to "art," scarcely a day passes that the newspapers carry no account of some "art" party being broken up for reasons of public policy.

As to the theater, there are still young men who seek information concerning the plays to which they may invite young ladies—a sort of private censorship known in colleges, schools and many business offices.

The present proposal of censorship is with regard to the movies, and the great outcry against it centers there. The propaganda against is greater than the propaganda for, which fact in itself is significant. Opponents threaten the country with many dire results if censorship should ever be established in the sacred domain of films. But it is already established there. Every time a producer or director turns down decency in favor of pruriency, a censorship is exercised—against the decency. The mere fact of turning the face of censorship the other way would make no difference at all in the principle, while it certainly would make a difference in the results.

The whole value of censorship is in the presumption that it would lead producers to do their own censoring first. By the time the public pays its millions of admissions to see a picture and form its own opinion, the producer's purpose is served: the admissions have been paid. That is what he wants. And it would satisfy him most abundantly if that sort of thing could go on forever. It is the judgment that may be rendered without the previous expenditure that rouses his objections most.

The statement is made by the publicity men of the movies that pictures have taken a turn for the better. Maybe so. But what do they mean by "better"? As one observer puts it, the damage done by the movies is not the *demoralizing* but the *dementalizing* of its patrons. You park your mind outside with your car, and bring to the screen your eyes and your emotions. Have the movies grown better on the score of mentality? We mean the neighborhood movies, the nightly pabulum of the plain people. That some of the great pictures are enduring achievements, all will agree. These, however, are not included in the term "movies," as commonly understood.

And can censorship stop the trivializing of the pictures?

Probably not, as long as our greatest strings of newspaper, magazine and picture producers insist on treating the public as a child with a twelve-year-old mind.

Censorship could doubtless purify the movies. Could it give them mental maturity?

Freight Trains to Sea

IT REQUIRED the exigencies of war to make the English recognize the value of the American practice of taking freight trains to sea.

Now the English war train ferries have been made available for ordinary traffic. They are unwilling to discard an innovation that is an improvement. Thus it is now possible to send a carload of English goods intact to Constantinople.

Americans have long appreciated the advantages of the great ferries that transport freight cars between Key West and Havana and across the Great Lakes, and also all of the passenger and freight trains across the Mississippi at New Orleans and Vicksburg and the Overland Route across the Sacramento River. But Britain, the greatest maritime nation, was slow to realize the advantage of ferrying its freight cars over to the Continent.

During the war, doubtless inspired by their record of success in America, car ferries were established between the English warport of Richborough and Calais and Dunkirk and also between Southampton and Dieppe.

The peace-time car ferry route has been established between Harwich, northeast of London, where the Midland industrial region can also use it, and Zebrugge on the Belgian coast where lines diverge to France, Germany and Holland. The transfer slip cradles and the boats of the war routes have been used.

It is eighty-four miles between Harwich and Zebrugge and the ferries, each carrying fifty-four of the little twelve-ton European freight cars, make the trip in nine or ten hours.

Future car ferries from Hull to Scandinavia are now being discussed and enthusiasts speak of the time when the links between England and India will be built and that long route open. The Cape to Cairo route will also be open by that time.

Although the airplane will carry much of the mails and passengers of the future, the law of gravity will always operate to make the freight train a necessity. Where there is but a short water carry, it is good business to eliminate the cost of transfer from car to boat and again to car through a train ferry which preserves the low cost of water transportation without breaking bulk.

Coolidge and the Clowns

WHEN President Coolidge went to the circus he found the very clowns acting as agents of wet propaganda. The jokes against the Constitution, in its relation to liquor, were very funny, and the unthinking crowd roared. But the President of the United States sat with unmoved features. What a spectacle it would have been for a President of the United States to jeer the Constitution! But why more of a spectacle than that of citizens doing the same thing? Imagine a picture in the Berlin newspapers—"American citizens laughing at their own Constitution!" Imagine the inhabitants of Spain studying the photograph of an arena wherein a pantalooned clown was throwing multitudes into hysterics with attacks on the law! The Spaniard would thank God he lived in a land of peaceful bullfights.

There is a reason for President Coolidge not laughing.

He probably knows what intelligent citizens generally should know,

Namely,

That on the stage,

And on the Movie Screen,

As well as in the pages of the newspaper,

Propaganda for the "wets" is organized—not for the joke of it, but for the subtle, undermining effect of it.

But it is sad to see it invade that children's paradise, the Circus.

Political Buncombe

IN THE clip-sheet of one of the national political committees is found the following:

"In one of Professor Irving Fisher's latest computations the purchasing power of the average man's dollar is rated at 68.6 cents, compared with a pre-war value of 100 cents. According to Professor Fisher the dollar was worth 3.9 cents less in the week of April 25, 1924, than it was on January 1, 1922.

"During the first quarter of 1924 the dollar was worth an average of 68.4 cents, according to Professor Fisher's calculations. The dollar's average value for 1923 he fixes at 63.4 cents."

The statements are doubtless accurate as far as they go, but they do not tell the whole truth. If the returns from production and labor will buy as much at a given time as at any time before, the amount which the dollar will buy does not matter. If the wage level of 1924 is increased in the same proportion as the price level, there is no loss to the laborer. The real comparison is between the production required to secure the dollar and the commodity needed to buy the dollar.

Briefly, it is not what a dollar will buy, but what will buy a dollar.

A New Fifty-Cent Piece

A NEW coin, a fifty-cent piece, is now ready for distribution. It was struck by the United States Mint in Philadelphia in commemoration of the Huguenot-Walloon Tercentenary. The obverse bears the profiles of Admiral Coligny and William the Silent, two leaders of the Huguenot cause; the reverse pictures the ship *Niew Nederland,* in which the Walloon colonists came to America.

The first of the coins was presented to President Coolidge in the presence of a distinguished group, including Ambassador Jusserand, of France, Ambassador de Graeff, of Holland, and Ambassador de Cartier, of Belgium. In acknowledging the gift, President Coolidge declared that the observance of historical anniversaries preserved the spirit of the spiritual pioneers who gave its first character to the spirit of America. He paid special tribute to the settlers from Belgium, France and the Netherlands because of their willingness to suffer for freedom of conscience.

Another Veto

ACCOMPANYING eighty-odd bills returned to the New York legislature by Governor Smith, unapproved, was the following terse message:

"The following bills are not approved, because they are either duplicates, or unnecessary, or defectively drawn, or are embraced in or in conflict with bills already signed, or are unconstitutional, or are for purposes which can suitably be accomplished under general laws, or should be provided for, if at all, by amendment to the general law, or are objectionable or inadvisable by reason of proposed changes."

How many useless and costly statutes this judgment could kill if turned loose on the statute books and legislatures of the world.

If Thomas Jefferson Were Alive Today

Where Would the Author of the Declaration of Independence Stand on Subjects Which Now Confront Our Nation?

By FRED L. HOLMES

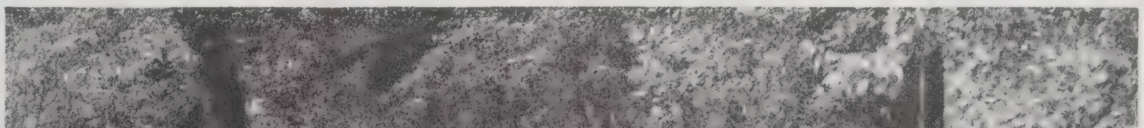
The famous Karl Bitter monument of Thomas Jefferson, which was unveiled at the University of Virginia, Charlottesville, 1915.

THOMAS JEFFERSON, like other statesmen whose philosophy and sagacity have molded the life of the nation, has his opinions often cited by later generations. Where would Jefferson stand on the important issues of today? Nationalists and internationalists; pacifists and militarists; wets and prohibitionists have claimed him.

Fortunately Jefferson held views on all these subjects, which he was not timid to express. He was an astute political philosopher who visioned problems generations ahead. He saw fundamental truths. No American has left such a mass of public and private writings as a legacy to posterity. His papers and correspondence have twice been published and his views on economic questions have been issued in an encyclopedia.

So often was he consulted by leaders after he left the Presidential chair, that he was known to the nation as the "Sage of Monticello." There is scarcely a subject within the circle of public inquiry which did not draw from him some definite expression of his ideas. The list ranged from astronomy and the science of government to the cause of weather disturbances and the care of infants. And on each he gave an opinion with a conviction of certainty. Many of the principles he enunciated are as applicable to present-day conditions and controversies as when he stated them.

Jefferson esteemed his achievements in shaping the future thought and conduct of a nation above the chronicle of his official office tenure. For sixty-one years he held public positions. This rôle was discarded when he came to write his epitaph. He directed that there be inscribed upon his monument the fact that he had written the Declaration of Independence, that he had been the author of the Virginia statute of Religious Liberty and had founded the University of Virginia. Ignoring the foothills of honor, he "saw only the mountain peaks of service."



Down the shady walk at the University of Virginia but a few miles from Monticello, Jefferson's plantation home.

What would such a leader say of the morale of men in bartering for appointive office, the debauchery of public trust, which a nation has witnessed within the past few years?

"It is not for an individual to choose his post," Jefferson wrote to President Washington. "You are to marshal us as may be best for the public good."

Then, again, as if he foresaw the recent oil scandal:

"I love to see honest and honorable men at the helm, men who will not bend their politics to their purses, nor pursue measures by which they may profit, and then profit by their measures.

"Whenever a man has cast a longing eye on offices, a rottenness begins in his conduct.

"Talents and science are sufficient motives with me in appointments to which they are fitted. They should be called to that charge without regard to wealth, birth or other accidental conditions of circumstance."

He was opposed to war; antagonistic to a large standing army; favored the training of the college youths in military science and believed that the patriotism of a nation could be depended upon to defend the country in case of an attack or invasion.

"I abhor war and view it as the greatest scourge of mankind," he wrote.

"The evils of war are great in their endurance, and have a long reckoning for ages to come."

As to a standing army he declared:

"The spirit of this country is adverse to a large military force." . . . . "One of my favorite ideas is never to keep an unnecessary soldier."

He believed, however, in compulsory militia service:

"We must train and classify the whole of our male citizens, and make military instruction a part of collegiate education. We can never be safe until this is done."

"For a people who are free, and who mean to remain so, a well-organized and armed militia is their best security."

It was his opinion that the people would rally and produce an army for their defense if needed.

"I am satisfied the good sense of the people is the strongest army our government can ever have, and that it will not fail them."

"Wars and contentions indeed fill the pages of history with more matter. But more blessed is that nation whose silent course of happiness furnishes nothing for history to say. This is what I ambition for my own country."

It must be remembered that all through colonial history the colonists were embroiled in wars, which started in the mother countries. When the independent nation was formed, the political leaders became averse to alliances with Europe. That was Washington's view. It was Jefferson's as expressed many times.

Undoubtedly he would be opposed to the League of Nations.

He said: "Determined as we are to avoid, if possible, a wasting of the energies of our people in war and destruction, we shall avoid implicating ourselves with the powers of Europe, even in pursuit of principles we mean to pursue. They have so many other interests different from ours, that we must avoid being entangled in them. We believe we can enforce these principles, as to ourselves, by peaceable means, now that we are likely to have our councils detached from foreign views."

Moreover, Jefferson was a nationalist.

Was this advice to John Taylor in 1798 meant to apply to conditions today?

"Better keep together as we are, hands off from Europe as soon as we can and from all attachments to any portions of it."

He believed that the interests of the United States should be confined to the western continent. As early as 1823 he wrote to President Monroe favoring the annexation of Cuba, but by the same argument he would have been opposed to the annexation of the Hawaiian and Philippine Islands. He said: "Cuba can be defended by us without a navy, and this develops the principle which ought to limit our views. Nothing should ever be accepted which would require a navy to defend it."

More explicitly he summed up his nationalism in a letter to President Monroe:

"Our first and fundamental maxim should be never to entangle ourselves in the broils of Europe. Our second, never to suffer Europe to intermeddle with cisatlantic affairs. America, North and South, has a set of interests distinct from those of Europe and peculiarly her own. She should therefore have a system of her own, separate and apart from that of Europe."

Were Jefferson alive today he would be a leader for many reforms. Many of the election changes which he favored are still being advocated.

He believed that "short elections will keep Congress right."

He advocated a direct vote for President:

"Have no (Presidential) electors, but let the people vote directly, and the ticket which has a plurality of the votes in any state to be considered as receiving thereby the vote of the state."

His forty years of experience with popular assemblies, he said, taught him that reforms must come gradually; that one must give the people "time for every step you take. If too hard pushed they balk, and the machine retrogrades."

He would oppose the present-day advocates of the "let-well-enough-alone" policy:

"The idea that institutions established for the use of the nation cannot be touched nor modified, even to make them answer their end, is most absurd against the nation itself."

Using a more homely expression on the adequacy of reforms, he added: "The hole and the patch should be commensurate."

He opposed neopotism. He argued that "the public will never be made on the ground of merit alone uninfluenced by the family views, nor can they ever see with approbation offices divided as family property."

He was opposed to candidates for office expending money to aid in their election.

Because it has been revealed that millions are now spent every four years in the nomination and election of the President, this is still a problem of prime importance. Jefferson asked the insertion of a provision in the Virginia constitution that "no person shall be capable of acting in any office, civil, military or ecclesiastical, who had so expended money."

Nor was he in favor of the appointment of women to office and when Gallatin planned such a policy he sent him this curt note:

"T. J. to Mr. Gallatin: The appointment of a woman to office is an innovation for which the public is not prepared, nor am I."

More than a century has made such a change in the status of women that his objections would probably now be withdrawn.

The idleness of wealthy sons he could not countenance. His philosophy was that:

"An industrious farmer occupies a more dignified place in the scale of beings, whether moral or political, than a lazy lounger, valuing himself on his family, too proud to work, and drawing out a miserable existence, by eating on that surplus of other men's labor, which is the sacred fund of the helpless poor."

When fortunes of individuals became "swollen" he believed in specific legislation that would distribute them:

"If the overgrown wealth of an individual be deemed dangerous to the state, the best corrective is the law of equal inheritance to all in equal degree; and the better, as this enforces a law of nature, while extra taxation violates it."

The daily warnings of Wall Street's pessimists would not have disturbed him: "Do not be frightened into the surrender of true principles by the alarms of the timid or the croakings of wealth against the ascendancy of the people." "Enough wealthy men will find their way into the legislature to protect themselves."

He visioned an aristocracy built on education instead of wealth: "Whenever the people are well-informed, they can be trusted with their own government."

General prosperity was to be desired and he would not have the government interfere too much with industries. He would have advocated legislation to help the farmer.

"A prosperity built on the basis of agriculture is that which is most desirable to us, because to the efforts of labor it adds the efforts of a greater proportion of soil."

"Agriculture, manufacture, commerce and navigation, the four pillars of our prosperity, are the most thriving when left most free to individual enterprise."

The rights of labor and capital he would preserve:

"The first foundations of the social compact would be broken up, were we definitely to refuse to the members the protection of their persons and property, while in their lawful pursuits."

Sentiments expressed by him show opposition to ship subsidy; advocacy of enforced economy in government, and a favoritism to building roads. He would have fought the rule of wealth as an evil in government.

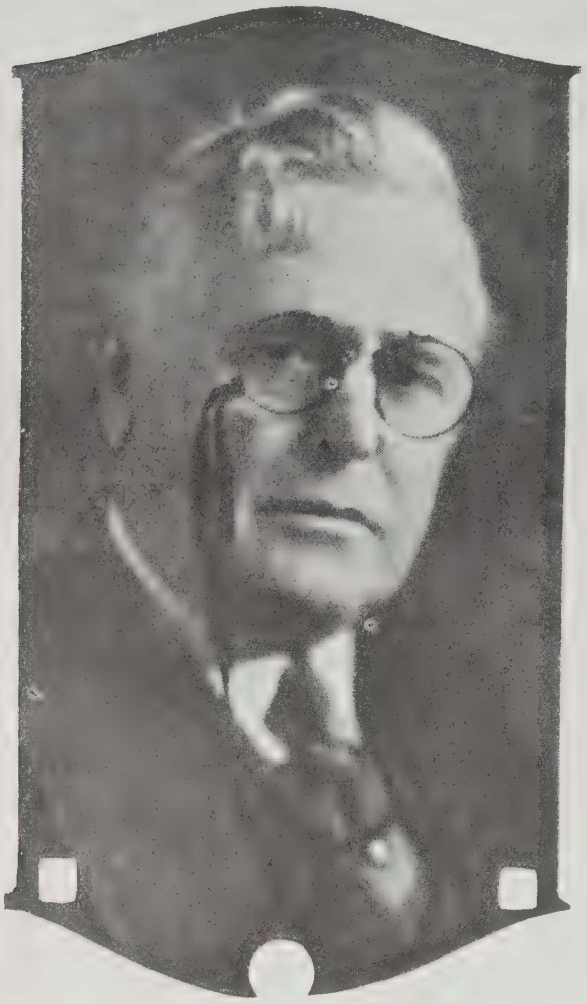
"It is essentially interesting to us to have shipping and seamen enough to carry our surplus products to market; but beyond that I do not think we are bound

(Concluded on page 15)

Strange Story of W. Clark Noble, Sculpto

American Master Who Never Studied Abroad

By GEORGE H. DACY



W. CLARK NOBLE,

One of the world's best sculptors who has developed great artistic proficiency without any foreign training.

VICTOR in ninety-eight per cent of all the national and international competitions he has entered, a bred-and-trained-in-America sculptor who is also an experienced architect, a talented wood-carver, an inventor of remarkable portrait miniature processes, a champion athlete, a professional modeler and an expert anatomist—these are a few of the qualifications of W. Clark Noble, who ranks as one of the world's best sculptors.

Clark Noble, who now lives in Washington and maintains there one of the finest studios in the United States, is a complete contradiction of the traditional idea of what the professional sculptor should be and look like. Meet him anywhere on the street and talk with him, and you will think he is a dynamic and forceful captain of industry. Sturdy, stocky, overflowing with energy, and extremely loyal to his likes and dislikes, he is the exact antithesis of that long-haired, dreamy-looking, flowing-necktied individual whose picture we conjure whenever we attempt to visualize the word "artist."

Mr. Noble's rise to fame has been meteoric. His training is a direct violation of all the traditions which long have governed the American art world. He has never been the pupil of foreign masters. He is wholly an American-educated sculptor. Notwithstanding, his works have won innumerable awards in competition with the best sculptors of the United States and Europe. The foreign masters of the day recognize Noble's greatness and genius. They are unanimous in proclaiming him one of the best sculptors of the present period.

The crowning event in the life of this New World artist is to be the erection of a great memorial to American womanhood which will probably be built in Washington. This monumental structure has been his cherished dream for forty years. He has personally expended more than $40,000 in the designing of plans and in the construction and rejection of models. All his spare time during the last four decades has been devoted to the development and perfection of this magnificent tribute to womanhood.

The memorial will cost $5,000,000, and will be five years in building. It is to be 168 feet high and 300 feet wide. It will be built in the form of an arch standing upon an elliptical base and broken by flights of steps. The arch itself and the multitudinous stairways leading to it are to be of marble. On either side of the massive arch there will be a bronze panel thirty-eight feet high ornamented by groups of figures in low and high relief. The interior of the arch will be dedicated as a hall of memorials and records representing the achievements of American womanhood.

Clark Noble's contributions to the world of American art have been erected in the Eastern States, in the Vatican at Rome, and in other parts of Europe. His bronze relief of Phillips Brooks in the Church of the Incarnation, New York City, is one of the largest and most remarkable examples of ecclesiastical portrait-sculpture in America, being seven feet in height. His statue of Robert Burns, valued at $40,000, is another masterpiece, as are also remarkable busts of Longfellow, Hawthorne and Henry Cabot Lodge; three specimens of his work that are displayed in the Vatican; the sailors and soldiers monument at Newport, Rhode Island; statue of General Porter in Van Courtland Park, New York City; challenge statue, Antietam; colossal statues of Napoleon, Jefferson, and "Mad" Anthony Wayne; ideal statue for the Maine state capitol; statue of "Knowledge" for the Augusta public library; bas-relief of General Joseph Wheeler; ideal figure of the "Anglo-American"; monument of Belle Archer; ideal group, "The Morning Tide"; statue of Harriet Beecher Stowe; $5,000 Jefferson loving cup, and many other bronzes, memorials and portrait sculpture of public men.

Mr. Noble is outstanding among American sculptors inasmuch as he never uses living models. All his statues are his own creations. He has devoted years of earnest study to the science of anatomy. He has spent two years in exclusive dissecting activities in medical schools and private places of research so that he knows every crook and curve, angle and arch of the human body, how it is put together and how each muscle functions. Clark Noble is probably the most expert anatomist among modern artists. His thorough anatomical knowledge enables him to mold human figures which are ideal both from the viewpoint of art and from that of medical science.

If, as a result of some trick of fate, Clark Noble had to abandon his work tomorrow, there are at least a half-dozen other trades and professions with which he is familiar that would yield him attractive incomes. A little more study and he could pass the medical examinations in any state. He is an expert draftsman and architect. He is a talented worker in wood, plaster, marble or bronze. He is also a skilled modeler. He has invented at least two important sculpture processes. He could even qualify as an athletic coach, as for many years he has ranked among the leading boxers and fencers of America.

Clark Noble is a thorough American. His early ancestors came to the New World in the *Mayflower*, one of his forbears being an intimate friend of Miles Standish. Matthew Noble, a famous English artist, who painted some remarkably fine pictures of Oliver Cromwell and the Earl of Derby, is one of his progenitors.

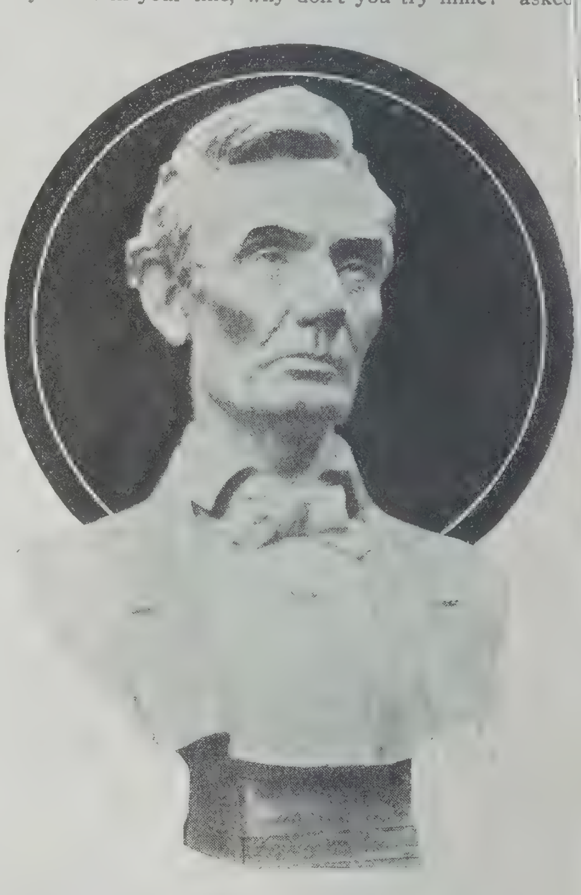
The father of Mr. Noble was a courageous sea captain who lost his life when his ship sank in a violent storm. Young Noble at that time was only ten months old. A grandfather, who lived at Gardener, Maine, took charge of the orphan. Clark first displayed evidences of artistic talent at the age of six years when he began to model tiny animals and figures of men from clay which he dug from a hill at one end of his grandparent's farm.

Two years later, the youngster somehow or other got hold of a book about the life of Thorwaldsen, the famous Danish sculptor. The boy read the book again and again. There and then he determined to become a sculptor like the famous Dane. During the succeeding six years, young Noble went to school, and then he started to work in the Maine mills. After he had saved sufficient money to pay his expenses for several months, the boy went to Boston where he secured employment in an architectural and modeling establishment. He worked so industriously and studied so diligently that at the age of seventeen he was foreman over eighty men.

About that time the National Modeler's Union was organized. One day a big Swede, who could speak o in broken English, visited the workshop and inquired the foreman. When Noble appeared, the foreigner tr to force him to join the union. The youthful mode refused, and in the altercation which ensued became enraged that he knocked down the labor-organizer. a consequence, Noble lost his position. No similar esta lishment in Boston would employ him until he made h peace with the union labor authorities.

In desperation, the young man finally went to Ne York City where he found conditions the same as tho that existed in Boston—he must become a union ma if he wanted to work at commercial sculpture. He the visited Philadelphia and Baltimore in quest of work, an ultimately went as far west as Chicago. There wer plenty of jobs open, but in each case he was required t join the union.

Defeated and discouraged, Clark Noble returned t Boston and by chance stopped at a gymnasium where h previously had boxed with the physical director. Clar confided his troubles to this friend. "If you can't ge any work in your line, why don't you try mine?" aske the physical culturist. "I know a chap who is organizing a troupe of professional athletes to make a vaudeville tour of the country. Say the word and I'll get you a job with that crew, as they need another boxer of your weight and ability."



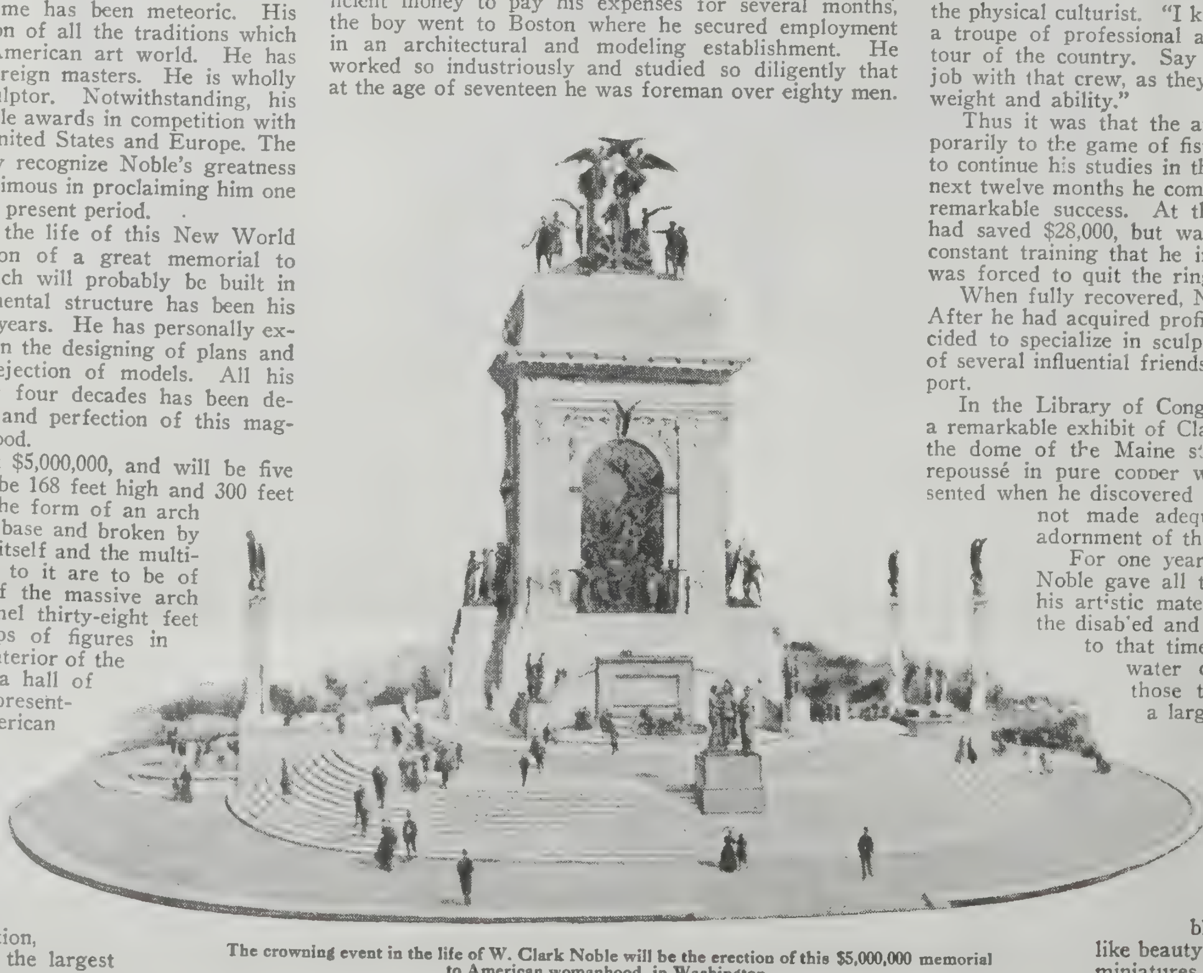
Noble's bust of Abraham Lincoln is another masterpiece.

Thus it was that the ambitious student turned temporarily to the game of fisticuffs to earn enough money to continue his studies in the sculptor's art. During the next twelve months he competed against all comers with remarkable success. At the end of the year, the boy had saved $28,000, but was so weakened physically by constant training that he incurred a serious illness and was forced to quit the ring.

When fully recovered, Noble resumed his art studies. After he had acquired proficiency in architecture, he decided to specialize in sculpture, and with the assistance of several influential friends he opened a school at Newport.

In the Library of Congress at Washington there is a remarkable exhibit of Clark Noble's work. Crowning the dome of the Maine statehouse is a gift statue, a repoussé in pure copper worth $35,000 which he presented when he discovered that the state legislators had not made adequate appropriations for the adornment of their capitol.

For one year after the World War, Mr. Noble gave all the income from the sale of his artistic material to a special fund to aid the disabled and wounded soldiers. Previous to that time, he had painted in oil and water color as a hobby. During those twelve months, he produced a large number of marine pictures which were sold by auction at high prices. Many thousands of dollars flowed into the war veteran fund coffers as a result of this novel form of contribution from one of America's foremost sculptors. Mr. Noble is also noted for the life-like beauty and accuracy of his portrait miniatures in porcelain.



The crowning event in the life of W. Clark Noble will be the erection of this $5,000,000 memorial to American womanhood, in Washington.

What the Northwest Farmer Thinks of His Job

Favors Diversified Farming and Better Equipment

By MALCOLM C. CUTTING

IF YOU ask the farmers of the Northwest what in their own honest opinion are the main requirements for the restoration of prosperity in their section, they will tell you, first, diversified farming and co-operative marketing. Then they will recite, in order, labor-saving machinery and equipment, purebred sires for their herds and flocks, the planting of corn, and the seeding of alfalfa, clover and other legumes. Only ten per cent of them will bridle up and say that this idea of self-help is all bunk, and that the only way the farmers of the Northwest can make a profit is for the government to raise the level of farm prices.

It all started from a paragraph or two in Mr. Henry Ford's book, "My Life and Work," wherein Mr. Ford stated that farming is unprofitable largely because of the waste of energy, lack of proper equipment, and inefficiency of method on our American farms.

Mr. Dan A. Wallace, editor of *The Farmer* (St. Paul)—and, by the way, a brother of the Secretary of Agriculture—quoted passages from Mr. Ford's book and asked his readers what they thought of Mr. Ford's opinion, assigning as a subject for discussion, "How the Farming Methods of My Community Can Be Improved." The response was 275 letters from farmers in six states—letters that were thoughtfully considered and carefully prepared—and the consensus of opinion of these farmers was substantially as given in the first paragraph above.

After studying and analyzing these letters, as the writer was privileged to do, one must commend in unmeasured terms these Northwestern farmers for their honest insight into their business, their sane outlook upon its future, and their courage in "carrying on." Burdened with economic conditions for which they were not responsible and over which they have no control, they yet see that their main hope of salvation lies in their own efforts toward the attainment of greater economy and efficiency in their own practices and methods.

Once in every month the Chamber of Commerce of the United States publishes in its official organ a "business map" of the United States, to visualize in graphic form the conditions of business as they exist in various portions of this fair land of ours. Where the map is white, business conditions are said to be "good"; where it is lightly shaded, they are said to be "fair"; and where it is black, they are described as being "slow."

In the March map of this character, there were two small portions and one large portion of the United States placed under the black shroud. The large portion encompassed a small strip of Western Minnesota, all of North Dakota, the northern and western parts of South Dakota, the great plains region of Montana, and the northeastern portion of Wyoming. It happens that this black area comprises almost exactly the entire spring-wheat-growing region of the United States.

A Natural Grain Country

PEOPLE are likely to wonder, outside of the Northwest, why it is that our famous "Hard Northern Spring Wheat" has descended to such grievous depths of economic depression. What is the reason?

It can be very easily and briefly explained.

In the first place, the yield of spring wheat is always normally less than that of winter wheat. The latter is seeded in the autumn, it gets a start in early spring, it has the benefit of all winter and spring moisture, and it matures and is harvested before rust or the withering heat of late summer can injure it seriously.

Spring wheat, on the other hand, is not seeded until the ground is dry enough to work in the spring; it has to undergo all the vicissitudes of rust and drought and grasshoppers and hail during the summer months; and it is not harvested until all of the great crop of winter wheat has been shoved onto the market and the price is "broke." So, besides a smaller yield due to natural conditions, spring wheat has to offer itself on the tag end of a glutted market. Add this to the prevailing low prices for all wheat, and you will understand why the spring-wheat farmers of the Northwest are economically and mentally depressed.

Why do they grow spring wheat at all, then, you ask; why don't they grow something else? Because the Northwestern prairies from the Red River Valley to the Rocky Mountains are (or were) a natural grain country, and because it is not so easy to grow some other crops in the drier portions to the westward and the colder portions to the north.

The farmers of the Northwest were headed in the right direction—they were going rapidly into diversified farming before the war, until the government called upon them to produce wheat, *and nothing but wheat*, to save the world for democracy. Then, when the war was over, the price of wheat went down, while the cost of production remained up; with the agricultural consequences which the world knows.

Diversified farming means the raising of *livestock*—dairy cattle, beef cattle, hogs, sheep, poultry—and the growing of *feed crops* for this livestock, in addition to *cash crops* such as wheat or potatoes. The principal feed crops needed in the Northwest, in addition to the grain now so largely grown, are corn and tame grass crops for hay and pasture.

But it is not so easy to grow corn in the northern parts of this section as it is farther south, and it is not so easy to get a catch of alfalfa or clover or any other grass crop in the western parts of this section as it is where moisture is more abundant. They can be grown, and they are being grown, everywhere; but it takes more care and better farming to establish them than in some other sections. That is why the farmers of the Northwest deserve credit for their determination once more to turn over their system of farming.

In the discussion, "How the Farming Methods of My Community Can Be Improved," 275 letters were received by *The Farmer*. Of these, 169 came from Minnesota, forty-one from North Dakota, thirty-three from South Dakota, nineteen from Wisconsin, eleven from Montana, and two from Iowa. As stated before, the inspiration for these letters was the comment of Mr. Ford on the inefficiency of average farming methods, quoted from Mr. Ford's "My Life and Work" (Doubleday, Page & Company).

What did these farmers think of Mr. Ford's criticism of their methods—did they disagree with him? They did not. Of the entire 275, only twenty-eight rose up in wrath and said that Mr. Ford did not know what he was talking about. These were the ten per cent who ascribed all of their difficulties to economic conditions, and to robbery by "big business," and to desertion by the government—without ever a thought of the remotest responsibility attaching to themselves.

On the other hand, forty-three of these writers, or sixteen per cent, agreed partly with Mr. Ford, saying that his criticism of equipment and methods was just, but that the meager returns from farming permitted only the most gradual, if any, improvement. And the real surprise came when sixty-six of these writers, or twenty-four per cent, stated emphatically that Mr. Ford was exactly right, without any reservations whatsoever. Furthermore, the remaining 138 writers, or fifty per cent, while sticking strictly to their assigned subject of farming improvement, indicated by the tenor of their letters that they agreed with Mr. Ford, too.

So of these 275 representative farmers from six Northwestern states, *we have ninety per cent admitting that they can do much themselves to increase the profits from their industry, and we have only ten per cent who repudiate any such suggestion and place the entire blame for their condition on "business" and the government.*

Now for the improvement of farming methods in the Northwest which ninety per cent of these farmers propose. As stated in the first paragraph of this article, the most nearly unanimous vote was for diversified farming, 219 of the 275 writers specifically advocating this system or indicating by their letters that they practice it and approve it. Of the various kinds of livestock mentioned in connection with diversified farming, the preference seemed to descend in the following order: dairy cows, hogs, sheep and beef cattle. Most of the writers, too, advocated poultry as the payers of grocery bills, and fifty-five of them specifically recommended very much more careful attention to poultry as real money-makers on the farm.

So far as the preference in livestock was expressed, a little extraneous comment may be of value. Minnesota and Wisconsin are great dairying states, and the dairy cow has brought prosperity to thousands of farmers. Knowing this, the farmers in the grain-raising sections farther west, when they begin to diversify, look immediately to the dairy cow.

Because of the excellent returns from dairy products during this period of agricultural depression, as compared to the unsatisfactory market for hogs and beef cattle, farmers all over America have been expanding the dairy business. Only recently the United States Department of Agriculture issued a guarded warning against a possible overproduction of dairy products. This did not mean that dairying should be curtailed, but only that farmers who are so situated that they can handle other kinds of livestock to advantage, and perhaps to better advantage, should give them at this time equal consideration with the dairy cow.

What Diversified Farming Means

HOGS were given second preference by our Northwestern advocates of diversification, not as a major project, but as economical supplements to the dairy industry. In that they were exactly right. Hogs are almost essential to the dairy farm, to utilize the skim milk that is left on the farm when the cream is separated and sold to the creamery.

In the corn belt, on the other hand, where hogs are a major project, there has been great dissatisfaction with hog prices because of the unfavorable ratio between the prices of hogs and corn. As a result there has been an enormous liquidation of hogs this season, and the Department of Agriculture suggests that the peak of overproduction of hogs now probably is past. With an indicated increase in the acreage of corn, and with large liquidation of the hog supplies, it would seem to be a good time to stay in the hog business, particularly on the dairy farm.

A similar situation prevails in the beef-cattle industry, which our Northwestern writers barely mentioned. When the war ended, the export demand for beef dropped suddenly, and farmers were left with over-expanded herds of beef cattle in the face of a falling market. Liquidation followed rapidly, but the price for beef has remained low. It has seemed for some time that a shortage of beef cattle must soon be apparent, though no such shortage has been indicated by the market price. It would be well for farmers to watch the beef market attentively from now on, because some of these days a herd of beef breeding stock, or a bunch of feeders, is going to be a valuable adjunct to the farm.

Dairy cows, hogs, sheep, beef cattle—the order of preference as given by these farmers is probably right for the Northwestern farm. But the relative unimportance of sheep in this list is somewhat disappointing. Northwestern farmers are rapidly increasing their flax acreage; they might well give more consideration to sheep.

As far as poultry is concerned, there has been an enormous expansion of production during the past two or three years, which expansion is still going on; but so far increased consumption has kept pace with the increased supply. Whether the market be high or low, every farmer should have a flock of poultry on his farm, to contribute to the home food supply, to help utilize waste products, and to reduce the monthly store bills that sometimes are hard to pay.

Returning from this little excursion into livestock production as a phase of diversified farming, and considering again the various means by which our farmer writers propose to improve their methods, we find that the second largest vote was tallied for co-operative marketing. This is not at all surprising in the Northwest, because in that section the farmers have had a lot of co-operative experience, and just at present they are busily engaged in organizing some of the largest co-operatives in the country.

Just recently a potato campaign was concluded in Minnesota, in which 12,000 growers signed up 160,000 acres of potatoes, or more than fifty per cent of the crop, to be sold through the Minnesota Potato Growers' Exchange. At the present time the poultry products of that state are being organized in the same way. The dairymen of the state are already organized in the Minnesota Co-operative Creameries Association, including 450 local creameries with 75,000 farmer patrons, and in the Twin City Milk Producers' Association, including 5,000 dairymen supplying market milk to St. Paul and Minneapolis. Over in Wisconsin they have the Wisconsin Cheese Producers' Federation. In the Dakotas they are now organizing the potato crop, and a considerable portion of the wheat crop of the spring-wheat states is now organized in the American Wheat Growers Associated. The farmers of the Northwest know something about co-operative marketing, and they are determined to develop it through their very own self-controlled and self-governed marketing agencies.

Labor Saving and Legumes

NEXT in total vote came the use of labor-saving machinery and equipment. The labor problem is one that is seriously disturbing farmers these days. High wages for labor in the cities have attracted the workers from the farms. Thus the Northwestern farmer is left with little or no help, and the need of labor-saving machinery and equipment is painfully apparent to him. He is purchasing it, too, as his means enable him, rather than pay the wages which farm workers demand.

Of the total vote on labor-saving machinery and equipment, it is interesting to note that ninety-nine farmers advocated the purchase of such equipment as rapidly as financial means would permit, while ten farmers averred that there is too much machinery on farms now! Where the tractor was specifically mentioned, twenty-eight were favorable and five were opposed. A considerable number also spoke favorably of the motor truck.

Purebred sires for all herds and flocks followed closely in order of precedence. It is commonly said that "the sire is half the herd," and farmers who start with purebred sires are taking the first step toward profitable livestock production. In dairy cattle it means larger milk production, and in meat animals it means more economical gains and better quality. There is always a market for quality, for every product that comes from the farm. The curse of livestock production on too many farms is the perpetuation of inferiority by the use of scrub sires. With the purebred sire, even on scrub stock, there is constant improvement.

Following in order of total vote came corn and legumes as essential items in a proper system of diversified farming for the Northwest. In Southern Minnesota, Wisconsin, Iowa and South Dakota, corn is a staple crop and the vote from these sections was not recorded. In Northern Minnesota, North Dakota and Montana, hardy varieties of corn are just winning their way, and the advocacy of this crop by farmers is a matter of some concern.

Corn is not only the very best and most abundant feed crop that can be grown, but as a cultivated crop it serves an equally valuable purpose in cleaning the land of weeds. In the drier West, too, corn can be planted to serve the purpose of summer fallow, conserving moisture for a succeeding crop of grain, without losing a year's use of the land. To the grain farmer of the Northwest, corn is the straight path that leads to economic salvation, if he has good livestock to utilize the corn.

Of almost equal importance to this section as a feed crop are the legumes—alfalfa, common clover, sweet clover, and possibly soy beans. These leguminous crops are very high in nutritive value, particularly protein, and they have the added value of improving the fertility of the soil by taking nitrogen from the air and storing it in the roots of the plants. Where alfalfa will not grow, sweet clover usually will make a stand; and these two crops alone will solve most of the hay problem.

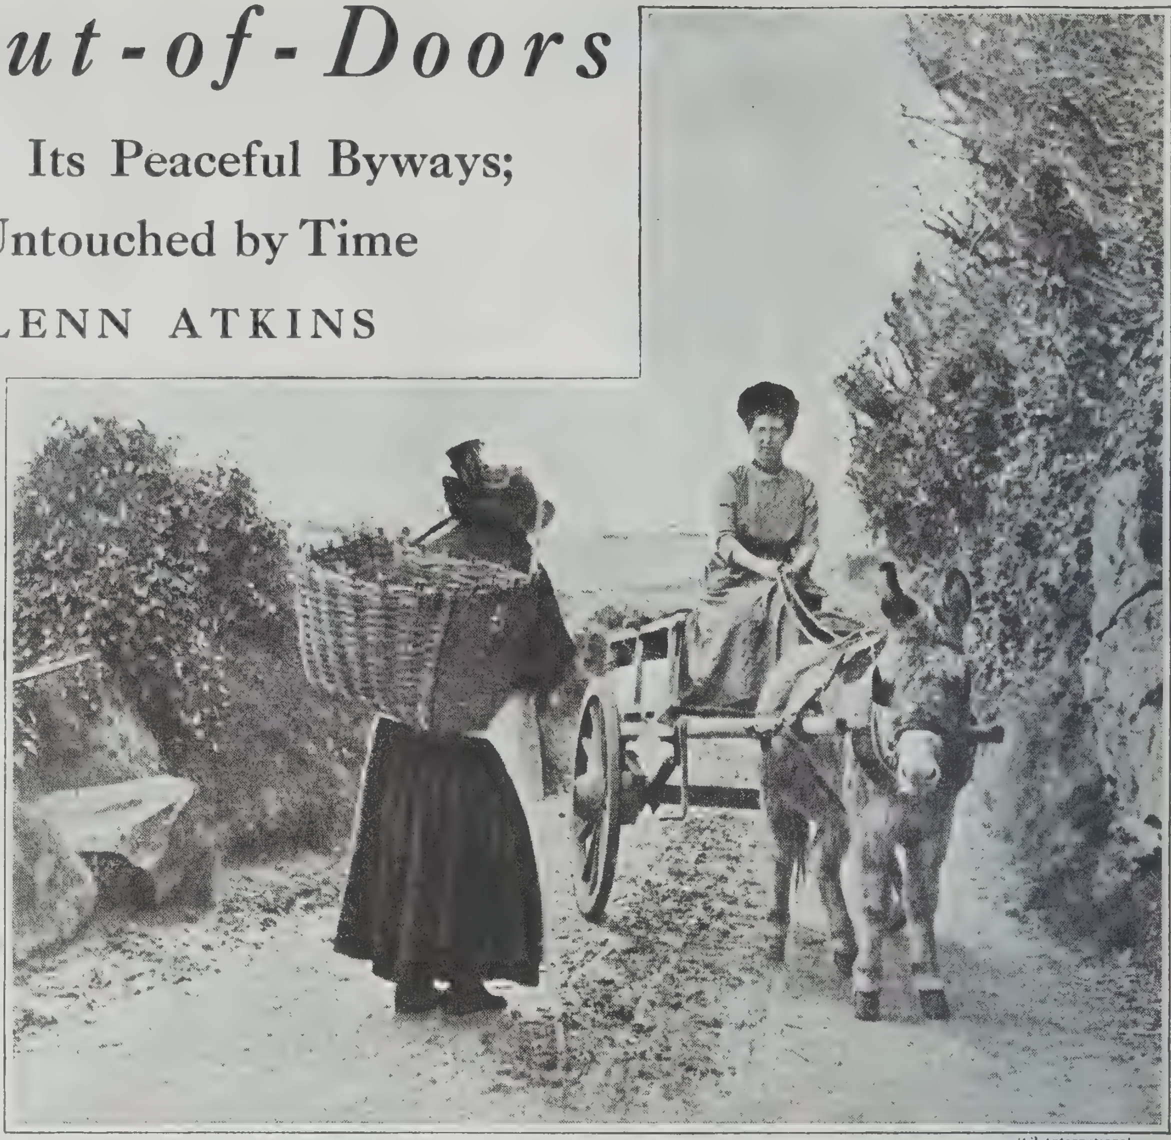
One could go on and discuss in detail the other items of improved practices recorded in this farmer vote, but it is not necessary here. Better care and repair of expensive buildings and machinery; a silo to utilize the corn crop economically; more careful attention to poultry, too often a neglected side line on the farm; better buildings; cow testing for production; the home garden; weed eradication; rotation of crops; the keeping of farm accounts; better feeding of livestock—all of these were advocated, in the order given.

This is the first of two articles, the second will appear in an early issue.

England Out-of-Doors

Some Impressions of Its Peaceful Byways; Quaint Villages Untouched by Time

By GAIUS GLENN ATKINS



(C) International

Picturesque scene on the Cornwall coast. On the road to Penzance from the little Cornish fishing village of Mousehole. Mousehole, a quaint, picturesque coast town, nestling at the foot of the famous Cornwall Hills, was a flourishing port when London was but a booming town. The old lady in the foreground of this excellent photograph is carrying what is known as a "camel," an old-style fish-basket which is now seldom seen.

YOU may take tea with England behind the garden gate; you may walk London streets with the shades of Dickens and Samuel Johnson; you may see English affairs through the eyes of her newspaper men, but you have never known England till you have followed, from farmstead to farmstead, the footpaths which thread her fields. You cannot see rural England from the highroads; there are too many head-high walls along the main traveled roads which lead from city to city, too many untrimmed hedges along the lesser winding roads—lanes they call them often enough—which lead from village to village. But always behind the wall or the hedgerow is a footpath known only to the countryside, though you may get maps, if you want, which show them all, and spend a summer "tramping" them and never touch a highroad save to cross it.

One comes nearer the heart of England by such ways as these than by any other road, yet always with a qualification. English footpaths follow tremendously old rights of way; they run, also, through history and literature. I played golf last summer on a course which had been a park since Anglo-Saxon times, its turf untouched these thousand years by a plow. The old Dover Road which Chaucer's pilgrims took to Canterbury ran one side of it; a road which the Romans used when their legions came over from Rome ran the other. There is enough history above ground or underground in any English countryside to keep a local historian busy without going beyond the sight of his parish church spire. This makes it hard enough to get at the heart of England; there is too much you never see. But the other difficulty goes deeper. The roots of any long and unified national life are always in vitalities of tradition and old manners of life, and unless you have lived, as few of us have, all your life where your great-grandfather spent his life you never know the old customs, old words and old lore that combine to create what is always most distinctive and persistent in the life of any people; you walk past it and vaguely feel that it must be there if you could stop a hundred years and feel it out.

Rural England is, to begin with, something over forty "counties" as crooked as Virginia counties and as hard to count as sheep. Boundaries twist and intertwine till you count them twice even when entirely sober. Each county has history enough to do a nation, and the very names on the guideposts tell you of Angle or Saxon, Dane or Norman. A more specious map breaks the counties into parishes and an ordinance map, the best map to walk by, breaks the parishes into farmsteads and bench levels, and waters and watersheds, and a maze of winding roads and a net of footpaths, and lays England before you dissected to the last branching nerve. There are strange contrasts in density of population. You are never, anywhere, fifty miles from a city, ten miles from a market town or five miles from a village. But not a little of rural England seems strangely empty for all that.

There is an excess of "park land." Anything less than forty acres around the kind of a house an American builds on a hundred-foot-front lot on a boulevard smothers an Englishman and he begins to breathe freely only when he has managed a hundred acres or so. The great parks about the great houses run easily to eight hundred or a thousand acres and the total of such land uses is in proportion enormous. They are not economically valueless; they are richly wooded with a noble growth of timber, largely oak, and constitute the forest reserve of England. They are a bank reserve as well. When a dissolute baron uses up everything else, he begins to cut down his park oak. They also, in their more open spaces, make good sheep pasture.

English trees generally are lower than American, with a wider spread of branches just too high for the cattle or the deer—for often enough deer feed beneath their dappled shade—to browse them. They are scattered rather than massed and save on the treeless moors, of which more presently, they fill the foregrounds of every English landscape with their living green and the backgrounds with their unbroken sky line.

But since the houses are much hidden away thereby, outdoor England is often enough strangely lonely.

France farms largely from village centers. French land holdings are too small to waste on building and farmyards, so the houses are built at the center of the commune on an untidy winding street with the barnyard in front and whatever is clean and sweet behind, and the little fenceless fields about the village leave not a "turning row" between the holdings. I am writing now of Northern France. Brittany is different, as those members of the A. E. F. who bivouacked in the mud-walled little fields about Brest know to their sorrow.

England is a land of both villages and farmsteads. The villages are everywhere and from the outside they are often a bit disappointing. They are always clean but they are excessively brick. Little brick houses and little brick shops flush with brick sidewalks along narrow, hard paved, crooked streets. On the edge of the village larger houses showing upper stories behind a screen of green and more brick wall, a bit of common, maybe, and always an old church or two with its burying-ground quiet and yew-tree shaded, but for open, gracious beauty the best New England villages, with their old arched elms, their white Georgian houses and their white or red brick meeting houses, with an old town hall, the village memorial library and often enough the academy, need ask no odds of most English villages outdoors.

English fields are small and irregular. They are generally hedge-fenced, though wire is coming in, and the hedgerows are a thick and heavy growth too largely untrimmed. They are commonly hawthorn with a bit of hazel, and in May they are masses of white and odorous bloom. Blackberries a-plenty take shelter beneath them. I do not know the proportion of pasture to plow land but it is large, and English grass land is good pasture—the rains see to that.

The plow lands are planted to "roots"—turnips and beets largely used for cattle feed—beans for humans and for horses, oats, barley and wheat. The small grains grow astonishingly. Wheat stands level and full-headed. The tops of a well-headed field seem solid enough to walk on. We cannot touch their average yield an acre, even on our best new wheat lands. I discussed this last summer with a thoughtful farmer who thought perhaps the slow ripening of the wheat explained the big, well-filled heads. Ohio wheat heads out full and ripens in less than a month beneath a hot sun and always with the chance of drought.

English wheat is as leisurely in its habits as the farmer who plants it. It will never do to cut, even in the south, before mid-August and it is sure of plenty of rain—if anything, too much. English harvests often are slow because the grain is so badly down, but they get it cut, every straw of it.

All the culture of the soil is carefully done. The plowman's furrows are straight as a string and wonderfully even. In general and in a sentence, outdoor England has every mark in its care of a land long lived in, greatly loved and farmed out of a deeply rooted experience. There is market gardening a-plenty near the larger towns. For all the hedgerows and parks there is a careful use of corners and little strips of land for potatoes and cabbage, but there is no such complete use of every inch as in pre-war Germany or Belgium. An English strawberry is a bit watery but fragrant and sweet. There are plenty of apples and cherries, plums and pears, but the peach matures only under glass or on the south side of a brick wall where the tree is, as it were, crucified against the wall. Peaches are sheer luxury in England, and cost from a shilling apiece up. They get a certain compensation in gooseberries. I had, as a boy, an English story book in which the unpardonable sin of wayward English small boyhood was stealing gooseberries. That seemed to me a waste of original sin. The only gooseberries I knew were the Southern Ohio variety, hard as bullets when green, squashy when ripe and sour as my elderly schoolmistress. Why any boy with a talent for wrongdoing should steal gooseberries I couldn't imagine. But the English gooseberry is big and succulent, sweetly acid like a well-spent life, and worth stealing. Curiously enough, transplanted to our climate, it degenerates into the sour prickliness of our gardens. But an American gooseberry pie, given sugar enough, will run neck to neck with the ubiquitous English gooseberry tart for all that.

One misses Indian corn; you must go to North Italy to find that. There are few insect pests. Nor do they fight the gypsy moth and the brown-tailed and the many foes of green things we wage war against. But the rose grower has his thrips.

There are always birds and English birds were always looking like something they ought to be and were not and drove me—who used to know even the fine distinctions of our American warblers—to despair. The climate is kind to them and they love a land whose poets have woven their singing into the texture of the poet's song. The English robin is smaller than the American, with a friendly way and a reedy note and a rose-red breast. The thrushes are plainly kin to the American thrush, the sparrow holds his own as everywhere, the skylark sings out a rapture of aspiring but baffled flight from the sky he is forever seeking and missing and the nightingale is the poetry of song and a prosaic fact. The hedgerows are sociable with birds whom an English naturalist would name for you in a moment—but I can't. I do think the year through there are as many birds in America as in England and as brave singers, but our cold winters and hot summers make them briefer visitors. I heard nothing to match the unearthly call of the veery, or the liquid whistling note of the white-throated sparrow in our northern woods, nor saw anything so brave and swaggering as our Kentucky cardinal, but I have never been in England at the best bird time.

Climate is a master fashioner of habit, and outdoor England reflects in constant and countless ways the English climate. English houses are more or less heated by coal grates, but the tight little island itself is heated by hot water. London is north of the southern tip of Hudson's Bay and Liverpool is north of Newfoundland. A materialist who was minded to maintain that we owe English history and English civilization to the Gulf Stream could make a good case.

The sun is much acclaimed over there—when he shines—but his influence is more or less negligible. He is an adornment of the sky and a brightener of the land rather than a dependable sort of warmth. It can be hot in England—honestly hot—but the Gulf Stream is the real source of heat and fog as well. It can be dry—I've seen the grass on the lawns as brown as my blotting pad—but two weeks of dry weather is a drouth. An even temperature and unfailing rains give a wealth of pasture and foliage, make all green growth juicy and, through ages of green growth taken back into Mother Earth again, give a wealth of humus to English soil and green and rounded contours to all the hills. Snow is little known nor lies long south of London, and twenty degrees Fahrenheit is bitter cold. The mists are never quite cleared away; even a brilliant day has the softness of mist wraiths suffused with light and a perfectly cloudless sky is rare enough. There is always a soft breath of cloud even in midsummer which shifts and darkens and dissolves in rain. The rain is a matter of course, but the English of the island dress for it and carry able-bodied umbrellas and never forget their mackintoshes, and flourish as do their pastures.

This matter of climate goes deep. It "damps," as a musician would say, nervous energy. There is said to be less electricity in the air and far less in life than in America. But it contributes constancy and staying power and shapes, through its evenness, the outdoor habits of the race. I suppose there are five days the year through in England when one can be comfortable outdoors to two in America. At any rate, somewhere west of this Gulf Stream coming home the very sky changes and, if the weather be fair, a certain brilliancy in light and air comes out to meet and tell you that you have left to the east and north a little island which lives out of borrowed warmth, water carried, and are steaming into a climate where the sun really counts for something.

Outdoor England is rarely level, generally gently rolling and rising in the downs and the moors to upland openness. The "downs" are really "ups"—treeless, wide-bosomed hills three to six hundred feet high, where the Southdown sheep feed, edging the eastern south coast and breaking where they meet salt water into Chalk Cliffs along which you steam for hours as you come up the Channel. The moors belong to the north; really vast and open, billowy highlands, a thousand feet above sea level, treeless, poor pasture, sparsely populated and bleak; and to Devonshire with memories there of John Ridd and Lorna Doone. The moors are much covered by big ferns but also by heather, white and purple, and gorse. The gorse blooms yellow as our goldenrod and the heather is so solid in its flowering that the purple of it lies across the moors a rich shadow. A Devonshire moor in September, high and lonely, with only scattered sheep for company and a sheep track for a road and a light-filled sky above you and the gold and purple of gorse and heather at your feet and a "tea" of Devonshire clotted cream and bread and butter and jam and pound cake at the end of the afternoon tramp, is something for which to go far. You are never thereafter quite content, as those who have found in old stories some open door into fairyland, come back with haunting memories which make them strange to their friends and their world.

But my pen protests, for there are English villages seemingly untouched by time; the tides of the years have found another channel for their driving current or else flowed so gently through these Old World little streets as only to have enriched them with the suggestion of an immemorial and tranquil order, ripening through the years.

Here old timbered fronts reach over the pavements to touch and greet one another. Worn brass knockers and doorknobs, polished till they shine, are witness of a kindly hospitality and the touch of vanished hands. The village inn is stone-flagged, with darkened oak timbers showing honest craftsmanship, and the churchyard is packed with old gravestones whose names the mosses and the years have softened into something impersonal and universal—traceries of vague forms of names and dates and birth and death, the record and lowly fortune of humanity. Here are thatched roofs and roses and hollyhocks, the English village of your dreams not yet subdued to sanitary tenements and progress.

International

Quaint old clock is one of the sights in Surrey, old England.

You are never anywhere quite out of sight of a church tower or spire—towers in Norfolk and the north generally, spires in Warwickshire and the south. This is only an impression—but reasonably dependable. There is, in all these northern churches, the suggestion of a beleaguered land where the Dane might come in from the seas, or the Scotsman from the lowlands, and the church become the last stronghold of a harried countryside, "half fortress and half church of God." But the spires of Warwickshire are grace and aspiration lifted above a tranquil land to a serene sky. Nor would I forget the lovely towers of Lincoln whose fortress strength is lightened and adorned with a grace of building which, touched but not wholly subdued by the pointed arches and vaulted ceilings and rich tracery of medieval French architecture, is so characteristic of the best old English.

The English parish church is a study in itself—a monument to the devotion and faith of the centuries, resting sometimes on Saxon foundations and adding to Norman towers and round arches changing forms of beauty or of need, the whole mellowed by the years and enriched in painted windows and memorial tablets and oak beaming with a Crusader's tomb or a poet's grave and the memories of a great race made manifest in proud and simple ways. You find them everywhere: sometimes on the edge of a park, sometimes down a village lane, sometimes where the roads cross, and once—as I remember in the Isle of Wight—where only the footpaths meet. The "chapels" make a poor showing beside them and testify to that, for there is abundant witness that it's hard to be a non-conformist in England. But the free churches are vigorous for all that, though they belong mostly to the cities and large towns. In rural England the squire and the vicar are a hard combination to hold out against.

English farm buildings—houses and barns—may well be the envy of an American farmer—old, spacious and gracious. They are brick or stone built, bearing witness in the very irregularity of their lines to a slow growth which has achieved something better than an architect's plans. At the best they are good enough for anybody. I remember really noble farmhouses on the Isle of Wight, wide-chimneyed and covered with the Virginia creeper, which flourishes in the soft English climate, the creepers themselves ruby red in early September, till they shone in the sunshine like a jewel. The barns are almost always stone or brick with cobble-paved barnyards and low brick and stone walls about the cobbled courts and their timbers silver weathered oak. Of course they are not all so good as this, but the average is high. Farm labor is housed in cottages which are anything from plaster walls and thatched roofs to square, bare brick and slate. Doubtless the older are damp and unsanitary, but they make the best kodak shots.

Law's Delay in Cronkhite Case

AS THIS is written, Rolland Pothier, in jail at Tacoma, Washington, awaits the decision of the District Federal Court as to whether that court shall assume jurisdiction, and proceed to try him upon the charge of having fired the shot which killed Major Alexander P. Cronkhite.

Captain Robert Rosenbluth, charged jointly with Sergeant Pothier for the killing of Major Cronkhite, is at liberty on $20,000 bail, provided for by Eastern friends and racial societies.

Five years and eight months, almost to a day, had elapsed on April 22, 1924, the day of Pothier's arrival at Tacoma, since October 25, 1918, when young Major Cronkhite was shot on the Camp Lewis military reservation.

Two years had elapsed since a Pierce County grand jury, the county in which Camp Lewis is located, after an expenditure of some $62,000, returned an indictment against Pothier and Rosenbluth.

As you read this the trial ought to be under way, or at least about ready to begin. A jury of their peers should be listening to the evidence which will decide whether, in their minds, Major Cronkhite died accidentally from his own hand (as was set up by the defense) or from a revolver in the hands of Pothier or Rosenbluth.

Five years and eight months would seem to be sufficient time in which to get the facts before a jury.

If the case goes to trial here there will be no difficulty in securing a fair and impartial jury to try the accused men. There is little or no racial feeling in this Northwest country except against Asiatics, and the truth is that more has been printed about the Cronkhite case in New York City than in Tacoma.

Rolland Pothier found friends awaiting him upon his arrival here, friends who had entertained him in their homes prior to that eventful October day which changed the course of his life, friends who find it hard to believe in his guilt.

The Tacoma Post of the American Legion has secured gratis for Pothier's defense Attorney Maurice Langhorne, who is rated as one of the best, if not the best, criminal lawyers in the state of Washington. This sets at rest any doubt that Pothier's defense, although he is a poor man, will be properly conducted.

Friends here say that Pothier shows greatly the effects of the long strain he has been under. People here knew him as a good-natured, friendly and even-tempered doughboy, about to set sail for France.

He was a good fellow, genial and well liked, a favorite at dinner and cruising parties because of a splendid bass voice, and therefore much sought after as an entertainer.

But October 25, 1918, changed all that for Pothier. On that day, Major Alexander P. Cronkhite, supervising the target practice of a company commanded by Captain Robert Rosenbluth, was found dead in a little frequented part of Camp Lewis. Pothier and Rosenbluth, who reported the death of Major Cronkhite, were the only members of the company actually present at the time of the killing.

Both were kept under surveillance until a military inquiry at the camp pronounced the death accidental. This decision of the military court, however, was not satisfactory to Major General Adelbert Cronkhite, father of the young officer, and upon his return from the battlefields of the World War, he set in motion machinery which finally resulted in an indictment by the Pierce County grand jury.

This indictment is said to have been based partly upon a confession made by Pothier in which he stated that he had fired the fatal shot at the instigation of Rosenbluth. Since that time there have been reports, never substantiated, and about which Pothier now refuses to talk, that he had repudiated this confession.

The case, from this time forward, has been amply reported in THE DEARBORN INDEPENDENT.

Pothier feels that fate has been relentless in its pursuit. He is morose and asked for but one of his old Tacoma friends.

When asked about Rosenbluth he is quoted as saying:

"I don't know anything about him. I don't see him or talk to him. I tell you I don't know anything about him."

"Do you feel he is double-crossing you?"

"I don't know—maybe."

Rosenbluth, when arrested, stated that he was ready to return to Tacoma. He immediately secured his $20,000 bail and was set at liberty. And in the interval, while the decision on jurisdiction is awaited, the campaign which has been waged from the time Rosenbluth was first accused, to make the charge appear as racial persecution, goes energetically on.

Pleading poverty on the part of the defendant, attorneys Louis Marshall and Jonah J. Goldstein, of New York, requested United States District Attorney Thomas P. Revelle, district of Western Washington, to provide funds for the payment of expenses of the witnesses for the trial.

Failing in this attempt, and learning from the district attorney that such a request was impossible of fulfillment, Rosenbluth's attorneys, through Emanuel Celler, representative in Congress from the state of New York, have appealed to the new attorney-general, Mr. Harlan F. Stone, to overrule the decision of his subordinate and pay the expenses of the witnesses summoned in Rosenbluth's behalf.

The Celler letter, a palpable attempt to override the district attorney who will have direct charge of the case if it comes to trial in the Federal court here is in line with the efforts that have been put forth from the very first to have the charges against Rosenbluth appear as racial persecution. Rosenbluth is a Jew. Pothier is of French-Canadian origin. No prejudice against Pothier has ever been alleged.

Pothier, who has been working as a railway brakeman most of the time in the past two years, and who leaves a wife and family without means of support, while he awaits trial or release, has not appealed to the Federal Government to bring to the stand witnesses in his defense.

Pothier and Rosenbluth were the only two men who saw the death of Major Cronkhite. They are the only two men in the world who can actually tell how the major died, and Pothier and his attorneys are very probably of the opinion that it is upon the statements to be made by these two participants or eye-witnesses that the question of guilt or innocence rests, and not upon witnesses who may be relied upon to testify that one of the accused is being persecuted because of racial prejudice. While such testimony is admissible in certain periodicals, there is no court in the land which would allow it to be introduced. In the language of the lawyers, it would be "incompetent and irrelevant."

In addition to the services of the New York attorneys, there has been retained to assist in the defense of Captain Rosenbluth Attorney L. L. Thompson, of Tacoma, until recently attorney-general of the state of Washington—a man whose honesty, integrity and ability cannot be questioned.

The question of jurisdiction which must be decided by Federal Judge Cushman is whether Camp Lewis was the property of the Federal Government or of citizens of Pierce County at the time of the shooting of Major Cronkhite. If Camp Lewis was Federal property, then the Federal courts would have jurisdiction; if private property, the state courts would be the proper place in which to try the case.

Citizens of Pierce County would be greatly surprised to learn that the government did not own Camp Lewis, for even before war was declared funds had been raised by public subscription to buy and donate land for the very purpose for which it was being used at the time of the Cronkhite killing.

Neither does it seem that the American public will be satisfied that justice has been done until Pothier and Rosenbluth have been tried and the facts brought out in open court. Pothier's own attitude is now that of a man who "wants it over with." If innocent, these men are entitled to the vindication which will come from acquittal; if guilty, the law should, of course, be invoked and the penalty paid.

The government attorneys have no other objective than to bring out the facts and try their meaning. The local attorneys for the defense are men of high repute and seek no ends but justice. As fair a jury as the nation can provide will hear the testimony and weigh the evidence. And the people generally will agree that it is only right that men indicted for crime should be tried.

That, in fact, is the great public issue involved: A certain group in the United States privately decreed that a man indicted for murder should not be tried.

Crashing Through the U. S. Immigration Gates

Concluded from page 4

immigration station in any port in this country refuses to accept the negative of the official on duty there. On the contrary, the immigrant merely sits down to live at the immigration station, his lodging paid by the steamship company which brought him over, until his lawyer has exhausted every resource of the local courts, the Federal courts, the state department, and finally, appeals to friends of the immigration officials. He has nothing to do all day but eat, smoke, loaf and play Mah Jong. In the language of the street, "he should worry" about immigration treaties or agreements of any kind.

Recently, at Angel Island, nearly 700 Chinese were kept for more than five months under conditions similar to these. Meanwhile, the steamship company which brought them over went out of business, and still owes the world's good-hearted Uncle Samuel this huge board bill.

When the Chinese, provided with his certificate, viséd by an American consul in China, arrives at an immigration station, let us say, Angel Island, because that is the gateway most of them choose, he is examined by a board of inquiry, which seeks to learn all about his antecedents and his qualifications for entry. The attorney for the Chinese may not be present at this inquiry, which is secret, but the Chinese may have a friend with him, and he may call any number of witnesses. That collusion between immigration officials and Chinese seeking entry may be averted, no one knows which official is to examine each Chinese until the immigrant is brought into the room. The questions which can be asked a man about his ancestors, his position in life, his financial condition and his family are limited, however, and the majority of the Chinese are provided with the proper answer to each question before they ever leave China. In the old days, when the immigration station was on the main waterfront of San Francisco, a Chinese who had safely passed through the questioning would stand outside the building and shout up to the other and waiting Chinese the questions which had been asked him, and the answers which had carried him past the examiner in safety. Now, however, the station is isolated from the city, and no one is allowed to see the incoming Chinese until he has been either passed on into the country or held at the station. Some interesting stories are told of the careers of Chinese who have entered the United States under the guise of "merchants." One store in San Francisco, which does a gross business of $5,000 a year, has, if immigration records are to be believed, 127 partners, that number of Chinese having claimed to be part owners in the little shop in order to establish themselves as bona fide merchants. Needless to say, once in this country, they merely spend a few days at the store, and then disappear into the laundries, the fishing industry, the vegetable fields, or some other work to which the Chinese laborer is accustomed. One man who was permitted to come into this country on his representation that he was a merchant, was found later working over an ironing board in a laundry. The immigration agent who found him, took him in, but at the hearing, the Chinese "merchant" testified that he merely had stopped in at the laundry to wash and iron some of his own clothing. The inspector testified that, at the time of the arrest, this Chinese was ironing a piece of lady's underwear, yet, because the officer had failed to bring along the bit of lingerie as evidence, the Chinese was released to continue his career at merchandising across an ironing board.

"Kankadon Brides," with their "husbands" in the background, on board a trans-Pacific liner entering San Francisco harbor. They are within the law.

A Chinese born in the United States, or who was in the United States prior to the passage of the Exclusion Act, is entitled to return to China, and to travel back and forth between the two countries as frequently as he desires. If he marries while in China, he may either bring his wife with him, or leave her there. In case there are children, the entire family may be brought to this country at any time. In other words, any Chinese man, woman or child, in China, who can prove that he or she is a son or daughter of a Chinese born in America, or of a Chinese who was a resident in the United States prior to 1882, may come to the United States whenever he or she wishes. If the father was born in the United States, the children are all American citizens, as well. This condition opens the gate for the entry of large numbers of Chinese to this country.

As a matter of record, a large part of the Chinese who come into the United States through San Francisco bring proof that their father was born on this side of the Pacific. How much of this "proof" is false, it is impossible to ascertain.

An Interview With a Gorilla

Concluded from page 3

this he is telling himself to "buck up." In the jungle the gorillas drum on their chests and cry to denote anger or challenge—and John has apparently adapted an inherent action to his present state of being."

John's comprehension is far greater than his powers of speech. He seems to sense the thoughts of humans with swiftness and clearness, particularly those persons who are constantly about him. He knows such words as "milk" and "orange," but Miss Cunningham feels that he senses what she means rather than actually understands the word. This belief of Miss Cunningham's is hardly borne out by John's actions, for about this time John stirred restlessly in his sleep, and showed that he was awake. "Go back to sleep, pretty boy," Miss Cunningham said softly, and John stretched out both arms toward his mistress.

"Pretty boy" is the name that John likes best. He is extremely fond of praise, and likes to think up a new trick, or a variation of an old one, so that Miss Cunningham will say, "Very funny, John, very clever." Then he will chuckle.

John Daniel, like the average human, gives a considerable amount of thought to his food. Back in his jungle days he was rather limited to uncooked dishes, but since he has grown accustomed to traveling across the world in Pullman cars and living in hotel suites he has developed an appetite for the most choice dishes. Chicken à la king is the dish he likes best of all, his next "favorite food" being a chicken leg. He is fond of oranges, and eats about a dozen in the course of the day. He is also partial to bananas, but they must be green. He has tasted meat, but does not care for it. Fish of any kind pleases his taste. Vegetables of all sorts are also on his diet list. He drinks milk, but not cow's milk, his brand being prepared from a milk powder. The reason for this is that at the beginning a famous physician decided that John was very subject to tuberculosis, and that he might contract it from cow's milk.

"In his diet, as in many other ways, I treat John as you would treat a child of approximately the same age," Miss Cunningham explained. "In some ways he is more keen than a child of five, in other ways he is backward. Considering the fact that he was running about the jungle a year ago, I feel that his adoption of civilization has been most rapid. I remember the first time I ever let him see himself in a mirror. He growled, and went looking for the other monkey. Then he seemed to sense that he was looking at himself and immediately he accepted the looking glass just as a human being accepts it—something in which to see one's own reflection. John knows his own photographs when he sees them, even when they are in a magazine, and he has no objection to posing. It seems to flatter him.

"I think one of the most interesting events of his career was when he began to walk about the house. He was unsteady at first, clumsy, and felt that he needed the aid of every piece of furniture. Now he walks on the flat of his foot, and while he uses his hands it doesn't seem that he needs the extra aid. When he is in a great hurry he uses the knuckles of his hands to help his progress over the floor. You would expect him to use the tips of his fingers, or the flat of his hand, but he keeps the hand tightly clenched."

It was about this time that Mrs. Baines and Mr. Penny, who had been dining downstairs in the hotel, returned to the suite, and shortly after the young woman who is making a statue of John Daniel also entered. The two women went to the bedside and spoke to the wide-awake John before joining the general conversation. John seemed to respond to their interest, even though he did not make a sound, or move from his comfortable place on the blankets. A minute or two later, however, he sat up, and assumed a pose that was at once suggestive of the figure in Robin's famous statue, "The Thinker." He watched us all with his great brooding eyes. It was very evident that he was thinking deeply, also it was evident that Miss Cunningham was trying to ignore him, hoping that if he was not noticed he would go back to sleep.

But John Daniel II was not going back to sleep. Not at all. His keen mind was devising a plan, and with a sudden activity he put this plan into being. He lifted his left arm, and began to rub a spot on his left side with his right hand. He whimpered.

For a minute this kept on. Then, with a quickness that every mother has used when going to the bedside of her child, Miss Cunningham crossed the room. John Daniel's eyes fairly danced.

"Yes—I know all about the naughty chair, how it bumped into the pretty boy, but you ought to go to sleep," Miss Cunningham told the gorilla, as she sat on the bed beside him.

John Daniel stopped whimpering, though he still patted his side. He put his left hand on Miss Cunningham's shoulder, and then looked about the room with a decided sense of pleasure. He had attained his wish, brought his mistress to his side, and firmly established himself as the center of all interest.

And all because he remembered that weeks before he had bumped into a chair while he was playing, and had really hurt his side.

Children have used that same trick of memory to attract attention to themselves ever since there have been children.

Presently John moved closer to Miss Cunningham. His imaginary hurt was quite forgotten—and once more his eyes wandered over the company.

He was thinking—but we knew not what.

Of the days that had passed? Of his jungle life? Probably not, for John so enjoys his present mode of living that when he was taken into the country to see what effect trees and flowers would have on him, he was frankly bored.

Was he thinking of the future? Possibly, for it was the subject on which we talked, and Miss Cunningham feels sure that John has a sense of understanding that is more than remarkable.

John Daniel II stands about three feet high, and weighs almost eighty pounds. His strength is tremendous, though he does not appreciate that fact. One of his forms of exercise is to grasp the mantel of the fireplace with one hand, and with the other, while swinging, lift a chair from the floor, holding it at arm's length. Quite a feat.

John is growing rapidly. In another couple of years his inherent strength will have become so great that it will not be safe for him to be at liberty. He may never mean to do harm, but his grip, his weight, will make it impossible for him to live in close contact with human creatures.

What will happen then? That is the question. If he is placed in a zoo he will surely die, for the gorilla is so temperamentally constituted that he must have companionship. The lack of this companionship, so scientists firmly believe, is the reason why no gorilla has lived in captivity up to this time. It was this lack of companionship that killed the first John Daniel.

"What I hope can be done," said Miss Cunningham, "is that a preserve can be built where John Daniel will be able to spend the rest of his life. A friend of mine, Mr. T. Alexander Barns, is at present in Africa, and one of the objects of his expedition is to try and capture a female gorilla who will be a mate to John. In the preserve Mr. and Mrs. John could live together and raise a family. It would be a great scientific study to watch the adult life of a gorilla. Remember John will not be full-grown until he is about eighteen or twenty."

Carl E. Akeley, who is probably the greatest authority on gorillas in the world, and who, of course, is vastly interested in Miss Cunningham's experiment, has pointed out in his recent book that the muscle of a gorilla is much more effective pound for pound than the muscle of a man. Also, Mr. Akeley points out, the gorilla in his natural state has far more mentality than the native man of the jungle.

On Mr. Akeley's most recent trip to the Congo one of his party shot an adult male gorilla. The physical proportions are interesting. To begin with, the beast weighed three hundred and sixty pounds. It was five feet seven and one-half inches tall, had a chest measurement of sixty-two inches, a reach of ninety-seven inches, the upper arm measured eighteen inches, and the calf of the leg fifteen and three-fourths inches. Contrast these figures with the measurements of a big man! When you consider how John will grow it can be readily understood that long before he attains his full maturity he must be banished from a hotel suite.

But in the meantime John Daniel is content to live his abnormal life, undoubtedly one of the most interesting visitors that this country has ever known—a scientific study that is without parallel in the world, for he is closer to man than any other beast—and of a higher grade of intelligence than many men now living.

"Now you must go to sleep, pretty boy," Miss Cunningham told him, and he allowed her to lay him down. But he did not sleep at once. The big eyes kept watch in the room, until finally he threw one hand over his head, while the other grasped an ankle. Then he rolled over.

Like a tired child John Daniel had been fighting sleep. But sleep had conquered.

Do the Scottish People Want Home Rule?

Some Reasons for Restoration of Edinburgh Parliament

By THOMAS C. TAYLOR

ARE the Clans to don the kilt and draw the claymore, and raise again the Lion Rampant, and once more put the Sassenach "over the Border"? Probably not, despite the fire and fury of the Scottish members when the Scottish Home Rule Bill was blocked in the House of Commons the other day.

There are two definite movements toward local self-government in Scotland at the present time. While the objective of these is similar in so far as the broad purpose is to have fuller administration of Scottish affairs placed in Scottish hands, there the similarity ends. One movement represents considered, responsible opinion which aims at the furtherance of industrial development and the common-sense utilization of Scottish resources, together with a more adequate safeguarding of cherished features of the national life and character.

Of the other movement, behind which has assembled a motley array of discontented elements, it must be said that as now sponsored and engineered it is merely an attempt to set up Scotland as a Socialist state.

In neither movement is there any such enmity toward England as would justify mention.

One need not hark back to the circumstances of the union of the Scottish and English Crowns in seeking for the causes of the present-day demand for Scottish Home Rule. Scotland has advanced and prospered as part of the United Kingdom, and has contributed in no small measure to the general strength of the whole and of the Empire of which the United Kingdom is the heart. Indeed, having regard to the long list of Scots who have risen to leadership in the political, social and commercial affairs of the United Kingdom, one can appreciate the joyful pean of an ousted Englishman who, writing from abroad, voices profound and unlimited gratitude that there is a prospect of the Scots now devoting their attention to governing themselves rather than governing England: "Scotties in government; Scotch executives in business; Scotch bosses in the factories! What about Home Rule *for England?*"

The efficiency resulting from the Scot's love of learning and reverence for culture, his willingness to make the utmost sacrifices for education, have certainly left an indelible impress upon the affairs of Great Britain; and, with it all, there has ever been kept keenly alive in Scotland the purpose to preserve unimpaired and unsullied the ancient founts of character and ideal. The land, then in the direst poverty, which, in face of an English offer of £30,000, kept secret the hiding-places of Bonnie Prince Charlie, is still in being. The country which produced David Livingstone is not yet barren of the type. There is a Scotland which would offer the Crown to a Barrie and ignore a Barnato. And it is to *that* Scotland one must look for the forces behind one of the movements for Scottish Home Rule.

Hindrances to Local Development

THAT there are flaws in the union arrangement, not necessarily involving separation from England as a remedy, has been borne in upon Scotland repeatedly, particularly during the past quarter of a century. It is doubtful if the union ever sustained a heavier jolt than it received, for example, at the time of the famous decision of the House of Lords in the dispute over the union of Scottish churches about twenty-five years ago.

The two great Scottish churches which decided to unite for more effective effort represented a very large section of Scotland's population, and the matter involved was one upon which, above all others, the Scot has always claimed freedom: a matter affecting his religion. Apart from the merits of the case, Scotland has by no means forgotten that by virtue of its loss of identity in the union the decision in this important matter came from a group of law lords predominantly English and regarded as unqualified to deal with a question so vitally, deeply and purely Scottish.

There have been minor jolts since then. There was grave dissatisfaction in Scotland, after the war, in the matter of the disposal of the National Relief Fund, to mention one instance only. The feeling that a "fair share of what was going," and adequate consideration of Scottish affairs, could not be obtained from London, has grown. The Scottish secretaryship was accorded a minor status, and the Scots girded at that, justifiably. In short, there slowly crystallized in the Scottish mind a conviction that the members of the partnership arrangement who yelled loudest obtained most, and the Scot did not see why he should have to yell for "his just due."

Responsible opinion in Scotland has been insistent that more informed and prompt attention should be paid to Scottish affairs and requirements. She has desired to retain and employ her people, and has pointed to undeveloped resources, power potentialities, road and other transport necessities; she has seen the best of her population shipped off to lands where there was opportunity and a living, while her own claims took a humble place in the long line awaiting disposal by an overburdened Parliament in London; and to all protests and appeals there came the reply that she already possessed a local government act under which her local requirements could be met. Despite the alleged efficiency of that local government act, however, Scotland has found that if she is to develop there is toll to be paid: and paid in London.

Schemes for local development, requiring provisional orders, are the prey of a ring of law specialists, through which ring requests for Parliamentary action must pass. There is some ground for the bitter comment often heard in Scotland that at every turn in her path of progress she has found herself up against a tangle of regulations and laws devised by lawyers for the benefit of lawyers.

To find that authority for a small local scheme designed to meet public necessities and confer public benefit could not be obtained without the initial expense of about $10,000 in fees to Parliamentary law-agents in London, with the risk of the scheme being rejected in London at the behest of the wire-pullers of big interests without regard for Scottish needs, has been the lot of many a Scottish venture. And every experience of that nature has turned the attention and the thoughts of still more responsible Scots to that ancient pile of buildings under the shadow of St. Giles in Edinburgh—Scotland's Parliament House, rich in national memories, and in an excellent state of repair; in fact, ready for use always, in its original capacity.

To the patriotic and cultural impulses animating the Home Rule movement which has attracted the best in Scotland, there must be added the stimulus born of experiences such as have been referred to in the foregoing. This particular movement has no interest in separation from England. It would preserve those things which have contributed to the upbuilding of Scottish character, and it would insure that affairs essentially Scottish be dealt with in Scotland by the Scottish people; but as for separation from England, one does not find in the movement any admission of such a necessity.

The second movement for Scottish Home Rule is of more forceful character. It is a growth of the large industrial areas. Behind it are masses who are really not Scottish; who represent the antithesis of what the Scot has become; and who have no knowledge of or interest in the culture and development of Scotland. Few of them are Scots of the second generation. To the leaders of those masses there has been presented the idea that now is the time to capture Scotland. Not for the Scottish people or the culture and progress of Scotland is the capture to be made, but for the application of an "ism." It is not a new movement, this second and more dangerous of the "drives" for self-government in Scotland; but it dates no farther back than a dozen years ago, and it has been very active indeed in its operations. Notwithstanding repeated efforts, it has failed to "absorb" the other movement, and has poured scorn upon it in consequence. It has assembled under a common banner the patriots of the "irreconcilable" type—a hardy remnant; the enthusiasts of various persuasions, each convinced that in the new state his view would prevail; the Laborist, who, with Scotland so largely Laborist in Parliamentary representation, sees no reason why Scotland should not be a Labor state; the Socialist, who, like all the others, has his own vision—a Socialist state; and the Bolshevik Communist, who represents the fact that Russia still regards Scotland's industrial masses as more Bolshevik than their parliamentary representatives, and is backing her opinion with money.

Within recent years there have been abundant evidences that thoughtful observers of Scottish affairs have viewed with alarm the departure of tens of thousands of Scots who would not tolerate the miserable conditions resulting from the effects of the war; who shook themselves free of the demoralization of a "dole" paid to intelligent and straight-thinking men who were fit to work and desired no more than the independence of living by their own efforts.

Changing Complexion of Scottish Labor

WITH even greater alarm there has been viewed the influx of people to take the places of emigrant Scots. As a member for some years of an industrial committee charged by the Ministry of Labor with the administration of "unemployment benefit" in a large Scottish area, the writer has first-hand experience of the amazing change in the character of applicants. The sturdy Scot who in the early days appeared as an applicant, shamefaced, driven by dire necessity, and openly cursing that necessity, was replaced in the later years by an applicant of different type, not anxious for work and resorting to all kinds of contemptible subterfuges to obtain the "dole"; for the Scot had "dropped into a job" of any kind at the very earliest opportunity, or had cleared out to other lands.

This change in the composition of Scotland's industrial population, important as it is, is not likely to prove the determining factor in any rearrangement which may be made of the country's relationship with England. The land is still sufficiently Scottish and the character of the general body of the people sufficiently true to type to warrant the belief that the Scot, in this matter of Home Rule for Socialism or kindred "isms," will do as he has always done when an ugly head popped up—hit it! He must first, of course, be stirred to an active interest in the matter.

It must be admitted, on the facts, that the possibility of a Labor administration in Scotland cannot be ruled out, should there be a change. Labor's showing at Westminster has created in Scotland a great and favorable impression. The view may be hazarded that since it came into its place of "power, with permission," at St. Stephen's, Labor has disappointed only the utter extremists and has gained greatly in the esteem of moderate Liberal electors.

Scotland's grievances, however, are capable of effective remedy. The demonstration which reduced the British House of Commons to hopeless disorder recently will have had valuable results if it arouses the British legislative body, as a whole, to the possibility of an independent Labor state to northward. The preservation of powerful and influential vested interests around Westminster may be regarded as too great a price to pay for that; and it is now certain that the claims of Scottish business will have more consideration in the House of Commons, and the remedies may not come too late.

It is worthy of note that one single street of Lower Manhattan can show more degradation and squalor than can be found in the whole of the largest of Scotland's industrial centers at this day. The Scot has decided, for the time being, that the blight that has fallen upon him must be wiped out at any cost, and Labor has the contract. Meantime, he pays his debts, even if he "kicks" at the exactions of English Parliamentary law agents and threatens to have Home Rule.

If Thomas Jefferson Were Alive Today

Concluded from page 9

His call for economy was a trumpet note:

"We must push Congress to the utmost in economizing."

"If we can prevent the government from wasting the labors of the people, under the pretense of taking care of them, they must become happy."

"A rigid economy of the public contributions, and absolute interdiction of all useless expenses, will go far toward keeping the government honest and unoppressive."

"The multiplication of public offices increase the expense beyond income, growth and entailment of a public debt, are indications soliciting the employment of the pruning knife."

Luxury taxes he favored. "The revenue on the consumption of foreign articles is paid cheerfully by those who can afford to add foreign luxuries to domestic comforts."

He took a decided stand against lynching. "It is more dangerous that even a guilty person should be punished without the forms of law, than that he should escape."

Good roads and other avenues of communication were desired. "I experience great satisfaction at seeing my country proceed to facilitate the intercommunications of its several parts, by opening rivers, canals and roads. How much more rational is this disposal of the public money than of waging war."

While he would favor these reforms, he would be outspoken against the growing influence of wealth in the affairs of government.

"What a cruel reflection that a rich country cannot long be a free one," he once declared.

"I hope we shall crush in its birth the aristocracy of our moneyed corporations, which dare already to challenge our government to a trial of strength and bid defiance to the laws of our country."

Opposition to centralization in government he often raised.

"It is not by the consolidation, or concentration of powers, but by their distribution, that good government is effected. Were not this great country already divided into states, that division must be made, that each might do for itself what concerns itself directly, and what it can so much better do than a distant authority. Every state is again divided into counties, each to take care of what lies within its local bounds; each county again into townships or wards, to manage minuter details; and every ward into farms to be governed by its individual proprietor. It is by this partition of cares, descending by gradation from general to particular, that the mass of human affairs may be best managed, for the good and prosperity of all."

The principles of government economy, which he advocated, made him an advocate of debt extinction.

"I place economy among the first and most important of republican virtues, and public debt as the greatest of dangers to be feared," he said.

"If we run into such debts as that, we must be taxed in our meat and in our drink, in our necessities and in our comforts, in our labors and our amusements, for our callings and our creeds, as the people of England are; our people, like them, must come to labor sixteen hours in the twenty-four, give the earnings of fifteen of these to the government for their debts and daily expenses."

Thomas Jefferson died nearly a century ago, but the doctrines he advocated make him live in this age.

He has asked to be remembered for three primary acts.

Not one concerned anything which the world had done for him. Each was a distinct service to mankind.

First on the list he placed his authorship of the Declaration of Independence. This document was written by him in eighteen days. Because he was not an orator, but was possessed of a voice that became husky when he spoke above an ordinary conversation, the defense of it was left to John Adams.

Next in importance, Jefferson placed his work for religious freedom.

Because of his faith in democracy he favored public education. No statesman of his rank in his day had such confidence in the people. John Adams had desired a representation "for the rich and well-born" and Roger Sherman had said that "the people immediately should have as little to do as may be about government." Hamilton, a member of Washington's Cabinet with Jefferson, had referred to the people as a "great beast."

Educational advancement was to be the last and greatest achievement of Jefferson's career.

The founding of the University of Virginia was authorized by the legislature in 1818 and the institution was located at Charlottesville, but a short distance from Monticello. Jefferson drew the plans, mapped out the courses of study, and watched the erection of its buildings from the porch of his plantation residence.

THE LIBRARY OF THE
UNIV OF ILLINOIS
URBANA ILL

BRIEFLY TOLD

"The International Jew," a four-volume series on the Jewish Question, may be obtained from The Dearborn Publishing Company, Dearborn, Michigan. This set includes:

"The International Jew," Vol. I, 235 pages; "Jewish Activities in the United States," Vol. II, 256 pages; "Jewish Influence on American Life," Vol. III, 256 pages; "Aspects of Jewish Power in the United States," Vol. IV, 246 pages. The price of these volumes is twenty-five cents each; the complete set, four volumes, one dollar.

An aerial camera has been developed that can photograph salient topographical features of land although the plane is completely out of sight of the ground.

The old German stork, with his black wings, white breast and red bill—the colors of the old German empire—is reported to be disappearing. They returned in numbers from Egypt to Germany each year, but since the war their numbers have decreased.

Fish are being studied as a possible source of insulin supply. Scientists hope that aquatic specimens may afford purer brand of the famed diabetes cure than is now obtained from mammals.

The people of the United States saved during 1923 more than they earned during 1890.

The total levies of general property taxes over the United States have increased 160 per cent in the ten-year period extending from 1912 to 1922.

The United States Department of Agriculture has produced a motion picture of the hidden foes in seed potatoes.

The commission formed by the federal central executive committee to commemorate the memory of Nikolai Lenin has forbidden the use of the former premier's portrait on jewelry, candy boxes, or other advertising forms.

Mine fields have been discovered in the Eastern Baltic off Finland. They are of Russian origin, dating from the World War.

Rollin Lynde Hart, writing in the *World's Work,* has this to say on the migration of the Negro north: "His children put on shoes. Instead of going to school three months in the year, they go nine months, and to a much better school. Besides, there is 'freedom'—a wretched enough substitute for actual freedom, but nevertheless exhilarating . . . . Now they think principally of their less fortunate brethren. To bring them north, to teach them, to civilize and uplift them, is their ambition."

The record price of $8,925 was recently paid in London for a set of colored prints representing Wheatley's thirteen "Cries of London." Last year a set realized $9,900 in New York.

In the absolute absence of light a cat could not see at all, no more than human beings, but her whiskers would enable her to feel her way about, while we use our hands in such circumstances.

Sir David Gill, noted Scottish astronomer, compared measuring the stars to measuring a three-penny bit two miles off. "Who but a Scotsman would care about a three-penny bit two miles away?" observed his chairman.

"Nations are only united as a rule when they are in conflict with other nations. If there is no foreign danger the natural pugnacity of peoples is excited by the mismanagement of their own internal affairs."—*The Irish Statesman.*

"The great weight of scientific opinion today is that alcohol is alcohol either in whisky or beer; and that the amount of alcohol consumed is actually greater where beer is the popular beverage than where it is not."—*British Columbia Prohibition Association.*

According to Stanley Baldwin, ex-Premier of Great Britain, the Englishman does not worry. Other nations, he declared. worry without grumbling: the Englishman grumbles without worrying.

An official report shows that there was one American visitor to Shakespeare's birthplace last year, to four British.

To a spectator on our nearest star, the sun and earth would represent a close double star, so comparatively near are the sun and the earth.

The imam of the mosque at Woking in London, addressing a meeting of Muslins, said: "You will become once again rulers of the world if you act according to the advice of the Holy Prophet, and 'trust in God, but tie your camel.'"

The "village smithy" in Saint Mary Cray, Kent, England, is being demolished to make way for a new broad street. The buildings are five hundred years old.

Among prominent New Yorkers who were born on farms are Judge Elbert H. Gary, Mayor Hylan, Police Commissioner Enright and Chauncey M. Depew.

Youngstown, Ohio, has moved its public library to the Public Square. It was a move of only four blocks but the theory is that the nearer the books, the more people will use them; besides, the "per-circulation" cost of operating the library soars and its social usefulness goes down.

In less than a year from the time insulin came into use for combating diabetes a prominent life insurance company is able to report a small, but probably significant, decline of 6.4 per cent in the death rate from that disease among its industrial policy holders.

More than twenty-five thousand women have been fined or sentenced to imprisonment for violating the National Prohibition law.

Natives of Central Africa in Kenya Colony clear farms by means of the hatchet and fire. This has destroyed much forest land as the farmer only uses his cleared patch twice before moving on to another forest. Forest officers are training the natives in the conservation of timber.

Magnets are used to clean clover seed at Cambridge, England. Magnetic powder is mixed with the dodder and seed and the metal sticks to the dodder which is lifted away from the clean seed.

Termites, white ants, of the tropics have an insatiable appetite for wooden structures, furniture, stores and fences. Railroads, in districts infested by termites, use metal or concrete ties to withstand the attacks of the insects.

American marines in Haiti are making intensive use of airplanes in carrying medicine, supplies, animals and mail to points difficult of access by highway and the sea.

Ten of the eleven state legislatures meeting this year have passed more than 4,000 new state laws.

CHRONICLER OF THE NEGLECTED TRUTH

Are You a "Mooch"?—Here Is Your Number

How Did They Sell You That Stock? You Can Pretty Nearly Judge by the Sales Method Used on You Whether the Stock Is Good

NORMAN E. BECK, Chief of the Division of Securities of the state of Ohio, better known as the blue-sky law enforcement officer, has struck terror among those who have been exploiting the public through the sale of worthless securities.

More than twenty-seven hundred licenses to sell securities in Ohio were revoked in 1923 by Beck, as compared with the largest previous yearly record of two hundred and seventy-three revocations. This effective enforcement of the Ohio blue-sky law did not come a day too soon.

Since the Armistice, Ohio victims of worthless security schemes have easily lost more than enough to liquidate the state and county debts, which were $30,143,000 and $95,385,000, respectively, in 1922. The entire harvest of the stock jobbers in these fat years would doubtless also have paid off a large proportion of the various municipal debts of $544,910,000.

The R. L. Dollings companies alone are said to have sold more than thirty million dollars' worth of securities in Ohio before they failed. This promotion included the funding of twenty-six subsidiaries through the sale of stock to the amount of *seventy-five million dollars* to more than *eighty thousand persons.*

Ohio Is the Favorite Field

THE failure of the Cleveland Discount Company, claimed to be the second biggest mortgage concern in the world, with resources of forty-two million dollars and eighteen thousand stockholders, precipitated much of the trouble for other dubious stock-selling ventures in Ohio. The public appetite for blue-sky securities palled after that. It was the turn of the market.

Ohioans also lost a tremendous amount in the L. R. Steel chain store group that failed in 1923. It represented about twenty million dollars.

However, the worst of the whole business, and the losses through them aggregated more than the several large bubbles, were the numerous one, two and three million dollar concerns who employed high-pressure stock-selling organizations to market their issues, although they were palpably weak sisters.

Beck once asked an officer of perhaps the largest rapid-fire stock-selling outfit in the country if he could point with pride to any concern they had served which was a real success. The man could not recall a single flourishing client.

Ohio has long been the favorite field of good, bad and indifferent stock salesmen because of its general prosperity and the surplus funds in the hands of every class of its people. Honest brokers say that Ohio absorbs more of their stocks and bonds for permanent investment than any other state. The crooks claimed it as their oyster.

The first millionaire west of the Alleghenies was a Longworth, of Cincinnati. The enterprise of Ohio people has been matched by their thrift. Ohio's first settlers came from New England and Pennsylvania, and later many industrious, frugal Germans came from overseas.

The interest of the rest of the country in Beck's good work should be heightened by the unpleasant fact that his house-cleaning has caused the pests that have been robbing Ohio people to flee to less vigilant communities. What Ohio has done should enable other regions to rid themselves of promiscuous thievery in the guise of stock selling.

California with its reputation for tolerant treatment of newcomers,its optimism and the known presence there of hundreds of thousands of retired mid-westerners with money, seems to have attracted more of the gentry Beck has forced out of Ohio than any other state. However, the rest of the country has also acquired its share of these hard-faced, fast-working adventurers.

Norman E. Beck, the blue-sky law policeman of Ohio, is a husky young man whose good nature does not obscure his force and energy. It is hard for shady characters to circumvent such a man. Beck is not a lawyer. The country is learning that the way to obtain results in public administration is to get men of action instead of old-fashioned lawyer-bureaucrats.

Nothing else that Governor Donahey has done is more creditable than his unflinching support of Beck in this very real enforcement of the blue-sky law. It is easy to envisage the hiatus Beck has caused among operators who imagined they had influence, but not one of them has been saved in that time-honored manner. Here is an illustration of the value in dollars and cents of an honest governor who can't be influenced by lobbying.

The crux of the whole problem of protecting people from the depredations of the fake stock operators is the elimination of the crooked, high-pressure salesmen who are adepts at seeking out and swindling people. Large blocks of promotion stocks simply cannot be marketed without the use of crews of these cunning parasites.

A high percentage of these high-pressure, one-call salesmen who maintain the structure of the worthless stock game are young Jews.

Beck has found the new amendment to the Ohio law requiring security salesmen to furnish a bond before obtaining a license the most effective weapon against the tricky salesman. Violation of the law is punishable as a felony.

The bond enables a recovery to be made where the salesman has misrepresented the proposition. Since deceit is the essence of the efforts of most of them, the value of the bond will be recognized at once. Few of them can qualify. Beck has the last word upon licensing them anyway.

Upon entering a banker's office one day Beck met a high-pressure stock salesman whom he recognized. Upon asking the banker about him he found the fellow was then going under an alias.

The managers of blue-sky stock-selling campaigns no longer have to train their high-pressure, one-call selling talent. There is always a floating supply of them in Chicago and New York that can be mobilized on short notice. Chicago is their principal rendezvous, since, like the yeggs, highwaymen and other criminals, they find the central location of "Chi" advantageous.

NORMAN E. BECK

Chief of the Division of Securities, State of Ohio

When producing business, these salesmen often have exorbitantly excessive incomes, for they obtain a ten or twelve per cent commission, plus all of the profitable cheating of their employer and their customers that they can do. However, it is "easy come, easy go," and they waste their earnings. Lack of funds sharpens their wits to invent methods that will infallibly pry money out of their "prospects."

How the Prospect Is "Worked"

LIKE other underworld characters, these high-pressure, one-call salesmen have coined a vocabulary of their own.

The easy victim of the high-pressure salesman is termed a "mooch."

Canvassing new prospects on a new deal is a "cold turkey" drive.

"Bird-dogs" are given a split of commissions for informing these salesmen of good prospects.

All sorts of knowing people are brought into this sort of connivance with these plunderers of unsuspecting people.

Beck has detected these high-pressure salesmen employing misrepresentations that will amaze honest people. The entire Chinese colony of one city was sold worthless stock upon the declaration that the gaudy certificates entitled their holders to full citizenship privileges.

Commissioner Beck says it is remarkable how often fake stock certificates are boldly headed with an American eagle or other device suggestive of the national arms to lend color to these lies about their official powers. As Dr. Samuel Johnson once said: patriotism is the last refuge of a scoundrel.

Small foreign shopkeepers by the thousands have been persuaded that stock certificates carry with them night watchman protection, insurance, exemption from taxation and municipal regulations.

A hot-blooded Italian trader who thirsted for the gore of someone was informed by one of these salesmen that the stock certificate would authorize him to use deadly weapons upon annoying people without molestation by the district attorney. This resulted in the deluded man committing a murder.

Perhaps the outstanding entity in the marketing of securities through the high-pressure, one-call system is the H. W. Dubiskie Company of Chicago whose Ohio license has been canceled by Beck. Dubiskie was formerly associated with Seargant, the genius who hit upon the scheme of training men to sell stocks by the one-call plan.

An interesting adjunct to Dubiskie's staff is his general counsel, Ex-Governor Adolph Olson Eberhart, of Minnesota. Think of the reaction of a naive prospect to the arguments of a stock salesman who can buttress his arguments by frequently referring to "The Governor."

The Dubiskie concern marketed a large issue of Davis Sewing Machine stock before its failure. Beck can recall but one Ohio client of Dubiskie's that is operating and it is not paying the promised dividends.

Bankers who have overloaned to sagging concerns frequently suggest to their borrowers that they make a public offering of stocks or bonds through the high-pressure selling campaign channel. Thus the bank loans are paid up, but the poor and ignorant portion of the public hold the bag.

"Reloaders" and "Rehashers"

BECK has sometimes found that local personages whose names would impress credulous people will go upon the directorates of companies selling stocks of dubious value. Investigation shows they have made but a nominal investment and for some reason known to themselves are lending their prestige to a confidence game.

Purchasers of stocks from these organizations later receive dignified communications announcing that they have been voted "rights" to buy a very limited amount of an additional issue of the securities of the company. Later a salesman calls and asks the stockholder to sign a document surrendering his rights because of the keen public demand for the new issue.

The rest of the transaction, known as a "reload," is usually easy since the "mooch" doesn't want someone else to profit from his opportunity to get in on the ground floor.

Dividend checks are often delivered by salesmen who utilize the feeling of confidence to "reload" the "mooch."

A "rehasher" follows up the successful reloader. He bursts in upon the "mooch" with the announcement that "I have good news; the office made a mistake, you are entitled to subscribe to more of the new stock."

Purchasers are often assured they can get their money out of their stock whenever they want it. Since these issues usually pay fantastic dividends as long as stock can be sold regardless of whether or not they are earned, this enables the salesmen to point out that after making the initial down payment the buyer can hoist himself by his bootstraps by meeting the later payments with dividend checks. Salesmen frequently claim the stock will soon sell at a tremendous advance in price and they gravely take written resale orders at fifty points advance so the customers can take their profits.

When the stocks sold to the "mooches" happen to have more or less of an intrinsic value, seldom anywhere near par, the salesmen usually trick their holders out of them.

Beck has discovered salesmen calling such shareholders over the phone, posing as the president of the issuing company. The stockholder is informed that the company is headed for disaster and the president, because of his personal interest in a few stockholders, is warning them in time to unload before the bad news is made public. The salesman then hustles around and trades the stockholder perfectly worthless stocks for holdings that may have some value.

Another private graft of these salesmen is to take good securities from customers at an agreed price in exchange for their dubious offerings. They sell these listed securities they have thus obtained at the usually higher New York Stock Exchange quotation, turn in the bargained price to their employers and pocket the difference.

The sales managers of these high-pressure stock-selling campaign crews have to wink at these peccadillos of their producers.

While the payment of unearned dividends out of capital is illegal, it is usually done by companies selling this type of securities as long as they can continue to market stock.

The American Finance Company of Ohio is charged with paying $140,009.30 in dividends in fifteen months when its operating loss was $49,440.31. The Dollings companies are alleged to have paid out $377,428 of unearned dividends.

Beck cannot recall a concern that has issued million-dollar and upward lots of stock that have transformed themselves from either moribund or untried ventures to profitable going concerns by the process. The only ones that continued were companies that were the result of years of steady growth under good management, who sold their stocks or bonds in a respectable manner and others who were consolidations of well-seasoned, profitable undertakings. However, age is not a guaranty. High-pressure outfits often seek out old, sickly concerns and market stock upon their glorious pasts.

The new or weak concerns that obtain large sums

Angelique of Gitche Gamme Isle

Heroic Winter Vigil of a Squaw on Lake Superior Rock—A True Indian Tale

By MERTON S. RICE

A bit of Gitche Gamme in the rock frame of Isle Royale.

LYING well toward the north shore of the beautiful waters of Lake Superior may be found the most fascinating and beautiful island, and group of islands, that grace any inland sea. Great towering rocks they are, that thrust up out of the cold depths of crystal waters, and hold aloft the green plumes of waning forests.

Gitche Gamme is fascinating everywhere, but nowhere does it seem so perfectly to combine all its wonders and glories as in the rocky fastnesses of Isle Royale. For long years the legends of the Indians have woven its history with strange stories that thrill all hearts to heroism.

Indian stories of great copper nuggets, from whose glistening sides they had hammered out spearheads and arrow-points, lured the earliest arriving white men to seek the source of this metal, and to make partially successful mining ventures, of which today the abandoned marks remain.

But nowhere in all the adventures in search of treasure is there a more thrilling tale than that of an Indian woman who lived in the earliest days of our knowledge of Isle Royale.

Angelique was the impure Indian name she bore, though her blood was unmixed. She was a child of the great north forest. There are still those living who remember the remarkable tests of strength she endured. In the early fifties and sixties the measure of human prowess in the woods was the ability to carry a pack. How far and how fast can you carry a hundred pounds on your back? The athletic contest of those days was a pack-carrying match up a steep hill. That a woman should qualify for such a match was somewhat distasteful to the big hard-shouldered men who thought they alone could bear the real burden of the trail.

At Marquette one day Angelique, with a pack of one hundred pounds of salt pork, easily outdistanced all competitors in a race up a steep hill. The chagrined men offered many excuses and explanations, all of which were accepted by the silent Indian woman, who only answered by suggesting that they start again, and this time carry two hundred pounds. There was no escape. Only one man succeeded in even arriving at the hill's crest, and he staggered into a faint there, while the powerful Angelique, far in the lead, went easily to her victory.

It was this wonderful physique and the native Indian instinct which fitted her to be the chief actor in what is doubtless the most outstanding story of endurance the big north lake country has produced.

Angelique married a Frenchman named Charles Mott. For a little time they lived the ordinary rough, healthy, outdoor life of woodsmen. In 1845, life, for them, was almost suddenly transformed into a grim romance, of which the world knows all too little, and out of which only genuine heroism could ever emerge.

The little schooner *Algonquin*, bearing some eastern men, lured into the north wilds by reports of rich copper properties, stopped at La Pointe and persuaded the two Motts to go with them. When the party landed on Isle Royale, the Indian woman wandered far along the shore, and found a large copper mass in the water. This at once led to the proposed plan for the two hardy folk of the woods to stake out the ground, and locate it for the speculators. The bargain was struck, Mr. Mott to receive $25.00 and Angelique Mott to receive $5.00 a month.

The schooner returned to the Sault with all on board, to arrange for provisions and preparation for a camp. Plans were made for provisioning the party from La Pointe. But all the available provisions were a half-barrel of flour (borrowed from the Mission), six pounds of poor butter, and a few beans. Upon the sure promise of a full supply of provisions in the immediate future, and that in three months a ship would call and return them to their home for the winter, the couple returned to the islands, and took up their quarters on what is now called Mott Island, one of the most beautiful gems of all the lovely cluster of islands along the main isle shore.

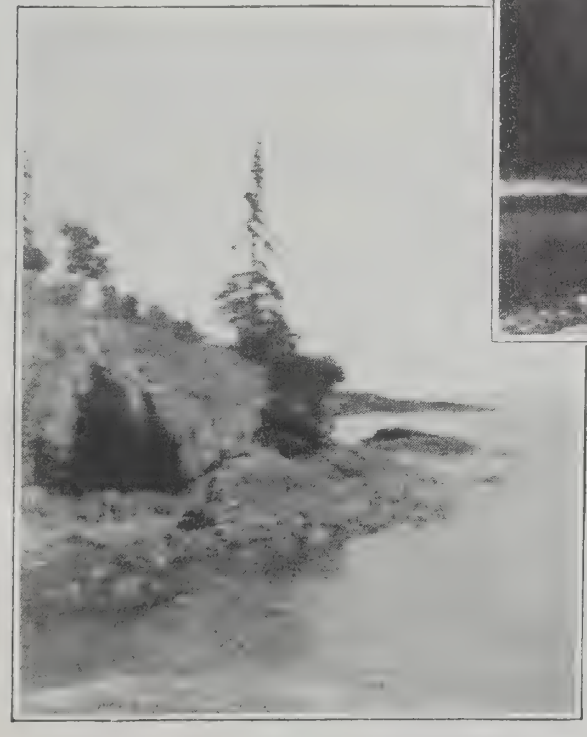
It was the first day of July, 1845, when that couple began their lonely vigil. They had a birch bark canoe and a small fish net. It was not difficult to obtain fish for food, while they waited the coming of their provisions. Everything they had brought with them had been consumed, when toward summer's end the storm-swept lake destroyed their canoe, and their little fish net was broken and useless.

The long-awaited boat still failed to come, and winter was in the offing. Winter does come in that region, and it is a long winter, and a hard one always. When best provisions are laid in, and every crack in the cabin is chinked, and well-gathered fuel is piled in easy reach, winter is still a hard challenge to endurance, and a lonesome battle with short days and long weary nights. Winter came in 1845 with every fierce meaning it could bring. Two forgotten humans met it with nothing but bravery and native instinct to fortify them for the fight. Everything they had brought to eat was gone before winter came and the cold whips of desperation cut their bodies, ill-fed on bark of trees, tender buds of young shrubs, and bitter native berries.

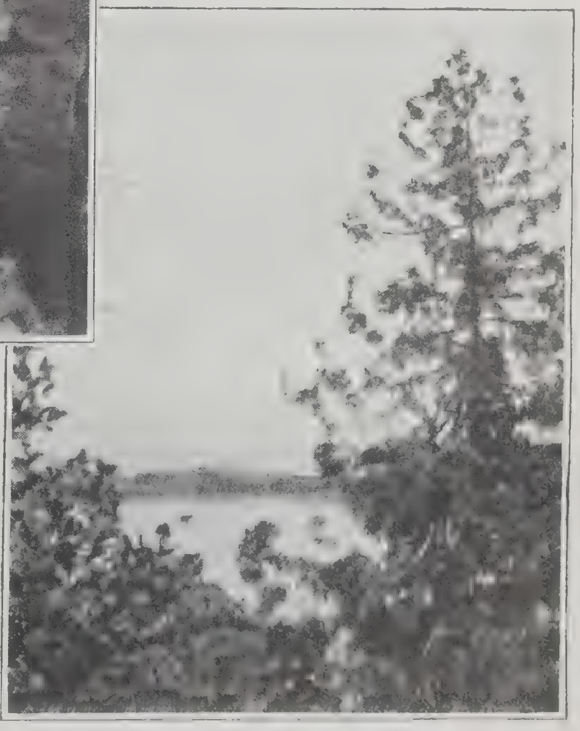
It required but a few weeks of such rigid testing to break the frailer body of the man, and Angelique Mott watched the slow collapse of her companion. Mott fell into a desperate fever which burned out his reason, as it more slowly burned away his life. The pitiful account which has been preserved as recorded by the tried woman is a story of suffering scarce equaled anywhere. She has written, as in a dreaded record, for fear it might not be understood, how her husband in the mad delirium of starvation's fever, seized the butcher knife and sharpened it, fixing his blazing eyes upon her as he talked of killing the sheep he must have for food. All day and all night, that powerful, but also starving woman sat watching that starving, desperate, fever-blasted and armed man, expecting him to spring upon her at any moment. At last she disarmed him, and in the exhaustion of his departing delirium he sank into a helplessness, and on into the stupor of death. Angelique has recorded, in her diary of the hard vigil, that in desperation she sought to dig holes about their log hut seeking food like a wild beast. But finding no roots she helplessly watched death relieve her husband at last, so gently that she did not know the moment of his going.

Then a new horror faced her. She had no way to bury him. The ground was frozen had she been able to find enough ground in which to dig a grave. But the solid rock formation of the islands made burial impossible. She could not stay in the cabin with the dead body. She set about the building of another hut in which she could find shelter. It was a difficult task, multiplied in difficulty by her weakness, but made possible by her desperation. She has written this for us to treasure: "Oh that fire! You don't know what company it was. It seemed alive, just like a person. It could almost talk, and many a time but for its bright and cheerful blaze that put some spirit into me, I think I would have died."

The weather-beaten shore of Mott Island, Isle Royale.



Nature plants her trees as close to the storm-washed edge of the rocks as they can stand.



From the northwest end of Mott Island, looking across a protected harbor to the wild sweep of Gitche Gamme.

The cold was terrible and the snow very deep. She did not fear the Mackee Monedo, for she had learned in a little Christian Mission to set her soul above the Indian superstitions. As starvation drove her farther and farther, she declared she had but one dread as within the range of her possible conduct. Yonder in that cabin lay the body of her beloved dead, and she remembered the cruel thoughts the delirium had driven into his soul, and prayed constantly that she might be saved from falling victim to them.

One morning in the snow before her door she found fresh tracks of rabbits. She tore from her head some strands of hair, and plaiting them she eagerly set them for a snare. The thought of actual food seemed to set her almost quenched life aflame again. That very day she was thrilled to find a rabbit caught in her snare. So ragingly hungry was she, she tore the skin from its warm flesh and ate it raw. It was a long week more before she caught another. So it continued, and though she had torn more than half the hair from her head to make more snares, never did she catch two rabbits at any one time. Days seemed like weeks. She could not sleep, and if she remained still, her spent muscles seemed to refuse to respond. So like a restless beast she walked to and fro in her prison. It was easier to walk than to do anything else. She walked, walked, walked. One day early in March a broken Indian canoe was tossed up on the shore, with which she busied herself in hope of making from some fragments of a clinging sail a rough fish net. As spring drew near the mullet began to swarm up the little streams to spawn, and thus offered a supply of food.

Early one morning in May, after she had had unusual success, and was cooking some fish, she was startled almost to a faint by the sharp report of a rifle. She left her coveted meal and started to run for the shore. Her knees gave way and she fell heavily. Another shot was heard, and she eagerly sprang again to her feet. A boat had arrived. The man who had abandoned them so many months before stood before her. "Where is Charlie?" The emaciated yet wonderful woman, pointing to the little hut, said, "Asleep." After endeavoring to explain their failure to relieve them, the body of the sacrificed man was buried as tenderly as the rough conditions would allow, and the most lonely vigil ever kept beside Gitche Gamme ended.

Angelique Mott died at Sault Ste. Marie in 1874, having written her name in the enduring terms, hardship and privation, and having left footprints of heroism on Isle Royale that will last as long as Indian tales are told around the fires.

A Half-Billion Dollars for Politics!

Campaigns and Elections Will Cost That Much This Year; Laws Have Failed to Curb Political Spending Evil: Earlv Beginnings

By ROBERT KENTON

FOR nearly a score of years the people of this country have wrestled sternly and perpetually with a problem that is as unsolved today as in the beginning. Commissions and committees have investigated it regularly. Almost innumerable statutes aiming at its solution have been enacted. Occasionally public opinion has risen wrathfully on account of some atrocious evidence of evil flowing from the problem and caused guilty public figures to be relegated in disgrace.

The problem is that having to do with "big spending" in or on political campaigns.

In 1920, the last Presidential election year, there was spent directly on politics in this country not less than $100,000,000. That is a moderate estimate. It does not include the public costs of the elections, which amounted to around $25,000,000 additional, indirect expenditures on candidates and campaigns, lost time, and energy deflected from other pursuits on account of thousands of persons dropping business wholly or partly to "whoop it up" for favorite candidates.

The expenditures on politics during this year will be much larger, unless the trend of the times is reversed—and of that there is no indication, for the cost of campaigning has been mounting with leaps and bounds for thirty years or more, mounting out of all proportion to other increased costs, such as that of living.

Including all costs it would not be wide of the mark to estimate the total outlay that will be made on politics in these free United States during this enlightened year of 1924 at not less than *a half-billion dollars!* It will be limited only by what those who wish to may be willing to spend, or rather by what the directors of most of the spending will be able to procure. And these directors—they now comprise a rather definite class of specialists in politics—are counting on its being a "good" year. For the material stakes were never before so large. Increase in the activities and prerogatives of government has been so tremendous during recent years that where only one person would have a tangible money interest in the issues of politics, five hundred persons now can visualize the results of elections in terms of dollars. And there is some indication that public opinion has about reached the conclusion that there is no way by which the evil can be curbed and is now more indifferent toward it than at any other recent time.

It is by no means a new problem. Since the advent of voting, efforts regularly have been made to use the force of sheer money in controlling or influencing elections.

Some "Offenders" of the Past

GEORGE WASHINGTON, for example, was not above distributing money, or what was tantamount, rather freely on campaigns or elections in which he was interested. In 1757, for instance, the then young Virginia leader recorded the fact that he had supplied a local electorate with "one hogshead and one barrel of punch, thirty-five gallons of wine and forty-three gallons of cider." It was the social custom for candidates to be generous. No corruptive intent accompanied it but its omission would have marked a candidate as lacking in the amenities.

During the following year there occurred in England the historic "spendthrift election" at Northampton when three noble lords, disputing as to who should occupy a single seat in Parliament, expended more than $2,500,000—at present values about $15,000,000. Two of the contestants, who were among the wealthiest men of the day, spent all they possessed. At that time and for long afterward reckless spending on elections reached stupendous heights in England. Even a man as virtuous as the great Wilberforce found it necessary to spend hugely on campaigns to remain in public life. One election to Parliament cost him nearly $100,000. The evil grew so atrocious in Great Britain that it became necessary to curb it with stern measures. The result is that in that country campaign spending now is regulated better than in any other. The way in which it is done will be told later.

Big spending on politics is a relatively modern phenomenon in America. The committee which directed Abraham Lincoln's first race for the Presidency spent less than $1,000, though the one which directed Lincoln's second race, in 1864, expended about $200,000. Lincoln himself spent almost nothing on his own campaigns. However, he was not opposed to using even his own funds; for it is of record that he personally paid the expenses of one impecunious delegate to the convention which nominated him the first time.

Before the last part of the last century, political spending in this country was almost entirely of local character. There were no huge national campaign funds and only occasionally big contributors. Money spent was used for more clearly corrupt purposes than that for which the bulk of political money is used in these days. It was employed chiefly in buying votes, at so much a vote, in stuffing election boxes with ballots cast by repeaters, in "colonizing" fraudulent voters—that is, by moving them from one state or community into another—in surrounding voting places with toughs to terrorize honest voters, and, to some extent, in subsidizing corrupt newspapers. Only a very small portion of the funds now spent on campaigns and elections goes for crass corruptions of this kind. In truth, most of it now is spent "legitimately," that is, technically within the law, though some and on the whole large sums in the aggregate still go for outright corruption.

The most enlightened political managers now agree that much better results can be procured from the spending of political funds on such items as posters, circulars, letters, spellbinding, active salaried workers, brass bands, newspaper advertising than in buying voters or editors or other individuals.

This kind of costly "legitimate" campaigning first came into vogue nationally during the eighties of the last century. Grant's race in 1868 was the first Presidential campaign that was heavily financed, but it is doubtful if the Republican National Committee spent on Grant as much as a half-million dollars. Some students credit Samuel J. Tilden with having first applied business methods to spending campaign funds. In his campaign for the Presidency in 1872 the first funds were raised by the "popular" methods now heard of so much during every Presidential year. But the Cleveland campaign of 1884 was the first to be financed in the "big business" way which since has been the rule with Presidential contests. A dozen men, including William C. Whitney, Oliver H. Payne, Levi P. Morton and William L. Scott, are supposed to have contributed not less than $1,000,000 to Cleveland's first campaign fund. Scott alone gave $250,000, which for many years was the largest single campaign contribution of record in this country. The first to exceed that was made by Thomas F. Ryan to the Parker fund in 1904. It amounted to $450,000. He testified later that $350,000 of this was given after it became certain that Parker could not win.

Ryan is one of the most royal givers to campaign funds in the country. In practically every Presidential fight of the last thirty years he gave $10,000 or more to the Democratic National Committee. In 1912 he gave "thirty thousand-odd dollars" to the Underwood pre-convention campaign fund.

Mark Hanna was the man who gave the Napoleonic touch to the raising of campaign funds. It is generally believed that he raised and expended more than $10,000,000 in electing McKinley in 1896. That was before the day of "campaign statements." The man who was treasurer of the Republican National Committee at that time stated in after years that only about $3,500,000 passed through his hands. It was in the same campaign that William Jennings Bryan caused the "dollar campaign fund" to be adopted. While the largest number of persons who, up to that time, had ever contributed to a campaign chest made gifts to it, the Bryan fund amounted to only five or six hundred thousand dollars.

Since 1896 both national committees of the big parties have put forth almost as much effort to increase the number of contributors as to increase the size of funds used in Presidential campaigns. However, neither one of them has depended on the small contributors for its "real" money. In fact, they have found that it costs nearly as much to receive, acknowledge and keep record of the dollar contribution as it is worth. But campaigning for contributions is one of the best ways of campaigning for votes. For by some odd psychology whenever one gives something, no matter how meager, to a campaign fund that person may be depended on to work hard for the success of the ticket thus "invested" in.

The largest number of contributors to any campaign fund probably was of those who gave to the Wilson fund in 1916. They numbered around 150,000 persons. The total fund amounted to $2,400,000; and, despite the large number of contributors to it, around seventy-five per cent of the total came from fewer than 500 big givers. In fact, fewer than a hundred men gave around $1,000,000 to the Wilson fund in 1916.

The largest campaign fund that has ever been reported was spent on behalf of Harding in 1920. Including the deficit, which later was paid off, this fund amounted to $9,700,700. The Democratic National Committee expended about $2,500,000.

While the funds raised by the national committees attract most attention, they constitute only a small percentage of the money spent on politics during a Presidential election year. These are the funds used only by the big committees in financing the campaign for only two offices, the Presidency and Vice-Presidency.

The voters this year, for example, will pass on contestants for not fewer than 10,000 offices. Virtually every one of these races will involve the spending of money, sometimes by party committees—of which there are many hundreds—sometimes only by the candidates, and usually by both. Then there are the friends of candidates who spend money independently, and organizations which are not political that do the same, often on a big scale.

Expenditures Increase as Laws Multiply

THEN the regular campaign is preceded in most instances by primary contests, in which the candidates are even more numerous, and, in many instances, the spending even more stupendous. In 1920 one man spent $750,000 of his own money on the pre-convention race of a candidate for the Presidency who lost in the convention. Another man spent about $200,000 on another futile primary fight. Two pre-convention Presidential candidacies cost more than $1,000,000 each in 1920.

Yet there are laws—stacks of them, in fact—limiting and regulating the spending of money in campaigns, primary as well as regular. Every state has them. Congress endeavored to limit the amount any candidate for a seat in the national legislature might expend in getting or trying to get the job. At least one-half of the force of this act was annulled by the Supreme Court when, in the Newberry case, it was held that Congress cannot legislate primary elections. Whether it still holds as to regular elections is doubtful. Even if it does, the law scarcely is worth the paper on which it is written. It provides no penalty for its violation. Moreover, it contains loopholes through which can pass virtually any sum of money anyone wishes to spend in a campaign. For the limit does not apply to "necessary personal expenses, incurred for himself alone, for travel and subsistence, stationery and postage, writing or printing (except in newspapers) and distributing letters, circulars and posters and for telegraph and telephone service." Incident to one or more of these exceptions a candidate may spend all the money he pleases on anything except newspaper advertising.

The law only requires the national committees to report the sources and the recipients of funds received by them but places no limit on what they may raise or how. When embarrassed by the law, the committee's managers need only hint to some good giver that he spend the money himself or through some other agency for all requirements as to making a report to be avoided. This ruse can be used, too, when it is desired that funds be spent in ways which the managers would not like to report.

In fact, practically all of our corrupt practices acts hold candidates and committees responsible only for funds spent "with their knowledge and consent," and only vaguely if at all do they make it an offense for others to spend funds without a beneficiary's knowledge and consent.

By reason of this provision practically all laws governing the giving and spending of campaign funds can be evaded more or less legally by any not too scrupulously ethical candidate or campaign manager.

The truth is that laws bearing on the subject have not curbed in the slightest the spending of money in campaigns. They have had some influence in changing the character of the spending, and perhaps have caused some who would give hugely with hungry eyes fixed on ends to be gained to refrain from using this route to political pull. On the whole, the laws have increased rather than reduced the volume of money spent in politics in this country. This is evidenced by the fact that the spending has increased as the laws have been multiplied.

The "Teeth" in the English Law

WHY have the British solved the problem and managed to regulate the evil fairly well?

Chiefly because their corrupt practices acts have "teeth" in them and are enforced. There are virtually no loopholes through which committees and candidates can escape. The party managers still have considerable leeway there in both receiving and disposing of contributions. But candidates are held to rigid accounting. Whenever a person announces for Parliament he must formally name an agent. Everyone who spends money on behalf of the candidate must make report to the agent. Thus the candidate is held responsible for all funds spent in his or her behalf. Questions having to do with the laws are handled exclusively by the courts. If a candidate is found to have violated the law, either personally or through his agent, he automatically becomes disqualified for the office sought.

Attempts have been made in this country to get rid of the campaign fund evil by having the expenses of campaigns paid from public treasuries. These have been even worse failures than the acts putting limits on spending by candidates and their managers. And these latter acts have been failures for the reason that usually they are filled with loopholes, and also because no general attempt ever has been made to apply what force they do contain. Only in the cases brought prominently before the public does anyone ever take serious notice of money spent in campaigns, either as to its source or its objective.

Recently, for instance, a Senate investigating committee sent for officials of the national committees of the big parties for the purpose of inquiring about contributions made in the last Presidential campaign.

Under the law, the information desired should have been and probably was on file in a public office almost within sight of the room where the investigators were sitting.

Disclosures as to certain contributions made quite a sensation. Yet those contributions had been of public record for from two to four years and nobody had paid the slightest attention to them.

Why do some persons of large means make large contributions to political campaign funds? Some no doubt do so out of unselfish impulse. The largest contributor to both of the Wilson campaign funds has rarely been heard of in connection with the government. He was a wealthy business man who became attached to Wilson while serving on the board of trustees of Princeton University when Wilson was president of that institution.

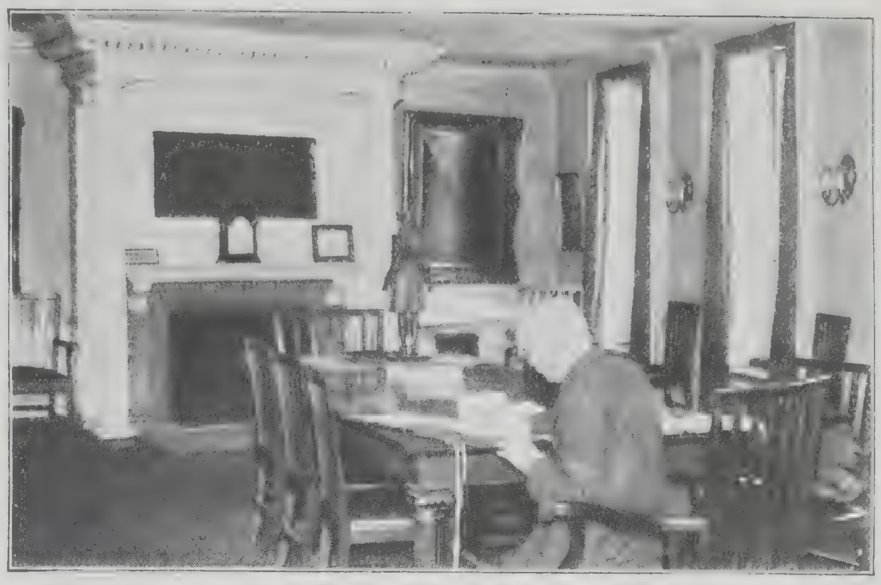
You usually will find, however, that "big givers" are remembered in some way by the parties to whose war chests they contribute. For example, *you won't find many men holding high places in the diplomatic service whose names do not occupy prominent place in lists of big givers.*

While the law forbids corporations to contribute to national campaign funds, any official of a corporation can do so. Both Mr. Sinclair and Mr. Doheny of oil fame were among the biggest contributors to the national campaign funds of recent years.

Fraunces Tavern

Historic Building in Old New York

By FRANK DORRANCE HOPLEY



"Long Room," Fraunces Tavern, in which General Washington took leave of his officers—now used as a writing room.

FRAUNCES TAVERN, at Pearl and Broad streets, New York City, has been for more than two hundred years an historic edifice. Today, but little altered from its original design, within the sound of the chimes of Trinity Church and the roar of the Stock Exchange, it still stands, a monument to the days of the American Revolution.

In the year 1686 the city council granted to Colonel Stephanus Van Cortlandt, three times mayor of New York, a "water lot" which was then known as the Strand. The rent was "one peppercorn to be paid every twenty-fifth of March—if demanded." On April 11, 1700, Mayor Van Cortlandt gave this lot, on which Fraunces Tavern now stands, to the husband of his daughter, Anne—Etienne de Lancey. It was not until 1719, however, that the new owner decided to build. The minutes of the Common Council of New York, under date of April 14 of that year, contained the notation:

> "Mr. de Lancey applies for a small strip of land to make his lot more regular in shape, as he is going to build a large, brick house."

The house was built, and the gracious and popular Mrs. de Lancey gave many receptions and entertainments there, to the delight of those who were fortunate enough to be favored with her invitations.

In 1730 De Lancey decided to build a new and larger house on Broadway, which had then become the center of fashion, and upon its completion the brick house on Pearl street was used for public gatherings. An old poster, dated 1737, of Henry Holt, a dancing master who had leased the place, announces that "a ball will be given in Mr. de Lancey's house."

Pantomimes were given in Holt's "Long Room," as it was called, in 1739, one of the first being "The Adventures of Harlequin and Scaramouch, or the Spaniard Trick'd."

As time went on the property passed into several hands, and in 1762 it was purchased by Samuel Fraunces, a West Indian, known to his friends as "Black Sam." He had been an innkeeper since 1755 and early in 1763 opened his new place, calling it "The Queen's Head Tavern." His first advertisement of the new inn appeared in the New York *Gazette* of April 4, 1763.

The tavern was named by Fraunces after Queen Charlotte, the young wife of George III who, it is said, was made queen of England because of an essay she had written on "The Horrors of War" and sent to Frederick the Great, then King of Prussia.

In those early days the tavern was the resort of patriots of all stations of society, and also of the liberals. The Social Club, one of the best known organizations of the day, composed of both liberals and patriots, met there every Saturday afternoon, until December, 1775, when its activities came to a sudden end.

Henry Russell Drowne, in his "Sketch of Fraunces Tavern," enumerates a number of important events which occurred at the tavern during the revolutionary days:

"On April 22, 1774, the Sons of Liberty and the Vigilance Committee met at Fraunces Tavern, and the result of the meeting was that an attack was made upon the ship *London* which had just arrived at the East India Company's wharf near by, and the tea chests in the cargo were broken open and the contents thrown overboard, for which "tea party" New York has received little credit.

"As the troubles between king and colonies became more and more serious and demonstrative, Fraunces Tavern was the headquarters of opposition to the crown and the favorite meeting place of the active patriots of those days.

"On May 14, 1774, in consequence of the news from England that the port of Boston was to be closed on June first, a meeting of the merchants assembled there to consider the question of uniting with the other colonies in a call for a congress of colonies. The attendance proved so great that an adjournment was made to the Merchants Coffee House, where a committee of correspondence, consisting of fifty merchants, was appointed. On May 23 they issued the famous letter in which the idea of a union of the colonies was first expressed, which resulted in the First Continental Congress.

"On August 25, 1774, the Massachusetts delegates to the Continental Congress were entertained by the New York delegates in the Chamber of the Royal Exchange, which was followed by a banquet in the 'Long Room' at Fraunces Tavern. This is referred to in the diary of John Adams as 'the most splendid dinner I ever saw; a profusion of rich dishes, etc.'

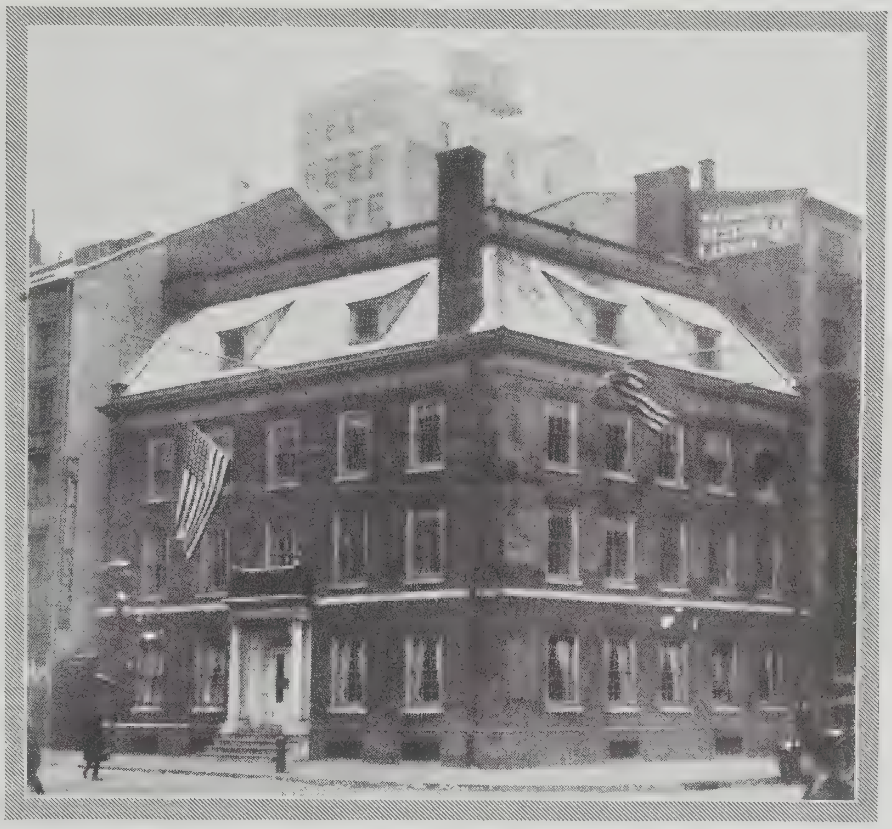
"On May 6, 1775, John Adams and the Massachusetts delegates to the Second Continental Congress stopped there overnight on their way to Philadelphia, when they were received with the greatest enthusiasm.

"On August 23, 1775, the building was struck by a shot from the British man-of-war *Asia,* and Philip Freneau made the occasion memorable in these lines:

"'Scarce a broadside
was ended 'till another began again—
By Jove! it was nothing but Fire away Flannigan.
Some thought him saluting his Sally's and Nancy's,
Till he drove a round shot through the roof of
Sam Francis.'"

A year later, the supply of lead running short, the window and sash weights of the tavern were taken and melted into bullets which were used to good account against the Tories.

During the occupation of the British, Fraunces Tavern was the scene of many orgies and meetings of the Tories to plot against the Colonists. One early writer speaks of the place as "The tavern near the ferry at which for seven years the officers of the British army, including poor John André, had glorified and drunk deep."



Fraunces Tavern, New York City.

At length, however, the patriots came into their own again, and Samuel Fraunces, who had joined the Colonial army to fight under General Putnam, once more took possession of the tavern. On November 25, 1783, Evacuation Day was celebrated there, and it was christened "Fraunces Tavern." The old sign, upon which was shown the head of Queen Charlotte, was thrown upon the rubbish heap.

At this dinner thirteen toasts were drunk, the first of which was: "The United States of America," and the last: "May the remembrance of this day be a lesson to princes."

Nine days later, on December 4, 1783, there occurred in the "Long Room" of Fraunces Tavern the most memorable scene it ever witnessed; that of Washington's farewell to his officers. One of those present has dramatically described it:

"The time now drew near when the Commander-in-Chief intended to leave this part of the country for his beloved retreat at Mount Vernon.

"On Tuesday, the 4th of December, it was made known to the officers then in New York that General Washington intended to commence his journey on that day. At twelve o'clock the officers repaired to Fraunces Tavern in Pearl street, where General Washington had appointed to meet them and to take his final leave of them. We had assembled but a few minutes when His Excellency entered the room. His emotions, too strong to be concealed, seemed to be reciprocated by every officer present.

"After partaking of a slight refreshment, in almost breathless silence the General filled his glass and turning to the officers, he said:

"'With a heart full of love and gratitude I now take leave of you. I most devoutly wish that your latter days may be as prosperous and happy as your former days have been glorious and honorable.'

"Afterward, General Washington said:

"'I cannot come to each of you, but I shall feel obliged if each of you will come and take me by the hand.'

"General Knox, being nearest to him, turned to the Commander-in-Chief who, suffused in tears, was incapable of utterance, and grasped his hand. Then they embraced each other in silence.

"In the same affectionate manner, every officer in the room marched up to, kissed, and parted with his General-in-Chief.

"Such a scene of sorrow and weeping I had never before witnessed and I hope may never be called upon to witness again. Indeed, it was too affecting to be of long continuance, for tears of deep sensibility filled every eye and the heart seemed so full that it was ready to burst from its wonted abode.

"A line of infantry was formed from the tavern to the ferry, and the General, with his officers following him, walked silently to the water. He stood up in the barge, taking off his hat and waving farewell. And his comrades remained bareheaded on the shore until their leader's boat was out of view."

In 1785 Samuel Fraunces sold the Tavern and retired to a farm in New Jersey, but in 1789 he became steward to President Washington at what was then the "White House," at No. 3 Cherry Street, New York City.

The story is told that one day Fraunces placed before the President a shad from the first catch of the season. Washington inquired the price, to which Fraunces replied, "Three dollars." Washington threw up his hands in horror. "Take it away," he commanded. "It shall never be said that the President of the United States indulges in luxuries so expensive as this."

On December 4, 1883, the hundredth anniversary of Washington's Farewell was celebrated in the "Long Room" at Fraunces Tavern, on which occasion the Society of the Sons of the Revolution was formally organized.

Fraunces Tavern has since passed into the possession of this society, and the building which had withstood so well the ravages of time and war has been restored as near like the original as possible. Mr. Drowne, in speaking of the restoration, says:

"The Broad street side had been made of yellow Dutch brick from Amsterdam and the Pearl street side of red English brick. Properly to replace and restore these two sides was a very serious problem, for no similar yellow brick could be found in this country, and it was only by good luck that it was ascertained that similar seventeenth century brick were being made near Rotterdam, and some fourteen thousand of them were imported in a great hurry from Holland, packed in cases, so as not to delay the work.

"As regards the red bricks, they were obtained from old houses being torn down in Baltimore, and were fortunately accessible just at that time.

"The original timbers were retained above and below the 'Long Room,' and every brick and piece of lumber was left in place. In the replacement, the ground floor and roof were made of steel and concrete, and the intermediate floors filled with ashes, to make the structure as nearly fireproof as possible. The fireplaces were restored so that the present appearance is practically the same as it was in the revolutionary period. The interior woodwork was modeled after that of the Philipse Manor House, now the Yonkers City Hall. The roof design was also adapted from this building, which had been built practically at about the same period by the same people, so that now the tavern can be revisited by the shades of the soldiers concerned in the 'great scene' that took place there on December 4, 1783."

Fire Rates Raised on the New York Kehillah

Unable to Bear Further Losses Through Incendiarism, Insurance Companies Advance Toll on Jewish Community

By CHARLES ALBERT COLLMAN

IN THE last ten years, the losses from fires in New York City have increased nearly 400 per cent. The estimated fire loss for the year 1922 is placed at $28,790,500. In 1913, the estimated loss was $7,467,997. John Kenlon, chief of the fire department, has exhausted speech in vain in warning of the constant increase in incendiarism. Arson rings and professional fire bugs boldly continue to widen the scope of their operations. This condition, according to the testimony of leading insurance experts, is due to the fact that the greater part of the fires in New York are in the clothing industry and its kindred trades. In these industries, more than in any other, the popular demand for certain styles of goods sway the trade. Manufacturers may make a fortune in a single season—or lose one. When the clothing contractor finds himself burdened with a certain line of goods that has proved to be unpopular and therefore unsalable, only too often that stock goes up in smoke.

Fire insurance companies in New York have for years vainly struggled against these conditions. The time came when they could no longer afford to pay the increasingly heavy insurance losses and survive. They found it necessary to protect themselves against those elements in the population which were shown annually to present the largest percentage of fire insurance claims. This step, long contemplated, has been taken. It was inevitable.

The New York Fire Insurance Exchange is the official insurance rating organization for the fire insurance companies of the city. Some mutual companies that do not belong to it nevertheless adopt the same rates that are decided upon by the exchange. Representatives of between ninety and one hundred insurance companies met in the rooms of the exchange, at 123 William street, on February 13, and at the conclusion of their meeting they announced that an increase of fifty cents on each $100 of insurance had been placed on policies covering risks in seven separate districts of New York City. The new rate applies only to the *upper East Side*, the *lower East Side, Williamsburg, Brownsville, Coney Island* and *East New York*. It was said at the exchange that these districts were not considered good risks and that underwriters did not care to write policies covering property in those parts of the city at the prevailing minimum rates.

The Districts Defined

IN THE official circular issued by the exchange, the seven districts discriminated against were delimited by giving their street boundaries. It was stated that outline maps of the territories described would be furnished to members as soon as practicable. It will be found that the seven districts as outlined by the exchange comprise the specific districts of the New York Kehillah, as officially determined by the Jewish Communal Register of New York City, bearing the dates 1917-1918, and edited and published by the Kehillah (Jewish Community) of New York City, at 356 Second avenue. On page eighty-three of the Communal Register, it is stated:

> "The city was divided into fifteen districts, each having approximately 100,000 Jews, and each district was further subdivided into neighborhoods of approximately 15,000 Jews. The following table, together with the accompanying map, show these divisions and their estimated population."

In quoting the official circular of the New York Fire Insurance Exchange, the districts as outlined by the Jewish Communal Register will be interpolated for purposes of comparison.

Circular No. 2407
NEW YORK FIRE INSURANCE EXCHANGE
(New York City Division, New York Fire Insurance Rating Organization)
123 William street.
New York, February 13, 1924.

SPECIAL RATES IN SPECIAL DISTRICTS DUE TO CONGESTED CONDITIONS.

At the regular monthly meeting of the New York Fire Insurance Exchange (New York City division, the New York fire insurance rating organization) held Wednesday, February 13, 1924, the following action was taken:

Voted, that on and after this date, in the territories outlined below, members be required to make at their counters an addition of fifty cents to the regular minimum rates for household furniture in brick apartment houses, frame apartment houses, brick stores-and-dwellings and frame stores-and-dwellings, and for stocks and other contents in risks of these classes; and also to the final card rates for contents of all specifically rated risks of these classes which are rated on either the general or the comprehensive schedule of the exchange (New York City division of the New York fire insurance rating organization).

The outlines of the special districts involved are as follows, the line in all cases going through the middle of the street named:

1. *Lower East Side District.*

Starting from the East River, following the line formed by James Slip, New Chambers street, Center street (to Duane), to Lafayette street, to Astor Place, to Third avenue, to East Fourteenth street, through East Fourteenth street to the East River and around the shore front to the Brooklyn Bridge, to the point of beginning.

(This comprises the Great Ghetto of New York. It includes District VIII, and District IX, of the New York Kehillah, as delimited in the Jewish Communal Register.)

2. *Upper East Side or Harlem District.*

Starting at the East River and East 96th street, west to Lexington avenue, north to East 97th street, west to Fifth avenue, north to East 120th street, east to 3rd avenue, north to the Harlem River.

(This is District IV of the New York Kehillah, as outlined in the Jewish Communal Register.)

3. *Bronx District No. 1.*

Starting at Webster avenue and East 168th street, north on Webster avenue to 174th street, east to Park avenue, north to East 175th street, east to Fulton avenue, south to East 170th street, west to 3rd avenue, south to East 168th street, west to Webster avenue, to point of beginning.

(This is District II, of the New York Kehillah, as outlined in the Jewish Communal Register.)

4. *Bronx District No. 2.*

Starting at Westchester and Jackson avenues, northeast on Westchester avenue to Tinton avenue, north to East 163rd street, east to Prospect avenue, north to Boston road, northeast to East 173rd street, east to Hoe avenue, south to Freeman street, southwest to Southern boulevard, southeast to Westchester avenue, southwest to Prospect avenue, southeast to East 149th street, west to Tinton avenue, northeast to 151st street, west to Jackson avenue, north to Westchester avenue, the point of beginning.

(This is District I of the New York Kehillah, as described in the Jewish Communal Register.)

5. *Williamsburg District.*

Starting from Broadway and Lorimer street, southwest on Lorimer street to Nostrand avenue, south to Myrtle avenue, east on Myrtle avenue to Lewis avenue, north on Lewis avenue to Broadway, southeast on Broadway to Belvidere street, through Belvidere street to Bushwick avenue, north to Flushing avenue, east to White street, north on White street to McKibben street, west to Bushwick avenue, north to Meserole street; west to Union avenue, north to Grand street, west to Driggs avenue, north to Metropolitan avenue, west to Berry street, south to South Fifth street, east to Union avenue, south to Broadway, southeast to Lorimer street, the point of beginning.

(This comprises District X and District XI of the New York Kehillah, according to the Jewish Communal Register.)

6. *Brownsville and East New York District.*

Starting at Atlantic avenue and Ralph avenue, south on Ralph avenue to East 98th street, southeast to Hegeman avenue, east to Van Sinderen avenue, south to Lorraine avenue, east to Wyona street, north to New Lots avenue, east to Essex street, north to Dumont avenue, west to Schenck avenue, north to Sutter avenue, west to Van Sinderen avenue, north to Atlantic avenue, west to Ralph avenue, the point of beginning.

(This comprises District XIII and District XIV of the New York Kehillah, according to the Jewish Communal Register.)

7. *Coney Island District.*

Starting at Ocean Parkway and Sheepshead Bay road, north along Ocean Parkway to Canal avenue, west on Canal avenue to West 37th street to Surf avenue, east on Surf avenue to West 17th street, north to Neptune avenue, east along Neptune avenue to Sheepshead Bay road, east along Sheepshead Bay road to Ocean Parkway, the point of beginning.

(This comprises District XV of the New York Kehillah. Far Rockaway and Coney Island lost their vogue as summer recreation and amusement centers since they became centers of Jewish population.)

250 Per cent Increase in Rates

THE extent to which the fire underwriters of New York have been driven to protect themselves may be gauged by the importance of the increase of fifty cents on every $100 of insurance in the areas described, a step which stands without parallel in the insurance annals of the city. The calculation of insurance rates is a complicated affair. We are now dealing only with base rates. The base rate on which an ordinary person pays a fire insurance premium in New York is twenty cents per $100 of insurance. To the base rate is added the physical hazard of a building, calculated on the safety of walls, the elevation of floors, and other conditions.

One of the officials of the exchange informed me that in the districts named, for a long time the majority of the insurance companies had refused to write any risks whatever. "Three or four companies," he said, "consented to write insurance in those areas, but at advanced rates of as much as one to two per cent. In other words, they charged from $1.20 to $2.20 on each $100 of insurance. The fire insurance companies of New York operate under the supervision of the New York State Insurance Department, and a ruling was had, which decided that there would be no discrimination if a uniform rate were adopted by all companies. Therefore the advance of fifty cents per $100 was determined upon. By adding fifty cents to the base rate, the persons in the delimited areas pay a rate of seventy cents per $100 of insurance, as against twenty cents paid in other sections of the city, or an increase of 250 per cent (two hundred and fifty per cent increase).

"It was found necessary to take this action primarily because of the great fire losses sustained in the clothing industry. In the territory covered by the exchange, there are 90,000 specifically rated risks. Now every month there is an average loss of $100,000 in the business of men's and women's apparel. In speaking of this trade, I am referring to the manufacturing end, to the apparel contractors, and not to the jobbers or retailers. One of these contractors puts out a line of samples and lays in a stock of goods. He may make a fortune, or he may go broke. Rather than suffer a loss, he is tempted to set fire to his stock.

"The handling of embroideries and laces is another risky trade, due to the fact that fashions change so quickly in that line. It also explains the large percentage of fire loss in that trade."

In the annual report of the fire department of the City of New York for the year ended 1921, Thomas P. Brophy, chief of the Bureau of Fire Investigation, reported 16,350 fires, an increase for the year of 1,712. Of these fires, 5,248 occurred in tenement houses. The arrests for arson totaled sixty-seven, and forty-seven persons were convicted of incendiarism. There were seventy-three incendiary fires and 313 fires of a suspicious character.

"The increase in incendiary fires," reported Mr. Brophy, "amounted to twenty-five per cent, while the number of arrests in connection therewith increased sixty-seven per cent. In fires in buildings, the increases were shown principally in business buildings. *The explanation for this is that during the year abnormal economic conditions prevailed. Manufacturers, jobbers and retailers found themselves caught with high-priced merchandise not readily salable. The bureau on numerous occasions acted in cases of suspected incendiaries, and while unable to proceed in a criminal action for want of evidence,* **was able to render aid in civil actions, and made it unprofitable for the commercial incendiary.**

"The substantial increase in so-called business fires made it necessary to give greater attention to fires of this type. The situation is serious, and is further aggravated by inadequacy of the force of the Bureau of Fire Investigation. In an effort to meet these conditions, investigators of the bureau have been working overtime, and a platoon system has been inaugurated which is designed to permit quicker investigation of fires. Under this arrangement, men trained in handling business fires are on the scene to observe conditions immediately on arrival of the firemen. This permits them to obtain first-hand information."

Methods of the "Fire Bugs"

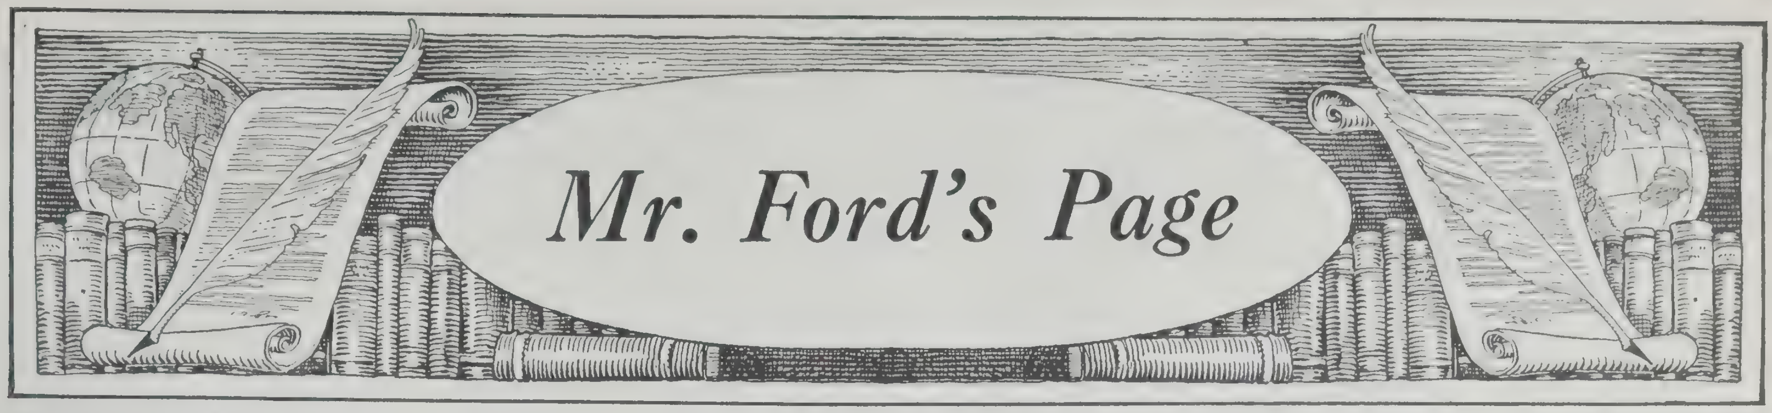
JOHN KENLON, chief of the department, in his report for 1920, stated: *"Business depression during the last half of the year 1920 seems to have played a very important part in sending up the fire loss.* We have had a very great increase in what are known as trade fires, namely:

Class of Business	Increase
Clothing (women's)	229%
Cloaks and suits	117%
Clothing (men's)	89%
Woolen and worsted goods	360%
Clothing (children's)	133%
Shirts	385%
Furnishings (women's and children's)	229%
Embroideries and laces	400%

The Bureau of Fire Investigation in 1919 reported: "One of the principal achievements of the bureau was the conviction of Benjamin Fleischer, who had organized and headed an expert band of fire bugs, and who was sentenced to not more than twenty years' imprisonment. Fleischer had been under suspicion by the bureau for several years, and under almost constant investigation. He specialized in commercial fires, principally paint stores, charging as high as $1,000 for setting a fire. The band had set fires in New Jersey, Connecticut and Northern New York. The scheme of the band was to have a merchant increase his stock on credit, and then double his insurance. Most of the stock would then be shipped to an auction room and sold, the fire bugs sharing in the proceeds. Next the depleted stock of goods would be set on fire by means of a 'time plant' to provide escape and alibis for the incendiaries."

Another conviction obtained by the Bureau of Fire Investigation was that of Hyman Stehr, a dry-goods merchant of 136 Attorney street, Manhattan. He was sentenced to not more than twenty years in Sing Sing Prison.

An incendiary fire had occurred in a dry-goods store in Brooklyn. When Isaac Stern, who occupied the store in partnership with Stehr, returned, he at first professed ignorance as to the origin of the fire. Later he admitted that he had left the store on the day of the fire with Israel Kessler, a professional fire bug. In a subsequent confession, Stern stated that he and Stehr had engaged Kessler to set the fire in the store for a fixed consideration. Kessler was caught, pleaded guilty to arson and was sent to Sing Sing. The conviction of Kessler and Stehr, one the active incendiary and the other the schemer or passive accomplice, resulted in the breaking up of one of the most dangerous gangs of fire bugs that had ever worked in New York City, and the subsequent suicide of another leader to escape prosecution.



Mr. Ford's Page

NO ONE can say, with the facts before him, that individual opportunity has dwindled in America. As was recently said on this page, the genius of our nation is to create opportunity, and we have always created more opportunity than we could fill. Although we opened for generations our gates to the whole world, and people from all lands flowed here in millions, yet there never came a decrease in opportunity.

These statements meet with dispute because something has occurred in this country. What is it that has occurred? Well, some people say that this has occurred—opportunity has become greatly diminished. There is a regular system of propaganda to that effect. Union leaders formerly preached that, though not so much now because too many union men have found for themselves that opportunity is just as plentiful as it ever was.

Nevertheless something has occurred to question the assertion that the United States is still solvent and wealthy in opportunity. The entire shift of emphasis from what is called individualism (a form of freedom) to what is called socialism (a form of servitude) is based on the assumption that all the sources are tapped now, all the opportunities taken, all the claims staked. So they call for a division on the present basis, which they would never do unless they believed that the present basis included the entire possible range of opportunity. They say, in fact, "We have reached the limit of things; as there are more people than there are opportunities, you who have the opportunities will have to divide."

This demand would represent a human duty if it were based on facts. If this earth has become something like a desert island on which we all are castaways, having so little of the necessities of life between us that regulation and division become necessary to prevent cannibalism, then the demand is right. But who would claim this, after looking at the earth? As well might a wandering group come up the road and claim equal interests on a well-tilled farm on the ground that the rest of the land was not cleared! The answer would be, "Go and clear your own farm; there's lots of land."

That is what has occurred in this country, not a decrease of opportunity, but a decrease of belief in opportunity, and consequently a decrease in the search for it. And the decrease has come mostly among those who incline to think of life as routine and not as adventure.

WITH continually more people and more jobs, there must be more opportunity in the world. If all claims had been staked, all sources taken, it might be time for a division on the present basis, but the world is still open territory to the progressive mind. Pioneers always see wide territory to occupy; plodders see only the dull round to be trodden. According to men's caliber they see or fail to see the continuance and increase of opportunity. Much depends, also, on people knowing what opportunity means; it doesn't mean a silver platter, it oftener means a spade. Self-help means something sterner than "help yourself"—reach over and take it. The Gospel of Plentiful Opportunity and the Gospel of Conquering Work are still true and dependable to any man who tries them.

There are always these two kinds of people in the world—those who pioneer and those who plod. The plodders always attack the pioneers, always say that the pioneers have gobbled up all the opportunity, when, as a plain matter of fact, the plodders would have nowhere to plod had not the pioneers first found the place. *The finders of opportunity are always finding it for someone else.*

Take a moment, this moment, to think about your work in the world. Did you make your place, or did someone make it for you? Did you start the work you are in, or did someone else? Have you ever found or made an opportunity for yourself, or are you the beneficiary of opportunity which others have made or found? And these others who found or made the opportunity—was it "luck," or "greed," or "selfishness" that led them to it, or was it alertness, industry and brains?

The chances are that the very job you are filling today was not known in the world twenty-five years ago. As an opportunity it has been as recently created as that. Yet twenty-five years ago men were preaching that all the opportunities had been discovered and must be divided up! Think of the immense number of new avenues of activity, new doors of achievement that have been opened in the last quarter century! Well, it has always been like that, and always will be. Men bewailed the disappearance of opportunity, and opportunities kept opening like volcanoes under their feet.

It would do no good to seize the opportunities that now exist, because others would be found immediately. The creative spirit cannot be caged. It is the true servant of the world. And life is so arranged that no benefit can be privately retained. No matter how rich a man may become in money, it is simply impossible for him to gather riches without distributing hundreds, yes and thousands of times as much as he is able to gather for himself. Opportunity simply cannot be fenced in nor in any way prohibited from exercising its benefits on all and sundry.

Perhaps a key to the difficulty is the wrong notion which many people have of opportunity. They think it is something that is nicely wrapped up and laid on their plate, something handed to them already finished. That kind of opportunity never existed—never! Opportunity is like every other valuable thing, obstructively present everywhere but waiting to be developed. The world teems with mineral wealth, but it must be digged for. The world teems with all the ideas that shall make and remake the future, from generation to generation, but they must be reached for.

There has been generated a temper of mind in our days which gives the lie to both these gospels: the gospel of the plentifulness of opportunity, and the gospel of the inevitable success of well-directed work. Those who do not believe in opportunity will still find places within the opportunities that others have created; those who cannot direct their work successfully will always find it possible to be directed by others. It only matters what class a man belongs in, and whether he has intelligence enough to find and recognize his place. He is a fool and a victim of fools, however, when he succumbs to the false gospel of No More Opportunity and the vicious gospel of Work Does No Good.

Because of the vast influx of minds that have been accustomed to the idea of government help instead of self-help, these two Gospels of America—the Gospel of Free Opportunity and the Gospel of Conquering Work—have been somewhat lost sight of. American-mindedness has given away somewhat to foreign-mindedness. But when we get back on those two main foundations, we shall be right again.

Self-help (the false brand) has come to mean something like "help yourself" at a well-filled table—just reaching out and taking it. Opportunity, because it does not lie about in clumps, like posies waiting to be plucked, is said not to exist. Self-help is said to be a delusion because it means something rather more severe than the colloquial "help yourself"—reaching out and taking it. "Self-help" is something stiffer, it may mean digging.

The self-helped man has a hard job. He has to think: there is no work harder than thinking: the majority question that statement because they do not think. He has to deny himself present desires to reach future goals: people want what they want when they want it; therefore they regard all self-discipline as hardship. He has to lay deep foundations for future growth: but people want shade-trees the first season and giant oaks in a single summer: they forget that as high as the branches spread in the air, so deep must the roots spread in the earth.

Self-help means alertness: people don't like to keep alert, they want someone to do it for them; they like to doze along in comfort. Alertness is part of the price, and those who prefer undisturbedness to alertness, can get it. Most of them do get it.

A volume of 452 pages, durably bound, containing 98 of these articles, under the title of "Ford Ideals," will be sent postpaid for $1.00.

3. Write clearly.

Tax Cut

A TAX bill has at last been agreed upon and signed by the President. It apparently is not the bill that either party wanted, it is the kind of bill that Mr. Mellon said was impossible and that the President himself half threatened not to approve, but nevertheless here it is—signed, sealed, delivered and in immediate effect. When the Mellon plan was first proposed, national finance was in some sort of understandable condition. But since that time all sorts of liberties have been taken with the public treasury so that for a time it looked as if instead of lowered tax-rates we should have higher rates than ever. It is by no means certain yet at just which end of the horn the nation will emerge, but the public will justify almost any financial maneuvering that gives them a taste of lower taxes.

The effect on business, as the President says, is bound to be good. It is impossible to calculate the cost to the nation of the bickering which delayed prompt action on this question after the country had been led to expect it immediately. But a revival will come with the lifting of unbusinesslike burdens from business. We have not yet learned in this country that it is business that is taxed, namely, the efforts and energies of men, instead of things.

But the effect upon plain citizens will also be very good, for it gives all payers of income tax, especially those who pay on the installment plan, as most do, an opportunity to cut their own taxes. Those who paid the first quarter will now have the pleasure of cutting in half their second quarterly payment and the following two installments by one-fourth each. This is a form of tax reduction which citizens do not often enjoy, and it will serve to teach as by an object lesson that the benefits as well as the burdens of government find their last contact with the plain citizen.

The removal of various surcharges on communication, beverages, commercial paper, and so forth, will also be welcome as the lifting of national annoyance from the daily routine of millions of people.

Altogether the tax is a move in the right direction and no one will be criticized for it. Due to the political manipulation in Congress, no one will receive partisan credit for it. The record will probably stand that Congress, in obedience to the will of the people, lowered taxes that had remained unnecessarily high for an unnecessarily long time after the war.

Japan's Note

DIPLOMACY is on the downgrade, if the note from the Japanese Government may be taken as evidence. The note neither states a basic principle nor makes correct use of the historic instances in which a principle is assumed. Besides, it exhibits the Japanese Government to have agreed at every turn with the position which the American Government had taken on Japanese exclusion.

The first point which the note makes is that exclusion on racial grounds is inconsistent with the United States' record in abolishing in 1912 the commercial treaty with Russia because of Russia's refusal to change her official attitude toward the Jews. It had become the practice of hosts of Russian Jews to repair to America, take citizenship in the United States under our lax laws, then hasten back to Russia and demand as American citizens what the Russian Government was not ready to give them as members of an anti-Russian group. It was the beginning of that immoral practice, now so common, of untrustworthy alien elements parading the world as American citizens and bringing the American name everywhere into disrepute. Russia refused to agree that American citizenship changed the principles of the Jew. Jews in the United States demanded that our Government punish Russia. Our Government investigated the Jewish Question in Russia, and invariably the official reports indicated that the Russian Government was doing its best with a most difficult question. James G. Blaine complained that Jews were turning the hospitality of the United States into a burden.

American common sense stood firm against the Jewish propaganda in this country until William Howard Taft became President. As a lawyer and a statesman he saw the preposterous character of the Jewish demands and withstood them, until by a large expenditure of money and a wholesale propagandizing of American public opinion by false information, the Jewish power in the United States succeeded in moving our government to break a treaty with a friendly nation—a nation whose confidence and aid was to be so sorely needed in the war which broke out two years later. The whole story may be read at pages 197-209 in "Jewish Activities in the United States," which is Volume Two of "The International Jew Series," issued by the Dearborn Publishing Company.

This is now recognized as one of the big mistakes our government committed under Jewish pressure, a further push of the Russian people into the maw of the monster Bolshevism, and the Japanese foreign office shows poor understanding of the situation in citing it as an argument in the present matter.

A second point made in the Japanese note is based upon the assimilability of the Japanese in the United States. While not saying so directly, the note allows it to be understood that the Japanese might be found to be perfectly assimilable, and that American judgment on the matter cannot be accepted because the period of Japanese immigration into the United States has been too short and the attitude of the American people toward the Japanese not sufficiently genial to be conducive to assimilation. The Jew openly declares that he will not be assimilated by America, it is one of his two or three cardinal principles: the Japanese Government is not so frank, but puts the burden of action and proof on the Americans.

Assimilation has two sides. Even the Japanese Government will agree that assimilation depends somewhat on the willingness of the larger group to assimilate. That this willingness with regard to the Japanese is not present in large sections of the American people is a fact that has profound bearing on the matter. Whether the Japs are willing to be assimilated and their government willing to have them assimilated, there is plenty of room to doubt; but there can be no doubt whatever as to the attitude of the Americans who would have to do the principal part of the work, namely, the actual assimilation. There are theorists, of course, who hold that the United States can assimilate anything and everything; they are, however, the people who move out of their neighborhoods when Jews or Negroes become too thick. They leave the actual work of assimilation to someone else. Well, that work has been passed around so much in this country that now a definite public opinion is forming with respect to it. Certainly this part of the Japanese note is neither outspoken nor convincing.

The third point deals with the "Gentleman's Agreement." This agreement did no honor to either nation. It was a backstairs arrangement which did not change the attitude of our Government in the least, nor yet the status of the Japanese. In that agreement the Japanese Government recognized and accepted (as in the present note it recognizes and accepts) the principle of exclusion as conceived in the United States. It is to the *publicity* of the matter that Japan objects. At best the agreement was a makeshift of a peculiarly shifty type, typically Oriental in its evasion of facts, and more degrading to Japan than any straightforward exclusion act could be. Its utter lack of basis in principle is shown by Japan's offer in the present note to limit Japanese immigration downward to quite inconsiderable figures. If this is not acceptance in principle of the exclusion tenet which the United States asserts in fact, only the diplomatic mind can say what else it is.

The Japanese Government has missed a rare opportunity to make a genuine contribution to the principles on which rest international relationships. Argument based upon two errors and a quibble is not commendable in any government. There is a right and a wrong in this question, and we are not prepared to say that the United States has found the absolute right of it, though it goes almost without saying that Japan certainly has not. This note will not increase Japanese prestige in the world, but will rather shadow it for a time.

Women's Clubs Again

NOT long ago THE DEARBORN INDEPENDENT issued a warning to members of women's organizations that attempts were being made to use them for purposes which they did not fully understand, and which, if they did understand, they would repudiate. In connection with these articles, American women should read the *Atlantic Monthly* for June in which George Madden Martin, the well-known authoress, writes on "American Women and Paternalism." It is replete with truth and wisdom. It distinguishes between means and ends. The danger in women's compulsion upon the Government is not in what they seek, but in the machinery they have been led to demand as an indispensable part of their object. But it is upon the average woman's lack of information that the article deals most luminously. We quote briefly:

"To instance: The General Federation of Women's Clubs is, at this moment of writing, behind the Sterling-Reed Bill. Yet of sixty individual members of clubs within the Federation, recently asked for their opinion on this measure with its proposed Federal assumption of what, up to now, in our national history, has been the duties of the States, fifty-three, by their own statements, never have heard of it.

"Herd instinct is as common to women as it is to men. The American woman not only is as gregarious as the American man—as is evidenced by her nationwide passion for group organization—but she, within her clubs and federations, is even more ready than, say, the male rotarian, optimist, booster, and so on, to accept leadership unquestioningly . . . .

"Relying upon our leaders, the mass of us organized women too often know little or nothing about the measures which we from time to time endorse. And as a woman's club member of thirty-one years' standing myself, I hold I've a right to an opinion.

" 'George,' in the person of the accredited male, has 'done it' for women through so many centuries that George today, as personified by our accredited women-leaders, is a change only in sex and personality. And often the immediate George, in the person of a local woman-chairman, who presents a measure or a cause to her club, is speaking at the instance of still another George, in the shape of a central or national board; or, again, at the request of some other organization . . . .

"Obediently and pliantly we women within our organizations thus endorse, apparently unaware that no thinking creature has a right to an opinion on any subject touching the public weal unless it rests on the best information to be had on the subject.

"Conceding to these accredited woman-leaders of ours this full understanding and consequent right to an opinion, why is it that they knock so constantly, and in our names, at Uncle Sam's door?"

Hysterics

DETROIT recently had a flurry over the "Peace Special." The things that should have been said about it were not said, because both friends and foes are too mealy-mouthed. But even when pacifists see fit to embark from the very lands that threaten war, to preach pacifism in this land which never threatens war, and even if their main purpose is not the one advertised, they have a right to speak. Free speech is for fools as well as for philosophers. There is less freedom of speech in America than anywhere else, because only the half-baked radicals avail themselves of it. Our best people do not avail themselves of this freedom. This nation will never know what free speech is until the Americans begin to speak.

By far the wisest and most charitable utterance in Detroit concerning the "Peace Special" was made by Gaius Glenn Atkins, D. D. Speaking of the peace party of women, he said:

"As to disarmament they are ahead of any safe public policy. Nations will not and ought not to disarm until we have an organized control of international relationships not now in sight. Even then the new machinery will have to show its power to take the place of armament in safeguarding national security before the nations will trust it. Here is an ideal toward which we may work but to press that ideal too soon or too hard is to challenge a sound instinct of national safety.

"The pledge to take no part in any future war is a matter for the conscience of the individual who has fully counted the cost of taking it. I myself would not take such a pledge nor advise another to take it. It limits future freedom of action in ways those who take it might bitterly regret, not for fear of punishment, but because they might have a new vision of duty. There are certain lines of duty that must be left open to the future."

The difficulty seems to be hysterics on both sides. And hysterics is one of the stigmata of Bolshevist reactions both negative and positive.

What the Northwest Farmer Thinks of His Job

Farming Can Be Made Profitable If Proper Methods Are Followed—PART II

THOSE who have read the foregoing part of this article, in the last number of THE DEARBORN INDEPENDENT, will remember that the Northwestern farmer has had an unusual chance to express himself on the conditions within his industry.

What we want to know is the individual farmer's opinion of his own business, as he sees it conducted by himself and his neighbors in his own community; and that interesting secret these quoted excerpts will reveal. Let us confine ourselves to the spring-wheat states of Minnesota, North and South Dakota, and Montana, although Minnesota is mainly a diversified-farming state, growing spring wheat as the principal crop only on its western border.

The letter which was selected as the best of all those submitted was written by a dairyman of Anoka County, in the central part of Minnesota, a man of public spirit, good education and keen mind. Among the methods of improvement he urged for his community were better dairying and co-operative marketing, and this is the way, in part, he expressed himself on these questions:

"We *do* agree with the statement that lack of knowledge is responsible for a large share of our troubles. We have had occasion to canvass our neighbors for such organizations as the new co-operative potato exchange and our cow-testing association, and it is astounding to discover how careless a large proportion of farmers are on matters that directly affect their own business, such as co-operative marketing, proper rations for dairy cows, and so forth.

"A very large majority of our farmers have been keeping scrub cattle for dairy purposes; feeding them as scrub cattle usually are fed; depending on clover and timothy, and creek or slough hay, for hay; and raising potatoes as a cash crop. Scrub cattle do not pay; potatoes have been a fizzle in yield, quality and price for four years; and clover will no longer grow to any extent.

"Our soil is light, the farms are small, and good dairy cattle and alfalfa hay offer us the only way out. And yet, last year only seventeen farmers in the entire county could be persuaded to take interest enough in improving their herds to join our cow-testing association.

"The county agent has been preaching alfalfa for ten years, and the state has an experimental farm here on which it has been proved conclusively that alfalfa will do well. In spite of all this, not one per cent of our farm land is in alfalfa today . . . .

"The man in the city, who has no more education and ambition to learn new methods than a large proportion of the farmers, is barely making a scanty living; and the farmer of the future, who is too lazy or too indifferent to get a fair education and follow up-to-date methods, will be fortunate to eke out an existence on the farm."

The letter which was selected as second best came from a farmer in Big Stone County, in the lower Red River Valley, on the Minnesota side. This man is a renter—evidently with a mighty good type of landlord—and he is getting ahead with diversified farming where nearly everyone else has been going behind with wheat. This is the personal experience he recounted to support his advocacy of the diversified-farming plan:

"Being born and raised in Iowa, I lived there until February, 1921. Having farmed four years there for myself, the year of 1920 came, and with it the scramble for high rent, and places were scarce at that. I lost out, as I would not pay the high rent. My brother also failed to rent a place, so we got together and decided to move to Minnesota and farm in partnership. We landed in Big Stone County, February, 1921.

"We had six head of horses, seven head of registered Shorthorn cattle, eight brood sows, about one-half line of farm machinery, household goods, and a little cash. We moved on a half-section of land. Being scared of wheat, we followed the Iowa style of diversified farming, and this is what it has done for me:

"I own a half interest in all our stock and equipment. We have today sixty head of cattle, forty being registered Shorthorns. With our autumn pigs and brood sows, we have more than one hundred head of hogs, twenty-six head of sheep, ten head of horses. To our farm machinery we have added about $3,000 more, including a tractor, separator and corn picker, with other small implements.

Sound System Successful

"OUR personal property is all paid for, we have no mortgage and owe no notes. When we buy, we pay cash, and I still have the same amount of cash I had when I landed here.

"We are living on a 450-acre farm now. We plant 150 acres to corn, 150 acres to small grain, and 150 acres to alfalfa and sweet clover for pasture and hay. We have a fine set of buildings, and everything is arranged to be fairly handy. Two hundred and forty acres of the land is fenced and cross-fenced.

"Of course, this is not a big thing. It is just what many others could have done, had they followed the diversified plan; but it is a great satisfaction to a man when he sees his next-door neighbor losing out raising wheat.

"That Henry Ford statement about farming being a wonderfully profitable work, or so many people couldn't hang on, I think is right. Not that I think the prices are fifty-fifty, when it comes to the poor prices you have to sell for and the high prices you have to pay when you buy. But if the people would try the diversified-farming plan and co-operate all they could, that would help greatly, and I hope that in the course of a short time there will be some change."

> Henry Ford in the book, "My Life and Work," devoted a few paragraphs to a discussion of the farming industry, and offered his opinion that farming is unprofitable largely because of the waste of energy, lack of proper equipment, and inefficiency of method on the average American farm. *The Farmer*, of St. Paul, Minn., quoted those passages from Mr. Ford's book and asked its readers for their opinion, assigning to them as a subject for discussion, "How the Farming Methods of My Community Can Be Improved."
>
> The response to this invitation was 275 letters from farmers in six states: Minnesota, North Dakota, South Dakota, Wisconsin, Montana and Iowa, in order of number of letters received. The classification of the opinions expressed in the letters was given in an article printed in last week's issue of THE DEARBORN INDEPENDENT.

Similar sentiments were expressed by another farmer in Polk County, Minnesota, in the northern part of the Red River Valley, when he wrote:

"The farming methods of my community can be improved by diversified farming. If, instead of trying to raise grain on the same land that has never seen a forkful of manure or a legume plant from ten to fifteen years, the farmer would seed sweet clover and pasture it for a few years, he would soon be able to raise grain and corn.

"If, instead of raising so much wheat, the farmer would raise just a few acres on soil that has been renewed with the raising of sweet clover or other legumes, he could raise as much wheat on those few acres as he could on a piece of old, worn-out land of about four times the size and at much less expense.

"It has been proved year after year that corn can be successfully raised in the Northwest. There is no grain better for stock, either in the form of fodder or ensilage.

"We can't depend on our city people to consume our surplus supply of wheat, nor should we depend upon the lawmakers to make us prosperous; but get busy ourselves, as the farmer must use brain as well as muscle."

A Farmer Who Disagreed

SHOWING its absolute fairness in the consideration of these letters, third place was given to a man who disagreed entirely with Mr. Ford—one of the ten per cent—and who made out the strongest case on that side of the question. This man also lives in the Red River Valley, but on the other side of the river, in Cass County, North Dakota. He is mainly a wheat farmer, diversifying with other crops and to a very limited extent with livestock—milking a few cows, mainly for home use, and raising a few turkeys. After showing in a really convincing way that he and most of the other farmers in his community do utilize their energy to advantage, and do use modern labor-saving machinery and equipment, and do farm as efficiently as possible in their own kind of farming, he concluded his letter with the following statement of his own results last year:

"I will take my own case and tell what my books show for last year. My 480 acres were cropped as follows: summer fallow, seventy-four acres; wheat, 125 acres; flax, fifty acres; oats for feed, fifty acres; winter rye, forty acres; corn for feed, thirty-five acres; potatoes, twenty acres; hay meadow, fifty-six acres; pasture, twenty acres; trees and buildings, ten acres. From these acreages I received the following returns:

125 acres wheat, 15 bushels an acre, 1,875 bushels; kept 375 bushels for seed; sold 1,500 bushels No. 1 Dark Northern at 98 cents a bushel—$1,470.

50 acres flax, 7 bushels an acre, 350 bushels; kept 50 bushels for seed; sold 300 bushels at $2.20 a bushel—$660.

40 acres winter rye, 15 bushels an acre, 600 bushels; sold at 46 cents a bushel—$276.

20 acres potatoes, 50 bushels clean, marketable potatoes an acre; in addition kept 600 bushels for seed and cow feed; sold 1,000 bushels at 21 cents a bushel—$210.

Sold 609 pounds of No. 1 dressed turkeys at 22 cents a pound—$134.

Sold all the cream we could spare—$150.

"I will now submit an itemized statement of expenditures and receipts to show just how we came out on the year's operations:

EXPENDITURES

Two hired men for 8 months	$ 800.00
One hired girl for 8 months	280.00
Two men shocking wheat 4¼ days at $3	25.50
Two men shocking rye 2 days	12.00
Two men shocking flax 2½ days	15.00
Two men shocking oats 2 days	12.00
One man shocking 35 acres corn at 85 cents an acre	29.75
Two men picking potatoes (1,600 bu.) at 5 cents a bushel	80.00
Threshing 1,875 bu. wheat at 20 cents a bu.	375.00
Threshing 600 bu. rye at 20 cents a bu.	120.00
Threshing 350 bu. flax at 30 cents a bu.	105.00
Threshing 1,000 bu. oats at 10 cents a bu.	100.00
1923 taxes	555.00
Groceries for the year	425.00
Gasoline, kerosene and wagon grease	95.00
Fuels, such as coal and wood	175.00
Hired help for the winter	120.00
Total expenditures	$3,324.25

RECEIPTS

Spring wheat sold	$1,470.00
Winter rye sold	276.00
Flax sold	660.00
Potatoes sold	210.00
Turkeys sold	134.00
Cream sold	150.00
Total receipts	$2,900.00

FINAL BALANCE

Total expenditures	$3,324.25
Total receipts	2,900.00
The year's loss	$ 424.25

"This statement is made from the 1923 season. The farm as it stands with stock and machinery should be worth $50,000. Evidently it is a mighty poor investment.

"I cannot see how the methods of farming can be improved in this community so as to enable the farmer to pay taxes and overhead expenses and a small interest on his investment. Labor and taxes are too high and farm products too low in proportion."

Just to show that opinions may differ, even among neighbors, here is a letter from another farmer in the same county, with an entirely different point of view:

"The farmers of my community, and of the entire Northwest, are facing the greatest financial crisis of the generation. Thousands have gone bankrupt and a large percentage are in a precarious position. Politicians and farm experts have suggested various remedies, but I believe the farmers must work out their own problems, or secure the services of competent men familiar with the conditions in the particular section.

"We must diversify. By diversification I do not mean to discontinue entirely the production of wheat and other allied cereals. If each farmer would gradually increase the acreage of corn, sweet clover, alfalfa, millet, buckwheat, soy beans, and similar crops, he would secure a larger net return and materially enrich the soil.

"In connection with these crops there should follow a gradual increase in the number of livestock to consume the added roughage and low-priced grains. By selling a few scrubs and purchasing a purebred heifer or sow, and with the use of purebred sires, in a few years a man can have a high-producing dairy herd, or a uniform herd of beef cattle and hogs that will market profitably.

"There are many minor causes of failure among the farmers, especially the tenant or renter class. One of these is lack of co-operation between tenant and landlord, causing discouragement and lack of interest on the part of the renter. A remedy for this is a contract for a number of years on the 'fifty-fifty' basis. This gives the renter an added incentive and a chance to forge ahead."

From Grand Forks County, in the northern part of the Red River Valley, on the North Dakota side, came this little history of agriculture—and its aftermath:

"Half a century ago the land in this community was of the richest quality for farming purposes; but because of the one-crop farming, all the nurture for that crop has been subtracted from the soil, without any being added. This land, to be made profitable once more, needs a complete diversification.

"This backward trend of the land has been going on for the last ten or fifteen years, but still the farmers have been unable to get out of the old rut of small-grain farming to begin diversification on a larger scale by raising feed and selling it indirectly in the form of livestock.

"The most profitable change in this community will be in livestock. There are a few farmers in this neighborhood who have begun a slow change into livestock, and those are the farmers who are making the greatest headway toward prosperity."

Traveling to the extreme southwestern part of the state—where it is pretty dry, and where official statistics prove that the chances for a paying wheat crop are less than in any other section of North Dakota—we have this very frank and honest and enlightening statement from Hettinger County:

Misplacing the Blame

"THIS community commenced to be settled in 1906 by people who filed on homesteads. The first few years a good crop was raised, consisting of wheat, flax, oats and barley. Since then most of the farmers have raised small grain, that is, have been seeding wheat year after year. Now most of us are down to bankruptcy and are putting the blame on the country, the bankers, and loan sharks, and are demanding that the government set the price on farm products, make cheap loans, and so forth.

"In my opinion, we have no complaint to offer, and no charges to make, except against ourselves, because a man with common sense can clearly see that this method of farming will break anyone sooner or later.

"I know from experience, which was costly, as a wheat farmer for fifteen years, that if I had not changed my farming methods five years ago I would not have a home now. Diversified farming helped me out, so now I have a comfortable home, with running water in the kitchen, in the hog pasture, and in the barn, all of which is supplied from my well by windmill.

"Diversified farming pays, and the land value will rise. Let the government alone, and also the bankers. They are not always working for their health, and are

(Concluded on page 14)

A current misconception is the one which has to do with the "disappearing" ranch.

The Disappearing Ranch

By MAX BENTLEY

"SINCE my boyhood," stated a distinguished Eastern visitor to Texas, in an interview, "I have associated the name Texas with the great outdoors, and particularly I have thought of it as the home of the large ranch over which one might ride a whole day without trespassing on another ranch.

"I find Texas filled with large cities, the highways crowded with high-power automobiles, and the countryside occupied by farms no larger than those of my own state. I have not seen one cowboy nor one horse. I am free to say—but I say it with regret because no one likes to surrender the tender illusions of boyhood—that Texas has disappointed me greatly, since the ranch has made way before the farm.

"Its passing makes me feel positively dejected. It was so truly an American institution, so uniquely an expression of a never-to-be-forgotten era in American history. Had I the ordering of our country's affairs, I would ordain that a few ranches be left—very large ones—if for nothing else, as a landmark, as a sentimental link, a sort of monument, between the industrial and artificial America which we occupy today and the most solid, the most natural, the most happy era of our development as a nation.

"I ask myself: Where is an increasingly urban people going to get its meat of the future? Is not Texas large enough to have reached a satisfactory stage of development without sacrificing the one great institution which set her apart as distinctive among the states of the Union?"

Since this Easterner is an average man, it may be assumed that many thousands may be entertaining the same opinion concerning the "disappearing" ranch.

What this man said has a curiously familiar ring. "Passing institutions" seems to be a touchstone of current sentimental thought, and among these current misconceptions is the one which has to do with the "disappearing" ranch. The two articles of this series are designed to correct that misconception. They were written after a visit to the largest ranch on this continent.

To the extent that he identified the American ranch as a landmark and an American institution, the Easterner stated a fact which cannot be denied. It may be said that the beginnings of ranching were given to us by the Spaniards, but its evolution has been ours. In the development of our national life there have been—for want of a better word—things which have come to express that life through its successive stages.

Where does the American ranch fit in? It came into our national life in the period beginning at the end of the covered wagon era. When the automobile came along it had survived firmly as an institution. It irresistibly obtrudes as the one great corner stone of that time. Moreover, while the blunderbuss is no more; while the Indian has passed from the scene and the covered wagon is passing as the frontier shrinks, the ranch remains. It is *not* disappearing.

Ranch! There is magic in the very word—so potent as to have given the ranch a literature of its own. The Anglo-Saxon has ever pushed onward. The frontier has ever represented his pot of gold at the rainbow's end. The ranch has pushed on with him, likewise seeking the frontier. It has been the last American institution (or at least one of the last) to bow before expansion. But bowing, it has not stepped aside. It has merely accommodated itself to a general changing order. It *is* a corner stone and has so remained, changed, it is true, but still with us. May it ever be so!

As a frontier industry ranching has had its place in the economy of the pioneer peoples of both the United States and Mexico. In this country, as emigration moved westward, the ranch was out in front, carrying the torch, lighting the way for the farmer pushing out from the Atlantic seaboard. It preceded him to Texas. There it met and blended with Mexican ranching, and, after the Civil War, pushed northward across the Staked Plains out of Texas, until it occupied most of the plains area to the Canadian line.

The northward movement was accomplished swiftly. Westward it encountered another ranching era that had developed around the Spanish settlements in California and New Mexico. It spread northward and eastward until it claimed even the mountain peaks on the eastern slope of the Rockies. As the line of exploration moved westward and southward, the ranch gradually returned to its natural home—the border land—and there, along what now, generally speaking, constitutes the rim of the nation, one will still find it, vast as of old, but operated in a manner that would open the eyes of the old-time cowman, could he but return.

Increase in the population and the fertility of the Middle Western plains forced the cowman to draw in his horns; but his retreat has not, as so many assume, marked the passing of ranching as an industry. He has merely yielded to the farmer that which is naturally the farmer's, and retired his herds to lands unsuited to agriculture. The very causes that make them of little value to the farmer, such as infrequent rains and hardness of soil, have been of distinct value to the cowman. Cattle suffer from continued dampness, and rank and dangerous plants flourish in soft soil. Animal diseases and parasites are more difficult to control in a humid climate, while the thick, tough grasses of rainy growth are neither nourishing nor palatable.

From a national point of view, there has never been conflict between the cowman and farmer. There is room enough for both. The land area of the United States is, roughly, two billion acres, of which 745 million acres, or thirty-seven per cent, is range land and unimproved pasture; and forty million acres, or two per cent, is desert not yet grazed. We have 600 million acres of forest and woodland of which two-thirds is suited to grazing—so that when you think of the ranch as "disappearing," think also of 1,145 million acres of grazing land in the United States, comprising nearly sixty per cent of the land area of the country. Contrast this total with the area in farms, 478 million acres, twenty-five per cent. *Are* we an outdoor people? Cities, towns and populated areas immediately contiguous to them use only two per cent of our land area.

The ranch house was built on a hill and its Moorish-Spanish facade dominates the flat flower-carpeted landscape for miles around.

Speak of the ranch and the map of Texas pops into the mind. Why not? They go together. Freedom and bigness apply equally to the one as to the other. Texas is this big: It claims everything between the twenty-sixth and thirty-seventh parallels and between the ninety-fourth and one hundred and seventh meridians. From western to eastern boundaries is 900 miles. Brownsville, the farthest southern town, is 1,000 miles by train from Texline, the farthest northern town. Texas is so big that nobody laughed when the worthy Brownsville citizen returned earlier than expected from a sojourn in the city of Dallas, in North Texas, with the bitter explanation that "I never could stand those Yankees, anyway."

By reason of its size, the extent of its semi-arid territory suited to ranching and not to farming, and its nearness to Mexico, Texas has ever been the cowman's natural habitat. He has had elbow room. Texas is so comparatively new as a state that land is still cheap. While it is the leading agricultural state of the Union in the value of its farm products, seventy-four per cent of its total land area of 168 million acres is devoted to ranching, while only nineteen per cent is in farms.

Before the introduction of the barbed-wire fence, during the free grass and leased range eras, every range animal that wore horns—steer, bull or yearling—was a cow. He, the cow, was an unlovely creature, but his owner canonized him. Since he was sold per age and not per pound, his weight was a matter of small concern. If he could grow horns of goodly sweep he was a fine cow; if they attained a sweep of seven or eight feet, he was, as I have said, canonized. A short time ago I attended a convention in a Western Texas cow town. The governor of the state headed the grand street parade. The fact that the executive rode in a luxurious limousine was given only casual attention. What drew the wild huzzas from the crowd was a set of spreading cow horns fastened on the front of the machine. The owner of the horns keeps them in a dark, hidden retreat, exhibiting them only on state occasions before an audience which—he knows in advance—will be properly appreciative.

It is a long cry from the generic cow to the purebred stock raised on the twentieth century ranch. Even so celebrated a cowman as the late Captain Richard King, of Texas, did not fully grasp the possibilities waiting on the raising of high-grade animals. When he died, in 1885, he left a ranch of 300,000 acres over which roamed 50,000 head of cattle; but his stock was haphazard, longhorn-bred. Captain King's ranch (a series of loosely connected ranches is what he had) lay in the southwestern portion of Texas, in the territory over which the United States and Mexico went to war. He never believed in nor practiced the free-grass theory, but inclosed his large holdings in wooden fences. He bought outright neighboring ranches from the holders of governmental grants, and thus held title securely through the transition from free grass to leased range, and on to the fee simple era. As a result of his foresight, the King ranch, instead of being cut to bits as were the early ranches on the Staked Plains, has passed intact to his heirs, and today, instead of comprising the original 300,000 acres, occupies a ducal domain of more than one million acres. It is not merely the largest ranch on this continent; it covers one-half of one per cent of the area of Texas!

The King ranch lies in a pleasant land, the valley of the Rio Grande, broad and level. Eastward it runs to the Gulf of Mexico. Westward the Rio Grande divides it from Mexico, but the division is ethnogenic only. There has not been merely a blend of traits of two peoples; the Mexican has actually effected a successful invasion.

The Mexican invasion has not been confined to temperament and habits. It has extended into the realm of the biological. Fifty years ago the Rio Grande valley was treeless; today its wooded area is more extensive than the prairie. Its arid climate has reduced tree growth to shrubs, but the pigmy Mexican forest, led by the Sonoran mesquite, has resolutely pushed on, flourishing on alien soil where the great Atlantic forest, approaching it from the north and east, has faltered and broken on the dry Texas plain.

It was in this background that Captain Richard King, commencing as a youth, laid the understructure for what has come to be the largest ranch in America. What the King ranch looks like, what has been accomplished there on an unheard-of scale by those who succeeded him to its control, and the future of ranching as seen by the present general manager of the King properties, will be taken up in the concluding article of this series.

Grafters Buy Two States

Corrupt Deal Annulled But the Courts Upheld It and Claimants Were Indemnified—PART II

By AARON HARDY ULM

IT IS a curious side light on the history of this country that few persons guilty of political corruption ever have been sent to prison. Though in few countries has so much corruption been exposed—not necessarily because there has been more of it in the United States but perhaps on account of energetic facilities of exposure—one has to search widely for cases that ended in the application of legal punishment. A few officeholders have been impeached and officially disgraced, an occasional municipal boss, like Tweed, of New York, and Abe Ruef, of San Francisco, have been imprisoned. But the record of the past indicates that the political corruptionist, no matter how atrocious or well exposed his crimes, runs mighty little risk of being required to make the sort of atonement that is called by the laws.

These conclusions apply to the first, and still in many respects the greatest, single case of public corruption recorded in our annals, that known as the Yazoo Fraud and partly told of in a former article.

Insofar as the writer can discover, not one of the guilty persons was so much as brought to trial; not one spent a day in jail, and not one was so much as forced to surrender money procured by means of criminal acts connected with the fraud. History even makes no marks against the names of several very prominent persons who were involved in the crimes.

Were Bought Like Cattle

YET many of the most culpable ones were punished, and severely. This punishment was applied, however, by the lash of public opinion, with the exception of perhaps one case in which mob law was applied tragically.

Yet old records still in existence supply data showing the commission of most arrant crimes by numerous persons.

One reliable author who wrote of the events not long after they occurred described as follows the scenes attending the corrupting of a legislative body by bold schemers:

"In the lobbies of the House and Senate alternately were to be seen a judge of the United States Supreme Court, from Pennsylvania, with $25,000 in his hands, it was said, for cash payments; a judge of the district court of the United States, from Georgia, passing off shares of land to members for their votes, and a Senator from Georgia . . . . bullying and in turn cajoling the numerous understrappers in speculation. There was also to be seen a judge of the Superior Courts and other eminent Georgians . . . . South Carolina also was represented by one who was regarded as the prince of speculators . . . ."

Affidavits made later showed that legislative members had been bought like cattle, cash prices ranging from $600 to $12,000. A few even were paid in human flesh, some receiving only one and others "eight or ten" Negro slaves in return for votes. Most of them, however, accepted shares in the companies for which the bribes were paid.

But when it became generally known that nearly 50,000,000 acres of rich public land had been thus purchased for a pittance, an expression of terrific public wrath went up. This came, however, chiefly from the masses; the rich and powerful, with few exceptions, took the side of the grafters.

"You will break down confidence in the new government," said they to those who denounced the proceedings.

Thus the masses backed up the indomitable James Jackson, who resigned from the United States Senate and returned to Georgia for the purpose of warring on those who were responsible for the corrupt deal. He was elected to the legislature from his home county, Chatham.

A Curio of Legislation

HE DECLARED that the sale was fraudulent, and caused the succeeding legislature to cancel it. The repeal bill directed that all record of the sales act be stricken from the legislature's journal. The measure is a curio of legislation because of the provisions made therein for disposing of the original bill authorizing the sale of the vast area of public land. This part is well worth reproducing, as follows:

> "A fire shall be made in front of the State House door and a line be formed by the members of both branches around same. The secretary of state (or his deputy) with the committee shall then produce the enrolled bill and usurped act from among the archives of the state, and deliver the same to the president of the Senate, who shall examine same, and shall then deliver the same to the speaker of the House of Representatives for like examination; and the speaker shall then deliver them to the clerk of the House of Representatives, who shall read aloud the title of the same, and then shall deliver them to the messenger of the House, who shall then pronounce:—'God save the State! And long preserve her rights! And may every attempt to injure them perish as these corrupt acts now do!'"

Then, the bill provided, the documents were to be cast into the flames.

Tradition says that the ceremonial was made more picturesque by the blaze being started by "fire from heaven" drawn through a sun glass. This, however, is believed to be mere legend.

With such ceremony, Georgia made official renunciation of an act which for picturesque if not far-reaching corruption exceeds any other of the kind which has occurred in this country.

But the burning of the fraudulent acts and the purging of the records did not bring an end to the speculators' operations.

Even while James Jackson was causing the corrupt sale to be declared null and void, the promoters of the scheme were busy in other sections of the country selling shares of stock in their companies. These shares were based on acreage, which were sold in big lots at prices far beyond what had been paid to the state of Georgia. A fever of speculation in the shares, like those produced in Europe long before by the South Sea bubble, raged in many parts of the country.

"On this ocean of speculation," says one writer, "great multitudes of sober, industrious people launched the earnings of their lives."

The companies' activities were particularly prominent in New England. Bostonians alone invested more than two million dollars in them.

The promoters contended that, whether fraudulently or legitimately procured, they had a legal deed to the property; and this view was upheld many years later by the Supreme Court of the United States.

Later controversy having to do with the affair centered almost wholly at the national capital.

For a few years later, the Federal Government took over the territory involved, paying the state of Georgia $1,500,000 for it. It was opened to settlement, which led to the organization of the states of Alabama and Mississippi.

The claimants under the grant which Georgia had annulled pressed on Congress demands for indemnification.

These were opposed by James Jackson, who, following a term as governor of Georgia, returned to the United States Senate, and by John Randolph, who equaled Jackson in violent denunciations of the operations.

The subject was an unending one of agitation for nearly a score of years and was the source of frequent scandal at the national capital, where perpetual lobbies were maintained for many years by the claimants. Money was spent so freely at the national capital that Randolph on occasion exclaimed:

"They buy and sell corruption in the gross, and a few millions, more or less, is hardly felt in the account."

Nobody Legally Punished

SO LONG as Randolph and Jackson were on the job, nothing was done. But they ultimately passed out.

The controversy was taken into the Supreme Court. There Chief Justice Marshall, in a notable decision, upheld the legality of the claims.

In that decision it was held that one legislature cannot break a contract duly made by a predecessor, even though it be shown that corrupt influences controlled the first legislature when entering into the contract.

Congress then appropriated the sum of $5,000,000 to pay the claims, which had grown out of the original $500,000 paid to Georgia.

This occurred in 1814, eighteen years after the final sales act was passed by the Georgia legislature. At that time practically all of the original participants in the affair had dropped out of the scene.

It was not until 1864 that the last of the claims arising from the Yazoo Fraud was disposed of by the United States Court of Claims.

The incident had considerable effect on government and the public's attitude thereto in Georgia, and some on government throughout the country.

Since then the government of the state wherein the affair developed has been singularly free of gross corruption, barring, of course, the carpet-bag régime following the Civil War.

It was productive of several rigid requirements, now embodied in most state constitutions, governing the passage of legislation. The most important is the one invalidating anything in an act that is not mentioned in the act's caption. This prevents the enactment of important legislation under the pretense of enacting something entirely different.

The Georgia legislature, incensed by the fact that the fraud had been maneuvered largely by one of its Senators, petitioned Congress to submit to the states an amendment to the Federal Constitution giving the states the power to recall United States Senators at will. Nothing came of this, but it probably was the first attempt made in this country to employ the principle of the recall. The provision, however, was made a part of the constitution of the Confederate States.

But in all this outbreak of indignation, nobody ever was legally punished for any act connected with the affair. Even James Gunn, the Senator who promoted it, died safely and securely in office.

This, however, is not peculiar to that scandal; it appertains to virtually all of like kind which have occurred in this country.

Buncoed by Words— A Plain Man's Reaction

By A. J. TAYLOR

THE word, "deflation," is applied to conceal a disagreeable fact, as are other words such as "democracy," "self-determination," and other post-Versailles words and phrases. We have been unable to locate the word in an earlier period than our own. In Cleveland's time the people were satisfied with "hard times" as a sufficient explanation or sedative. In Roosevelt's time, for some reason, a similar condition did not last long enough to attain the dignity of a term. There is much in a name. It is found preferable to "make" money or profits, rather than to "take" them. P. T. Barnum's statement that the American people like to be humbugged seems to be the only explanation that a searcher after the origin of words can find.

The object of *deflation* is to collect high value dollars on promises made when the value of the dollar was low. To the ordinary person, who does not own promissory notes or bonds, the high or low value of the dollar is of little importance except as he comes in contact with the other class, who own these promises to pay. Ordinarily as the value of the dollar declines, the price that he has to pay for everything rises. After some time and much effort, he secures what is termed *higher pay*. Getting *higher pay* really means that he gets enough, or nearly enough, of the cheaper dollars to balance their depreciation. When the dollar is on the upgrade his wages are at once reduced (in their buying power), without any effort on his part. After some time and much effort the price he has to pay for everything may come down. This state of affairs is termed normalcy, and is deemed to be very desirable, as it leaves the deflators with practically all that we have produced. Our search has thus brought us in contact with two other terms used by our present-day Barnums, *high wages* and *normalcy*.

But the fly in the cream is that the owners of the promissory notes are the same International Financiers who also have all the money. The problem that confronts us is, how shall we pay the International Financier for his promissory notes when he already has all of our money, secured by the ordinary processes of normalcy.

The method of increasing the value of the dollar is also elementary, and always successful. By merely withdrawing the people's money from circulation, an increased demand for the dollar is created, and the value of the dollar rises. This is termed by our Barnums *"restricting credit."*

While the process of deflation is simple, it unfortunately arouses more or less protest. The highest financial authorities have, so far, discovered no process whereby they can extract the contents of my purse without opposition. Of course my dissatisfaction must be moderate. The deflators have defended themselves by terming my natural lamentations *"agitation,"* which is quite true in one sense of the word, or if my protests promise to be in the least effective they have the word *"sedition."*

While it is an open question as to why we owe the International Financiers billions of dollars because they won the war for us, I readily concede that the Germans owe them many billions of dollars because they lost the war. And is it not fitting that our gallant and patriotic International Financiers, who made such supreme sacrifices, should receive these reparations? But it appears that I also am paying reparations to them, and by lowering the mark and raising the dollar, these joint reparations are to be doubled.

Conceding that it is good form to hand the contents of my purse to the financial interest, the fact remains that they were already in possession before deciding on deflation. And they will continue, under the ordinary processes of normalcy, to take everything that I may produce in the future. So why the apparent absurdity of saying that in addition to owing them all that I have, or may have in the future, I owe it twice over?

For some reason I am more concerned in the welfare of our deflators than in my own. I have occasional misgivings as to the fate of the goose that laid the golden eggs, and the sad plight of its unfortunate owner. If the International Financiers demand more dollars than there are, let us make it our first object to see that they get them. It is amazing, nay, even criminal, that one should let his own petty problems interfere with the gigantic task of our deflators who are trying to extract more dollars from the people than exist at present. Certainly my own petty concerns shall not interfere. All I ask in return for my loyal support and personal loss is to be humbugged.

And we may trust our friends to attend to that.

Mending Fences

By CARL SCHURZ LOWDEN

One of the most prominent of the Republican candidates for the Presidential nomination in 1880 was John Sherman, then Secretary of the Treasury and many years later the Secretary of State for a short time in the McKinley Administration. A few months before the Republican national convention he went to his farm at Mansfield, Ohio.

A newspaper man arrived one day while Sherman and his brother-in-law, Colonel Moulton, were replacing the fallen rails of a fence and otherwise repairing it. As Sherman was on the other side of the field, the reporter approached the brother-in-law and asked him what the candidate was doing.

"Why," Colonel Moulton confided in an effort to avoid a direct reply to the political feeler which the query evidently was, "you can see for yourself that he's mending his fences."

Story of Grotius, Father of International Law

By JOHN DAVIS ANDERSON

THE awakening of Europe, for reasons which scholars have not found it difficult to explain, hovers around the period of Columbus' discovery of America. His sailing westward across three thousand miles of ocean marked the beginning of a new era in the history of the world and likewise formed the date of renewed progress in practically every field of the world's endeavor. But other voyages had to be made, and until the globe was circumnavigated Columbus' theory of the earth being a sphere rather than flat remained to be proved.

When once this was established, and the whole coast line of America had been explored, there entered into all Western Europe, and into every department of activity—social, religious, literary and artistic—a new energy and outlook. The old Europe was passing away and the new Europe was shaping itself for the new responsibilities which Columbus and contemporary explorers had thrust upon it. Men were compelled to think along new lines and in new channels.

In considerably less than a century after the discovery of the western continent, we find that England, Holland, France, Spain and Portugal were involved in bitter disputes over questions of boundary lines in the New World, and these were likely to embroil these countries in a state of constant warfare unless some way were found to reconcile contentions over new territory and over the material wealth which this territory seemed certain to supply. Many writers of an earlier period and of that period had dealt with the subject of international law and there were fair foundations for a more comprehensive work on the subject.

Three centuries ago the world was without a complete work treating of all subjects bearing upon international law. It was Hugo Grotius, who, in June, 1624, completed his *"De Jure Belli Ac Pacis,"* a work which stands today as the greatest reference book on this subject. It has made the name of its author a household word throughout the civilized world and has entitled him to be known as "the Father of International Law."

A Precocious Boy

GROTIUS was no doubt induced to undertake this work by what had occurred during the Thirty Years' War. Sir Thomas Barclay has said on this subject: "In the north of Europe, again, out of the active commercial intercourse among the Baltic and North Sea communities, grew rules of the sea in the same common interest. It was the Thirty Years' War, with its revolting cruelty, which brought out the contrast between the more humane practice of war as an art in Italy and the mere bludgeonry which prevailed in the brutal struggle which disgraced the first half of the seventeenth century. The brutality of the struggle drew attention to the need of formulating rules for the protection in time of war of non-combatants and the innocent subjects of absolute sovereigns.

The life of Grotius was a fascinating one, filled as it was from childhood with an admixture of achievement and adventure. He was born at Delft, Holland, on Easter Day, 1583, and had he remained in Holland he would have been known to the world as Huig van Groot. He came of a family of distinction, the ancestor of which was a Frenchman who had moved to Holland a century before the great Grotius was born. The French name of this family was De Cornet. The father of Grotius was a lawyer of distinction; he served four terms as burgomaster of Leyden, and was one of the curators of the university in that city. There is no record of any boy being more precocious than Hugo Grotius, for at nine he was able to write Latin verses and at twelve he was ready to enter the university. At fifteen he edited an encyclopedia. A little later, through Count Justin, of Nassau, he met J. van Olden Barneveldt, with whose life his career became strongly linked until Barneveldt was put to death.

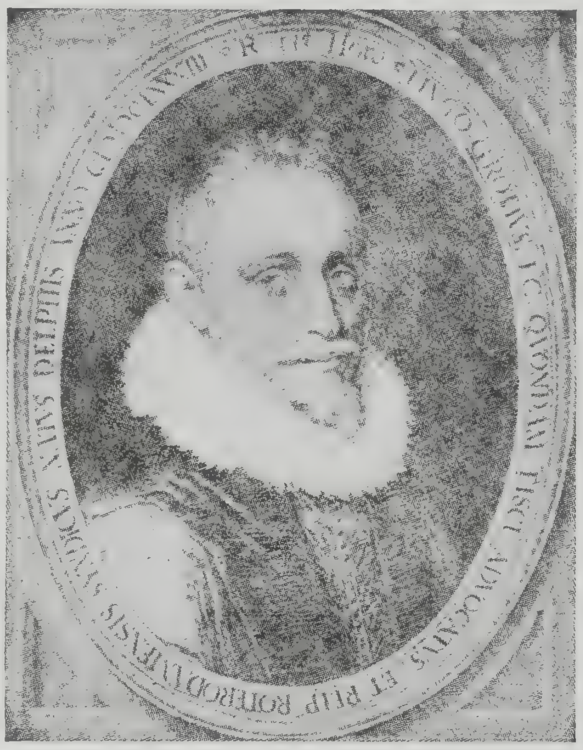
When he had reached sufficient age, Grotius entered the practice of law. In this he achieved success, but his strongest inclination was toward literature. His first original work took dramatic form and was written in Latin. He wrote *"Christus Patiens"*; *"Sophomphaneas,"* which was the story of Joseph and his brethren, and *"Adamus Exul,"* a book said to have given many suggestions to John Milton. We find all of these works translated into the English language.

In 1603 it was thought advisable that the United Provinces should preserve an account of the Dutch struggles against Spain and the plan was finally devised to have Grotius act as historiographer. At this time he was only about twenty years of age. Soon afterward he became advocate-general of the fisc for the provinces of both Zeeland and Holland. His marriage to Marie Reigersberg occurred in 1608. This lady proved no ordinary wife, as we shall presently see.

The next decade was destined to be a period of great activity and varied experiences in the life of Grotius. Even before his marriage he was engaged in the writing of a treatise—*"De Jure Paedae"*—which he never published and the fact that the manuscript had been prepared was unknown until 1868 when it was brought to light. It appears that Grotius, on completing the manuscript, was dissatisfied with its literary style and put it aside. It contains the groundwork of his world-famous book, which, as already noted, was not written until two decades later. The earlier work clearly shows that from his youth Grotius had conceived the idea of a work of international scope, written along such broad lines that it would endure and never be supplanted as the basic effort upon the subjects of which it treated.

Grotius, after his marriage, turned his attention to the subject of the East Indian trade. Spain and Holland were at war over the matter, and both nations at nearly the same time had become interested in the subject of peace negotiations. The Dutch refused to relinquish the right they claimed to this commerce, while Spain would not sanction its continuance. The position of the French and English ambassadors was that trade in the Indies was permitted by the law of nature and was not a matter for treaty. The whole summer of that year brought Spain and Holland no nearer together. In the meantime Grotius had written his *"Mare Liberum,"* and his *"History of Old Holland"* soon followed.

> On April 13, 1613, Casaubon, perhaps the greatest Continental scholar of his time, wrote of Grotius to Daniel Heinsius: "I am very well and cannot express my great pleasure in the conversation of so great a man as Grotius. Oh, that wonderful man! I knew him before, but fully to comprehend his excellency and his divine genius, one must see and hear him. His countenance speaks honesty and his speech reveals the profoundest learning. It is not only upon me that he made this impression; all the pious and learned to whom he has been here introduced have felt the same way toward him; the king especially so."



HUGO GROTIUS

A dispute then arose between England and Holland over the rights of walrus hunting in Greenland, and Grotius was sent by his country to England to discuss the question and to accomplish whatever he might. England at that time was stronger on the sea than were the low countries, and consequently no restitution was made and the subject remained open.

Imprisoned by Prince Maurice

WHEN Grotius was but thirty years of age he was made pensionary of the city of Rotterdam, and this brought him closely in contact with Prince Maurice.

About the time that he returned from England the theological parties in Holland were at the breaking point and it was apparent that unless conciliatory measures were used force would have to be applied to prevent internal disturbances. The matter which caused the great division was the orthodox Calvinists dividing themselves into one group and the Remonstrants, holding other views, into another. Grotius did his best to find some common ground upon which these two groups might be brought to agreement. He probably did not realize the depth to which a nation can be stirred over theological questions nor the hatred which in those days of religious intolerance would come to sway the minds of men, and especially kings and princes. Prince Maurice, in his earlier activities, had advanced the interests of Grotius to such an extent as to engender the deepest jealousy against him. These enemies were not slow, when Grotius could not heal the breech between the two factions, and had joined the Remonstrants and sided with Barneveldt, in carrying tales to Prince Maurice. This brought about an estrangement between them which was never healed. In the meantime this religious controversy was separating families, rendering orderly government practically impossible, and giving every indication that a religious war was at hand.

Grotius continued his efforts toward peace, and with a delegation went to Utrecht, but with results disastrous to himself. During the secret council there Prince Maurice, now stadtholder, appeared, and was to Grotius an unwelcome guest. After taking part in these deliberations, the prince a few days later took military possession of the town and from that moment Grotius' life was in danger.

On August 29, 1618, he was arrested, placed under heavy guard and every effort was made to prevent his escape. Both Barneveldt and Counsellor Hoogerbeets had been arrested in the same way. This was all part of a prearranged plan of Prince Maurice to destroy entirely the influence of those who had opposed him. The Prince's greatest anger was displayed in his treatment of Barneveldt, then an old man, who soon after his arrest was beheaded without trial. A short time later word was conveyed to Grotius of his fate. He was to be imprisoned for life and all of his property confiscated! The place of imprisonment was to be in the fortress of Louvestein, near Gorcum, to which place he was conveyed on June 5, 1619.

Grotius was then only thirty-six years of age, and there was nothing before him but lifelong captivity. The journey to his prison was made at night. To make his sentence as humiliating and as heart-rending as possible, permission was refused his wife to accompany him. Even his brother was denied the same privilege, and Grotius made the journey without a friend in the party other than Hoogerbeets, his associate, whose sentence was the same as his own.

The fortress of Louvestein is situated at a point where the Meuse and Waal meet, and is said to have been constructed by the Normans in the year A. D. 836. Grotius was kept here for some time alone, but finally the states-general granted permission to Madame Grotius to take up her residence in Louvestein and finally to join her husband in the prison.

His Remarkable Escape

THE town of Gorcum is situated nearly two miles down the Waal and at the time when Grotius was imprisoned there one of its leading citizens was Adrian Daatselaer, a ribbon and thread merchant, and between his wife and the wife of Grotius grew an intimate friendship. By arrangement, books from Daatselaer's library were brought to the prison, being conveyed in a large chest. At first the commander of the prison opened this each time that it was brought into Grotius' quarters.

Madame Grotius finally observed that vigilance in this regard had been permitted to relax. To the mind of this keen-witted woman there came, almost as a vision, a possible way for effecting her husband's escape. Grotius was to be locked in the chest in place of the books and carried to freedom, if the plan worked, by the very men whose duty it was to detain him. Madame Grotius' scheme was contrived with the utmost care.

It was found by actually placing Grotius in the chest that the plan was feasible. To test whether he could breathe while so inclosed, he actually remained in the chest while an hourglass ran out twice. If the journey could be made to Gorcum in less than this time the plan might work! The next step was to prepare a few good friends at Gorcum for the reception of such an unexpected guest. Madame Grotius began with Madame Daatselaer and found in her a safe ally. Elsje van Houeening, a girl of twenty, had become the maidservant of Grotius' family and was quartered with them in the prison, but permitted to go and come as she chose. Her mistress gave her the details of the scheme, brought to her attention the hazards that surrounded it, and found in her a trustworthy, willing, and courageous assistant. Madame Grotius' next step was to obtain permission to remove the chest from the prison and in place of consulting Lieutenant Deventer, gained the consent of his wife.

At dawn on Monday, March 22, 1621, Grotius prayed for an hour that God might bless his attempt to escape. A couple of hours later he entered the chest clothed only in scanty apparel, and wedged in so tightly that he could scarcely stir. His wife adjusted the lid and, turning the key, gave instructions that the chest should be removed and sent on its way accompanied by Elsje van Houeening.

There were many anxious moments before the box reached the home of the Daatselaers, and after remaining there a short time Grotius made his way to Antwerp and was concealed in the house of a friend until he could finally journey safely to Paris. This he undertook on April 3. The following October he was joined by his wife and not long afterward Louis XIII conferred a pension upon him.

About two years later he began the preparation of his great work on international law which, as we have seen, he finished the next year, and which was published in the month of March, 1625. It has always been a source of astonishment to his biographers that a work requiring such immense reading should have been completed, in the style in which it was, in so short a space of time. Grotius is said never to have received any profit from his book, but it brought such wide reputation—a reputation such as no other legal treatise has ever enjoyed—that he was compensated for his masterly effort far beyond material reward.

One of the great hopes of Grotius' life had been that the success of his writing would mean his being recalled to Holland and being re-established in the service of his native country, but the same influences which had caused his downfall and his imprisonment rendered his efforts in this direction futile, and he was compelled, by reason of his modest circumstances, to seek an outlet for his skill and learning.

This finally came from Sweden in the form of an invitation to become the ambassador of that country to France. This position he filled for some time with distinction, despite the efforts of Richelieu who especially disliked him. In 1645, at his own request, Grotius was recalled and was received with honors at Stockholm. He was not happy there and soon sought and obtained permission to leave for France. A storm drove the ship, in which he was sailing, upon the coast near Dantzig. He was then ill, and died on August 29 of the same year.

British Labor's Rough Passage in Political Sea

Ramsay MacDonald's Skill as Pilot Severely Taxed to Avoid Disaster

By W. P. CROZIER

RAMSAY MACDONALD'S Labor government, with the backers of Free Trade behind it, may come through safely, but no one believes that its life will be prolonged. There are some who think that both the Conservative and the Liberal parties deliberately put Labor in office that it might suffer shipwreck, after having first presented to the country and to its own supporters a spectacle of weakness and indecision which would result in its overthrow by a resentful electorate when the next appeal to the country is made. Politics is largely tactics. The tacticians had certainly some such hopes in mind and at the moment they have ground for satisfaction.

It was inevitable that when the Labor party accepted office, although in a minority in the House of Commons, it should gravely disappoint the expectations it had raised. On the platform the Labor party had presented itself as something different from and better than both of the older parties. To Labor a Liberal was no better than a Tory; indeed he was considerably worse because he represented himself to be as good an idealist as a Labor man. Labor intended to change the face of society, to institute the public ownership of the public services to begin with (like the mines and railways) and all other industries afterward, to enforce a levy on all capital and to abolish unemployment. Labor proclaimed that it alone had an immediate and decisive remedy for the ills from which the masses of the people suffer.

Steering a Middle Course

LABOR in office speedily proved to be different from Labor on the platform. In composition the ministry was found to bear an uncommon resemblance in many respects to our conventional middle-class governments. It includes peers like Lord Chelmsford, who had always been supposed to be a Tory; Lord Arnold, who used to be a wealthy stockbroker in Manchester, and Lord Haldane, who is a convinced Imperialist and was suspect even of the bulk of the Liberal party because he was one of the leaders of the Liberal Imperialist revolt against that good Liberal Campbell-Bannerman at the time of the Boer War. Then it appeared that in spite of the protests of Tom Johnston and the Glasgow Socialists, all these Labor ministers intended to take their full salaries as ministers of the Crown. There is no reason, from the Liberal and Tory point of view, why they should not but it is felt to be difficult, all the same, for Labor ministers to pose on every platform as the peculiar champions of the poor and downtrodden against the older parties and then to draw their £5,000 a year. Similarly, although it is right and proper that Labor ministers should attend the king's levees at court in full dress, thereby demonstrating that they are a national and constitutional party, it is conceivable that many of their supporters in the slums are asking whether it was equally necessary that they should dress their sons up in a court "rig-out" and send them, too, to the levees. The upshot is that in the next electoral campaign Labor will find it difficult to maintain the old pose of superiority over Liberals and Tories whereby they suggested that they were the spiritual inheritors of apostolic poverty and holiness while all their opponents were capitalistic oppressors arrayed in purple and fine linen.

Labor—regarded as an unruly elephant between the two tame animals—began quite well. It recognized what it could and could not do. Socialistic schemes and the levy on capital disappeared from its immediate program. Tactically, this was a score for Labor's opponents. Labor's battle cry had been that by these measures it would abolish poverty and that it would have no truck with its opponents, and here it was to be seen accepting the support and co-operation of the Liberals and jettisoning the very policy by which alone it had declared the country could be saved. It was exposed to the gibes of the ex-Premier Baldwin, who challenged it in the House: "You would not have my remedy for unemployment, which was Protection. You said you had a remedy of your own—produce it now!"

Labor, of course, between the two tame elephants, can produce no bold and characteristic measure of its own. It can, however, carry out a number of useful improvements in social policy—things which will make brighter the lot of the working classes, and that it has been doing. But at any drastic step it is liable to be pulled up sharp, with a consequent loss of prestige and popularity. Its inexperience is a great weakness to it, especially when it is pushed by its Left wing, the Glasgow Socialists, into extreme proposals of which it cannot foresee the consequences. The older parties have always at their disposal wary and astute advisers. They take their time in framing their proposals, that, when made public, they may be water-tight. Labor sometimes rushes in impetuously, not seeing whither it is being led, and the result is catastrophe. Of this the question of the eviction of the unemployed from their homes has just furnished a striking illustration.

Mr. Wheatley, who is regarded as the leader of the Glasgow men, introduced a bill whose first clause laid it down that a man who could not pay his rent because he was unemployed should not be liable to eviction by his landlord from his house. This meant that the landlords were to be singled out from all other classes; they were to go without their rent; they were to support the unemployed in a way no other class was asked to do. Of course the clause could not stand. There was an immediate outcry and behold! in the very speech in which Mr. Wheatley introduced this measure he announced that it was not intended that the landlords should foot the bill. But who, then, was to pay the rent? Mr. Wheatley did not know and could not say. The government did not know because the government had not considered the question. It is now admitted that the bill had been drawn up in haste and without any thought of its implications. This question of evictions for nonpayment of rent is largely a Glasgow matter and, so far as can be discovered, Mr. Wheatley and his Glasgow friends had hurriedly drawn up a clause prohibiting evictions and thought no more about the matter. Probably the unfortunate prime minister, who is worked to death with foreign policy, had never seen the clause at all.

But the government now had to decide upon a policy. J. R. Clynes, a trade union leader without much grip or drive, announced that the landlord's rent would be provided out of the poor rates. (In some districts in England the Poor Law Guardians already make an allowance to the destitute for the payment of rent.) The Glasgow Socialists were furious, for this meant that heavy expense would fall on the actual district where the unemployment was. They revolted and Mr. Clynes, finding his position precarious, surrendered and declared that the money would be found out of state taxes; the state treasury would reimburse the Poor Law Guardians. But there was yet a fourth change of front, for when the government, after some days, came to explain its intentions to the House of Commons, it failed to make clear who would find the money for the landlord or even that the unemployed tenant would be adequately protected; it only said that before a man was evicted he must have had an adequate opportunity of appealing to the Poor Law for assistance. On this a majority of the House of Commons threw out the bill. The whole episode is a remarkable evidence of the inexperience and thoughtlessness of a party new to office. The meaning of the original clause has never been thrashed out. The government and its advisers had never realized how serious a thing it was either to deprive the landlord class of the rents to which it was justly entitled, or to lay it down that the landlord class should be guaranteed its rents from the local rates or national taxation. These are very important questions of principle and they cannot be dealt with casually by any government. The Labor party, in a word, has to learn its lesson. On a long view, it will probably have cause to be grateful for its harassing period of office. This spell of authority is likely to be short, but when it comes again to power it will be much better equipped to grapple with the older parties.

The Armament Difficulty

THE problem which, apart from the rents question, has given the Labor government most trouble, is that of armaments. The majority of the Labor party members are strong pacifists. Some of them are conscientious objectors, and they have almost all assailed the Liberal and Conservative governments of the past for keeping up the armaments of the country. Now they themselves are responsible for the country's defenses and they find themselves embarrassed. The Under-Secretary for the Air has combined his defense of the expenditure on air defenses with the bluntest pacifist doctrine. There is no harm in that, but the defense of the government's decision to build five new cruisers has been remarkable. It was defended on the ground that the building of the cruisers would relieve unemployment in the dockyards. A member for a constituency famous for its chemical works at once suggested that poison gas ought to be manufactured to relieve the unemployment in his district. The Labor government, which has bitterly denounced armaments as unproductive expenditure calculated to cause bad blood and national competition and ultimately war, can justify its action in building more warships on almost any ground except the relief of unemployment, but certainly not on that.

In spite, however, of some weaknesses and inconsistencies, practically no one desires the fall of the Labor government and the confusion of a fresh election, which might simply repeat the verdict of the last one. For one thing, there is a strong desire that Mr. MacDonald should have time to try his hand at solving the terrible European problem, whether we call it by the name of reparations or French security or something else. Lloyd George, Bonar Law and Baldwin have all tried their hand at it and all have failed. Most Liberals, certainly, will heartily support MacDonald in his attempt both to maintain friendship with France and to settle the quarrel which, if it is not settled, will involve Europe in a new war. The triumph of the Left Bloc parties in the French elections, and the consequent resignation of Premier Poincare may further the British Premier's aspirations in this direction.

Another Serious Danger

MOST Liberals also, and many Conservatives, believe that there is much useful work at home in the bettering of Labor conditions that this government can do if it will be content to remember that it is a minority government and to march prudently. The danger is that the Socialists of the Left will drive the government into such extreme measures (like that relating to the unemployed tenants) that the other two parties will put them out of office.

The government has another serious danger to face and that is the growing epidemic of strikes. There is no doubt that in various industries the workers thought that under a Labor government their opportunity had come. Strikes have been called and the strikers have done well; the employers have given way substantially. That led to other strikes and in many instances the strikers have it in their power to "hold up" the public—railways, trams and so forth—and by that means obtain what they demand. Consequently they are better paid than the more skilled men who, like the engineers, can be paid only according to the earnings of their industry, and as a consequence the engineers and other skilled artisans are furiously discontented. Thus the Labor government is threatened on every hand—by the ardent Socialists who are at loggerheads with the moderate Trade Unionists, by the Conservatives, by part of the Liberals, and by the industrial unrest. Their best friends think that this experimental period of office is a most useful training period and they hope that it will last long. They hope so but they do not think so.

Tag, Your It, Mr. Taxpayer

"IF YOUR town goes broke, as so many of them in Ohio are going just now, use the ever-popular method of a drive for funds." This is the advice of Franklin, Ohio, a village just north of Middletown in the southwestern part of the state, and known as the home of the Miami Valley Chautauqua.

Franklin, like other cities and large villages, suffered from the bond malady; it required most of her income for the redemption of maturing bonds and interest.

Early in April there was about $50 in the treasury to meet expenses for the next six months and to pay outstanding bills for $1,400, and by no possible means of computation could the city officials see a way to make $50 into a hundred times that much.

Many had foreseen this crisis in the finances of the town and had been discussing means of meeting it, but no method to raise the money legally could be devised, so some one hit upon the idea of a mass meeting of citizens to talk over the matter.

Arthur Bryant, city solicitor, explained the situation in detail, blaming the state tax laws, damage done by the flood of 1913, and the constitution adopted in 1912. He also stressed the fact that bonds had been issued in previous years without provision being made to pay them when due, compelling Franklin to pay for horses used for many years or long since dead.

A suggestion was made that a campaign for funds, $5,000 being required, be carried on, similar to a drive for Red Cross or Community Chest. The suggestion was heartily approved, and S. S. Tibbals was made chairman of the committee to conduct the drive.

It was completed early in May and $6,000, payable in monthly installments, was obtained.

So today Franklin has its police department, its fire department, and its electric lighting.

And the people who were taxed once to pay for these submitted to another voluntary tax rather than do without them.

What the Northwest Farmer Thinks of His Job

Concluded from page 9

taking some heavy losses from the bankrupt wheat farmers."

Turning now to South Dakota, we have a very wise and very bright exposition of the virtues of diversified farming from a farmer's wife in McCook County—and let me tell you that farm women in the Northwest know just as much about farming as their husbands do. Many of them practice it, too. Here is what this correspondent wrote:

"To be a prosperous farmer, one must practice diversified farming; grow a year-round supply of food for the family; then grow plenty of feed for livestock, and have good livestock to eat it; and if possible have something to sell every week of the year. This is just good business, or in other words, just 'good common sense.'

"If we do this, we can pay off our debts, and pay cash for the things we buy, and have money in the bank. If we do this, hard times cannot cripple us, or lead us into bankruptcy. The farmer who buys all his living, and the farmer who has something to sell only once or twice a year, will be hard up, 'hurt' or 'sore' about nine-tenths of the time, and will never be a successful farmer.

"Our successful farmers—the ones who stay in business—are the ones who first look after the home-grown food supply. These are the farmers who will have a bank account. The farmer who doesn't look after it will have a store account.

"It makes no difference where we farm, we are not safe unless we grow enough crops and manage the farm so our work is distributed throughout the entire year. If we have something to sell every week, we will be boosters for ourselves. We can keep out of discouraging debt; we can look anybody in the eye; we'll think more of ourselves; we'll be regular folks with a factory running every day in the week."

This, too, from Grant County, South Dakota, supports the diversified-farming plan—and tells of some very common failings of farmers all over the Northwest:

"Our community, at large, is very inefficient in proper handling of hogs. We have only a few hog houses, and only one or two of these are modern in any respect. We must have better equipment for hogs, as they are the main source of the up-to-date farmer's income here.

"We need more producing dairy cows and the elimination of the 'boarder' type cow that does not pay a profit. We need a cow-testing association in order to weed out our non-producers, and keep and buy only those that will produce a profit for us.

"As a community we need more co-operation. We need more community organizations to get the farmers together, not only socially, but to discuss the various phases of farming, the marketing of our products and care of our livestock. We need more co-operation with our county agent, county club leader, and the extension department of our state agricultural college. The sooner farmers will make use of these departments of agriculture, the sooner they will be headed toward more efficient farming methods.

"We need standardization of farm produce. We must grade our products and, if we have No. 1 grade, demand a No. 1 price for it, in place of a flat rate paid for all grades. To do this we must become more efficient in handling our produce, and there must be enough of us producing high-quality produce to demand No. 1 prices.

"There are a few farmers, who have not started diversified farming to any great extent, who still believe wheat is their only salvation. The past several years have proved to me that wheat farming is a thing of the past in this section. The corn crop is the one crop that is most dependable now.

"We must rotate our crops and put in more clover and alfalfa. In our community sweet clover leads as a land-builder and also as a cash seed crop. There are but few farmers who plan a rotation program, which should be done to rebuild our soil for greater production.

"More farmers need to quit burning their straw piles, and allow them to rot and haul them back on the land again. These farmers are taking everything off the land and putting nothing back. In this way they run the land down, and wonder why it won't produce."

Credit for Stock-Buying

REAL suggestions on credit, good farming and taxes are contained in the following letter from a farmer's wife in Potter County, out by the Missouri River, South Dakota:

"I do not believe there would be nearly so many farmers going bankrupt and broke if credit would be given so they might buy livestock and other things that would grow into money, instead of things that keep decreasing in value. Farming is just like any other business; if one is going to make a success of it, he has to stay on the job, and use his eyes and brains, and work hard.

"It is the farmers who are not loafing on their jobs, the farmers who do general farming, have eggs and cream checks to pay for their living expenses—leaving the proceeds of cattle, grain and hogs for improvements, for paying taxes, and buying labor-saving equipment for themselves and their families—who are holding their own and enjoying life these hard times.

"It is the opposite kind of farmers who are worrying their heads off about interest and debts, or complaining about not having any 'luck' and the banks not loaning them any money.

"This county could do with less taxes, if they would encourage honest, conscientious men and women to run for office, and insist on having that kind, instead of so many irresponsible, lazy ones who are looking for a snap. We should also discourage those who have other business and run their offices by hiring deputies to do their work. I do not believe it is improvements in the county that are bringing taxes up so high, so much as the waste and graft that go along with them."

Our last port of call is Montana, from which state one letter will be quoted. It came from Richland County, in the extreme eastern part of the state, and one of the best sections in Montana. After beginning his letter with the statement, "We own a 680-acre farm, and by this I mean it belongs to us," this writer goes on to say:

"I think the greatest room for improvement among farmers around here is in more co-operation in the buying of better livestock sires and also in some labor-saving machinery. I own a corn binder, header, silage cutter, and threshing machine in partnership with different ones of my neighbors.

"While I am a believer in diversified farming, I don't believe in any one farm trying to raise everything there is. Better confine ourselves to a few things, and do a better job of that.

"I think Henry Ford is right about our marketing. We are still in the primer when it comes to marketing our crops.

"While our farm the last few years is not paying us for our work and interest on our investment, we have had no trouble in keeping out of debt, and last year we bought a new 'buzz-wagon,' and this winter we bought a brand new radio set which makes lots of entertainment for us these long winter evenings.

"We have overcome the greater portion of the difficulties and problems which we had to solve at the time of making settlement in this country, although it will cost us our homes and fourteen years of hard labor if we have to move away, which most of the farmers are doing at this time. The other fellow will get the benefit of our experience.

"If we ever hope to improve our farming methods and living conditions out here, we must have a high tariff on our wheat, so as to shut out competition. We must adopt a marketing system that is more direct and simplified, so as to cut down handling charges. We must have an export corporation to handle the surplus and advance the price of wheat, so that its buying power will be on an equal basis with the commodities which we have to buy. The Federal Land Bank should take over at a cheaper rate of interest the securities now held by the loan companies against the wheat growers. We need loans with the privilege of paying all or any part at any time.

"We can't all raise stock on a large scale."

Are You a "Mooch"?—Here Is Your Number

Concluded from page 2

through high-pressure stock-selling campaigns always spend their new capital recklessly and soon find themselves in straits, even if they had good intentions. They have to pay a ruinous price for such capital in the way of dividends and underwriter's discounts. While Ohio laws limit the promoter's commissions to fifteen per cent, this can usually be evaded without detection.

Even when the management of a company markets its own securities through its own high-pressure staff and starts out with good intentions and high ambitions, extravagance always seems to bring their house down in ruins.

Josiah Kirby and his Cleveland Discount Company is a case in point. This man came to Cleveland in 1912 with $5.25 and ten years later had the second largest mortgage company in the world. He was a wonderful salesman whose ability did not seem to extend into the loaning field.

Kirby did not employ the extreme type that has been dwelt upon. He picked men of good standing such as hustling clergymen, bank tellers, and so on, paid them well and treated them royally. He is said to have given his selling staff fifty motor cars in one season. A special train party to California was another expense item.

Kirby once gave his men an exhibition of super-salesmanship. He asked those at a salesmen's convention to repeat the worst things they had heard about the company or its head. One man reluctantly repeated the caustic remarks of a Cleveland business man. Kirby adjourned the meeting for a couple of hours, went out and called upon the man and returned to the next session with a check for ten thousand dollars for stock in the company. He put over six million dollars in a fine twenty-story building. At that, Kirby is far from being the worst type of promoter.

Punishment of fake stock promoters after the public has been fleeced and the money dissipated always impresses one as a sort of bootless performance, although well merited. The president and secretary of the Dollings company have been sentenced to twenty years' imprisonment for using the mails to defraud. The directors of the American Finance Company are being sued for nine hundred thousand dollars, since many of them are men of means. The Hawkins Mortgage Company is being considered by Federal authorities.

However, the proper protection of the public requires that exploitation be stopped at the source before the public's money is obtained. Beck has shown that without these squads of high-pressure salesmen the present traffic cannot flourish.

The faulty attitude of almost everyone toward profiting through interest instead of productive effort is at the bottom of the whole system that impels everyone to take risks in stock and bond selling. Take the chattel mortgage and so-called finance companies which offer stock paying high dividends. Beck is of the opinion that it is almost impossible for one of these companies to fail if honestly and fairly well managed, since they take such a heavy toll from their customers. On the other hand, the excessive interest charged borrowers makes these companies a social nuisance. They impose an unfair burden upon people who are tempted to borrow instead of working and saving.

When the world learns that interest is something that destroys, these temptations will cease to exist.

Gobel Was Creator of Hot-Dog Habit

ADOLPH GOBEL, who died in Brooklyn the other day, would doubtless have been immortalized by Brillat Savarin if the famous Frenchman who wrote so wittily of the table had known him. For Gobel was the leading personage in creating the great American "hot-dog" habit.

The hot-dog business, be it said, is no slight item in the public service of food. It takes rank on its own account. Gobel's concern alone was said to be turning out more than one hundred and fifty tons of frankfurters every week, as well as other products and additional capacity was being provided.

The importance of Gobel's plant was that from the beginning its frankfurters set the pace for high quality and popularity. All the art and science available in the packing business were concentrated upon this small specialty by the astute Gobel. The patron of the sidewalk stand was given the same perfection as the diner in the Ritz. It paid well because the custom of the general public is always more profitable than of the so-called luxury class.

It is said that more than thirty thousand hot dogs are served at the Polo Grounds on a Sunday or holiday. During a six-day bicycle race in Madison Square Garden more than sixty thousand hot dogs were sold to the audience. A concessionaire at Coney Island serves more than two tons of hot dogs every Sunday. Suburban dealers who specialize in the automobile trade often sell upward of fifteen hundred daily during the week-end and on holidays with satisfactory week-day demand.

This extraordinary demand for hot dogs has become national. They are the mainstay of more and more quick service lunch rooms and concessionaires at outing and amusement places. Mr. Gobel started something by giving the public a quality product in highly appetizing form.

At ten cents each there is a handsome profit in hot-dog stands doing a volume business. It is said that thanks to the standard set by Gobel only those serving the best can retain a good, steady trade. The generous serving of mustard, almost costless per portion, is an important element in pleasing the patron and causing him to ask for more hot dogs.

This German immigrant, Gobel, who came to America forty-four years ago at the age of sixteen, well deserved the fortune and good name that came to him in the packing industry and provision trade. He put the manufacture of what was regarded as a negligible item on such a high basis that the American public became his patron. While others imitated him, the name of the master was respected by everyone. His success is evidence that it pays manufacturers and business men to treat the public right, no matter how small or unimportant the thing may seem to be.

Jews Oppose Bible in Public Schools

THE supreme court of the sovereign state of California, having decided that the Bible is a fit book to be placed in the libraries of the public schools, the Jews of that state, led by Rabbi Rudolph I. Coffee, of Temple Sinai, Oakland, have started widespread opposition to the keeping of the Book of books where American children in American public schools may have the opportunity of reading it. The supreme court decision came up from the superior court of Fresno County, on appeal, in a suit in which the trustees of a school district were served with a restraining order forbidding the placing of twelve copies of the Bible in a high school library.

The supreme court, in its decision, declares the King James Version of the Bible to be non-sectarian, and adds:

"We do not assume to decide the comparative merits of the King James or the Douay versions of the Bible, but both are eligible to a place on the shelves of our public school libraries for reference purposes, as well as copies of the Talmud, Koran, and the teachings of Confucius."

This means that public libraries, as well as school libraries, now may keep the Bible as a reference work, along with the Jewish Talmud, the Mohammedan Koran and the Books of Confucius. This seems to be satisfactory to the Mohammedans and to the Chinese, but the Jews refuse to allow even the supreme court to permit American school children to read the Christian version of the Bible. Rabbi Coffee issued his protest against the decision of the supreme court from the pulpit of his synagogue.

In the face of Rabbi Coffee's rush to ostracize the Bible from the public schools, it will be noted that the supreme court decision is not concerned with the *teaching* of the Bible, but solely with its use as a reference book; that the Talmud (the Jewish Holy Book) is given as full rights in the school library as the Bible, and that the King James Version is indicated simply because it is the one most widely in use, most commonly read and most easily obtainable. These points in the decision take away all basis for the rabbi's protest, and leave him merely demanding that the Christian Bible be excluded entirely from the schools.

This Jewish effort to prevent Christian children from coming into contact with their own Bible in the schools of a Christian nation, brought an answer from several ministers.

Photographing Sound Waves

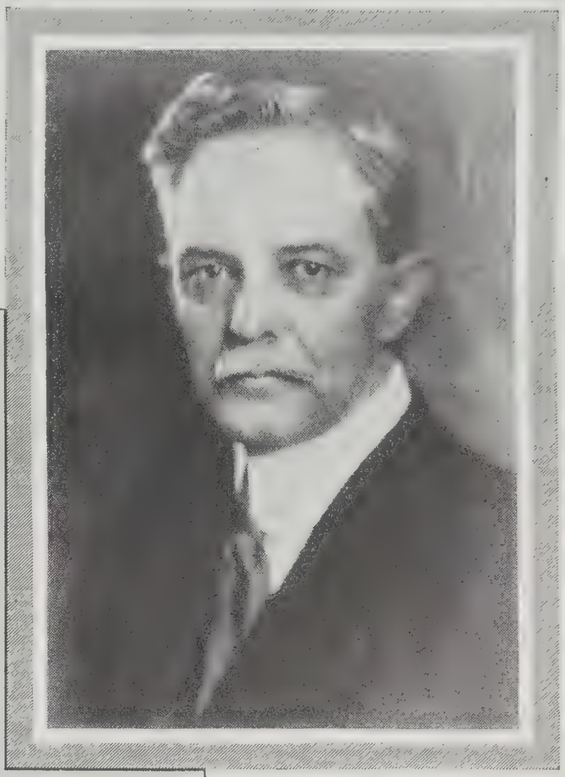
ARTHUR SCHOPENHAUER (1788-1860) in his great work, "*Die Welt als Wille und Vorstellung*" (1819), discussed the manner in which the *will* expresses itself. For Schopenhauer the most sublime expression of the *will* is found in art. Of all the arts, music is the most expressive of the nature of the *will*. In music the *will* truly manifests itself as the mysterious cosmic traveler who wanders forth, strives, struggles passionately, changes, and returns only once more to begin its eternal onward motion. The symphony of life is composed about the *will* as the *keynote* or *tonic* and to that it returns in the great climax, death, the sublime awakening. Schopenhauer regards the *will* as the very essence of the *soul* and music is its most perfect expression. In music we hear the eternal striving and restlessness of the soul and in its onward surge Schopenhauer finds the answer to the question—*What art Thou?*

Science deals with that which is determinate and describable in terms of those specific uniformities which we call natural laws. The capricious, restless movement of the *spirit of music* is expressive of *creative freedom*. Can science subject this unfettered activity to mathematical scrutiny and make it an object of precise physical observation? In a measure this can be accomplished insofar as the physical results of this free expression permit. The vehicle of this creative and free expression is matter, deterministically responsive to all the moods of the untrammeled spirit of music. The material phase of music is subject to physical law and mathematical interpretation. Through the law-ordained vibrations of material particles capricious music appears in precise mathematical garments. The writer recalls with exceptional pleasure the reading of H. L. F. Von Helmholtz' wonderful work "Sensations of Tone," first published in 1863. Helmholtz reflects the thoughts of Schopenhauer in his statement: "Music alone finds an infinitely rich but totally shapeless plastic material in the tones of the human voice and artificial musical instruments, which must be shaped on purely artistic principles, unfettered by any reference to utility as in architecture, or in the imitation of nature as in painting, or the existing symbolical meaning of sounds as in poetry."

In his remarkable presidential address entitled "Mathematicians and Music," Dr. R. C. Archibald, professor of mathematics at Brown University, discussed the contributions of ancient and modern mathematicians to the science of music. This highly important contribution was published in the January number (1924) of the *American Mathematical Monthly*. In this article Professor Archibald analyzes the nature of the mathematical theories of music advanced by such great men of antiquity as Pythagoras, Euclid, Aristotle, and Aristoxenus. Archibald states that Aristoxenus was the most noted of all the musical theorists of antiquity. He is accredited with the writing of four hundred fifty-three works on the theory of music.

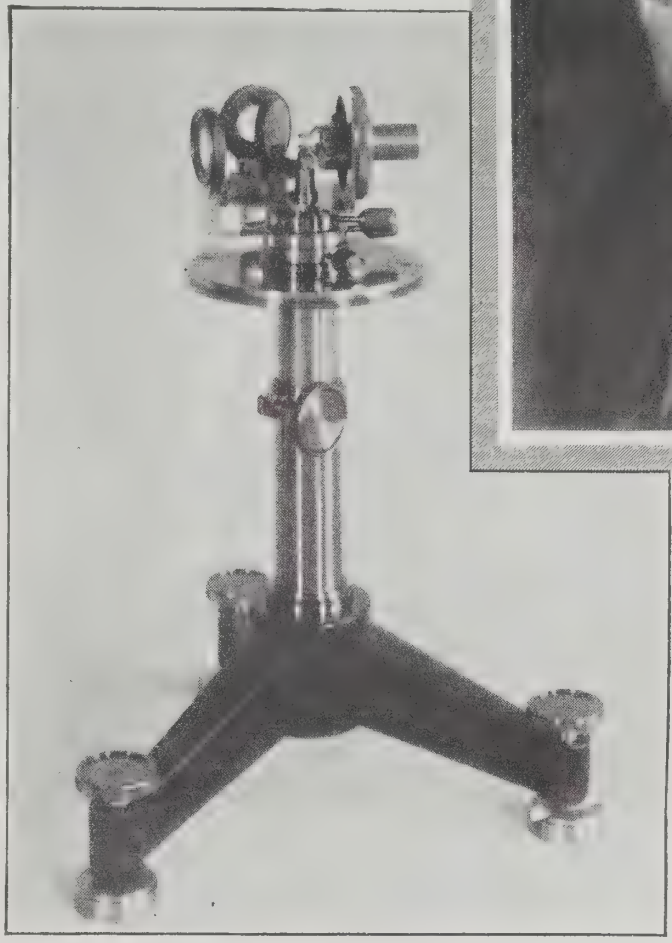
American science has made particularly noteworthy contributions to the study of musical sounds and the tone qualities of musical instruments. In a very large measure the credit for this highly important work is due to Dr. Dayton C. Miller, professor of physics, Case School of Applied Science, Cleveland, Ohio. Although Dr. Miller is recognized as one of the world's most eminent authorities on this subject his other scientific achievements are of such exceptional importance that his position in modern science is uniquely established independently of this particular contribution. Professor Miller's careful interferometer investigations are of extraordinary significance at this time because of their bearing upon Einstein's theory of relativity. Personally, Dr. Miller eminently represents those characteristics of modesty, sincerity, and perserverance in the fearless search for truth which we associate with the highest type of the scientific idealist. He is the author of "The Science of Musical Sounds," and many other notable works on this subject.

The Phonodeik, invented by Professor Miller, is an instrument which photographically records sound waves. It is responsive to ten thousand complete vibrations a second. A motion of one-thousandth of an inch is magnified twenty-five hundred times on the photographic record by means of a minute rotating mirror whose rotation is proportional to the motion imparted by the sound waves to a highly sensitive receiving glass diaphragm. The sound waves are then visible upon an exhibition screen.

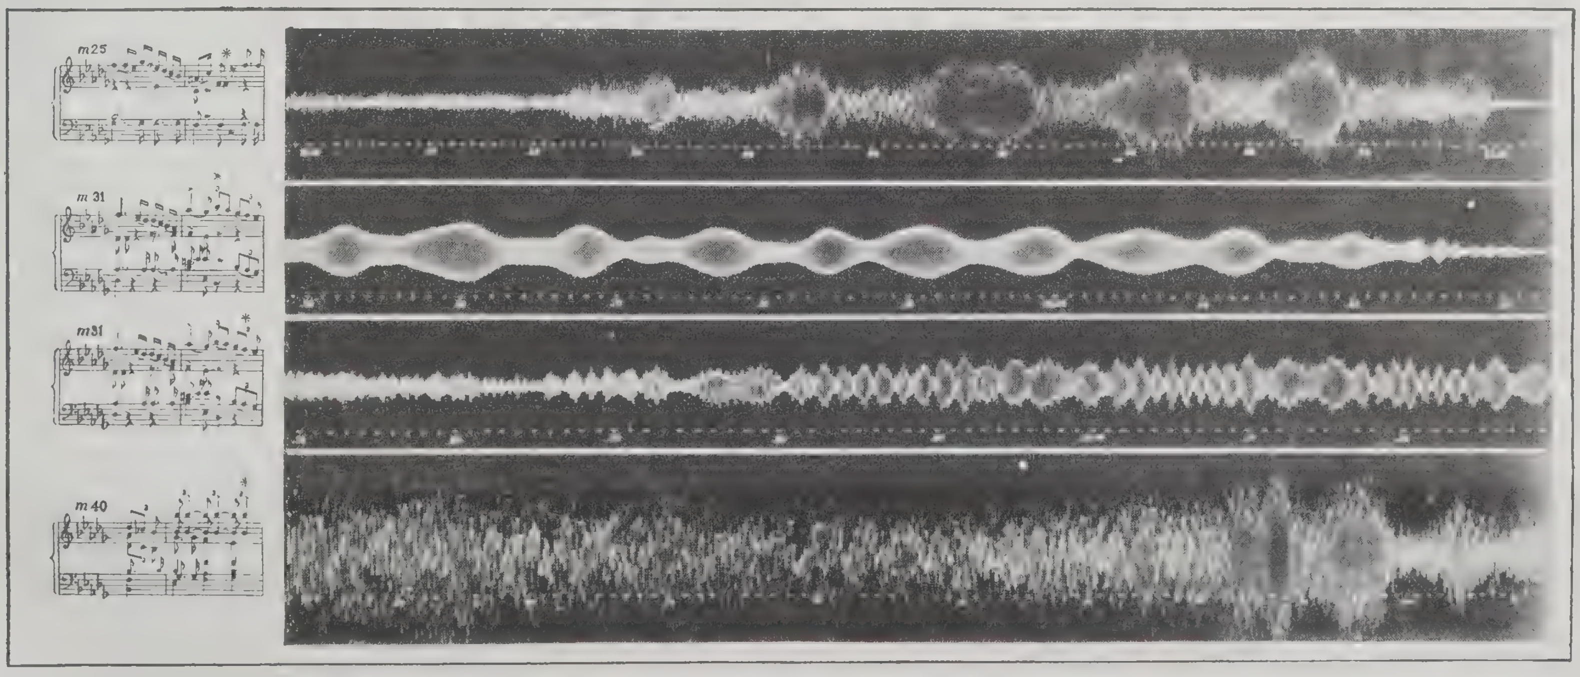


DR. DAYTON C. MILLER,

Professor of physics, Case School of Applied Science, Cleveland, Ohio; one of the world's foremost authorities on the subject of sound.



The Miller Phonodeik was invented by Dr. Dayton C. Miller for the purpose of photographing sound waves.



These photographs, made by the Miller Phonodeik, represent small portions of the sound waves created by a phonograph when it reproduces the immortal "Sextette" from Donizetti's soul-stirring composition "Lucia di Lammermoor," as sung by six famous singers with orchestral accompaniment. The parts of the music recorded in the photographs are indicated by asterisks over the excerpts from the score. The small distances between the dots correspond to time periods of one-hundredth of a second. On this basis one thousand feet are required to record the entire selection. Caruso's singing of the syllable "*chi*" created the wider portions of the upper picture. Tetrazzini's slight *tremolo* of high B-flat is depicted in the second photograph. Amato, the baritone, together with soprano voices, singing softly, are shown in the third illustration. Six solo voices singing loudly produced the fourth record.

URBANA ILL

BRIEFLY TOLD

Tradesmen's employes in Japan wear their employers' trade-mark on the backs of their coats.

The redbirds and bluebirds of Bermuda are so thick that it is necessary for those playing golf to shoo the birds off the green before putting.

Deep-water sailing ships in the old days were often beached to have their hulls cleaned of barnacles and weeds. This was called careening. It was done by scraping and burning; the fires kindled underneath a ship for this purpose were called breaming fires.

Although man has used the eagle as the symbol of strength, there are many species of seabirds that can play with a tempest that would drive the eagle to earth. Vultures in height and swallows in endurance exceed the eagle and comparing bulk for bulk the humming bird is a much more wonderful flyer.

About 312 B. C., Caesar Appius Claudius built the Appian Way. This great three hundred and fifty mile thoroughfare stretches out almost in a direct line from the walls of Rome in a southerly direction to Brundusium. Today, as in the days of ancient Rome, heavy oxen draw great loads of produce along this ancient road.

Among those elected to the new French Chamber is an Alsatian Communist who does not know a word of French and who proposes to speak in German from the tribune of the French Chamber. He was a sergeant in the Prussian artillery but in November, 1919, he publicly accepted French nationality.

The bald eagle of Alaska has a price of one dollar on its head, but fur farmers are confronted by the golden eagle which is not specified in the Bounty Act. The golden eagles will, it is feared, do much destruction among the foxes raised there.

A clock which was twenty-one years old when George Washington was born is still keeping perfect time in Omaha, and besides recording the hours, gives the days of the month, the phases of the moon, and the rise and fall of the tides. It is of the grandfather type.

A campaign is on foot at the Fort Apache Indian Reservation in Arizona to improve the living conditions of the Apache. Of all the American Indians he is the most primitive. It is probable that a number of modern houses will be erected in the coming summer.

Rare and beautiful jewels and other Hawaiian relics, which belonged to the late Queen Lydia Liliuokalani, are to be sold by public auction in Honolulu.

Live fish and shellfish, similar to those inhabiting the lakes of Palestine, have been found by artesian well borers at depths of 200 feet and 300 feet beneath the burning sands of the Sahara Desert.

One of the richest and finest of brown paints is manufactured from mummies. The paint is made by grinding the bones of the mummies with the bitumen with which they were embalmed.

Rabbits cost Australia $125,000,000 a year by eating pasturage which otherwise would feed 30,000,000 sheep.

"The International Jew," a four-volume series on the Jewish Question, may be obtained from The Dearborn Publishing Company, Dearborn, Michigan. This set includes: "The International Jew," Vol. I, 235 pages; "Jewish Activities in the United States," Vol. II, 256 pages; "Jewish Influence on American Life," Vol. III, 256 pages; "Aspects of Jewish Power in the United States," Vol. IV, 246 pages. The price of these volumes is twenty-five cents each; the complete set, four volumes, one dollar.

In 1670 a Dutch writer said that tea was ridiculed in Holland under the name of hay water, and another remarked that "the progress of this famous plant had been something like the progress of truth—suspected at first, but very palatable to those who have the courage to taste it."

On the village green at Tilford, where Mr. Snowden, the British Chancellor of the Exchequer lives, there is a tree called the King's Oak, which is mentioned as a landmark in the royal charter establishing Waverley Abbey in 1129.

The late Marie Corelli on being asked why she never married said: "There is no need, for I have three pets at home which answer the same purpose as a husband—a dog which growls every morning, a parrot which swears all the afternoon, and a cat which comes home late at night."

The fourth centenary of the introduction of cocoa into Europe is being celebrated in June.

In the Solomon Islands, New Guinea, and the New Hebrides, cannibalism is still practised in the uplands of the interior.

The walls of Babylon resisted "the gnawing tooth of time" and the battering rams of Cyrus, because the mortar used was mixed with bitumen. This bitumen is the "slime" mentioned in the Bible as being used for the Tower of Babel.

Forty wood mice, eight young grouse, and an owl were found fast on a roadbed in British Columbia one morning by workmen repairing the roadway. The wild creatures had been trapped in the oiled surface which the sun had warmed to a consistency of very thick molasses.

Confucius lies buried in a graveyard in Chufu, Shantung, his home. There his descendants, the clan of K'ung, still live. The head of the clan, Duke K'ung, as well as the water-carriers in the streets, if they be of the K'ung family, are equally entitled after death to lie within the red walls inclosing the burial-place of the great philosopher.

There is excellent trout fishing in India in the upper reaches of the highland rivers. There are also trout in Ceylon, in the Nilgiris of Southern India, in the foothills of the Punjab and in Kashmir.

In Latvia motion pictures may not be viewed by children under eighteen years of age unless there is a special picture show for children.

Smokestacks from old battleships are being used in Philadelphia for garages.

"It would be a great disgrace to us if, when our language is spreading over the world, we did not do our best to make it as convenient a means as possible for the expression and interchange of ideas. A living language is a growing language, and its growth and development are determined by those who use it in the necessary channels of life."
—*Dr. Robert Bridges.*

Thousands of radio fans heard the notes of the English nightingale radiocast from the depths of a Surrey wood recently. The birds were tempted to sing at the right moment by notes sounded on a cello by a musician seated in the wood. A sensitive microphone and amplifier transmitted the notes to the London station where it was radiocast.

The meeting of Charles H. and Mrs. Ellis, of Westwood, Massachusetts, with Postmaster-General New, at Washington recently, celebrated an unusual centennial anniversary. Mr. Ellis has been postmaster at Westwood forty-four years, his father and grandfather having preceded him in the same office, now in the family for an unbroken period of 100 years.

The old Mansion House at Greenville, South Carolina, is being razed to make room for a new million-dollar twelve-story hotel. It is a landmark of the last century and was the scene, in the seventies, of a great celebration when Wade Hampton was finally elected governor of South Carolina, ending "carpet-bag" rule in that state.

Scientists place the possible posterity of a female fly at nearly four and a half septillions, and if all lived to adult age, there would be no room for any other animate creation. Luckily flies die young.

Sixty varieties of mosquito are bred in New York. They thrive best in old cans and receptacles where water will remain until stagnant. The season is near.

Through the initiative of Sir James Barrie and other prominent men in the world of art and literature, there has been completed at Marlow-on-Thames a beautiful fountain in memory of Charles Frohman. It was at Marlow where he used to spend his holidays.

Sir Gilbert Parker addressing the Royal Society of Literature said: "There is only one test for a novel: First, a well-constructed story, dealing sincerely with human life and character; further it should reveal insight, and should be sane and healthy."

During the months of February and March the total Jewish emigrants from Palestine was not far short of that of the immigrants—611 as against 760—and out of these 611 no fewer than 529 had but recently gone to the Holy Land.

The Westminster coroner recently said: "Ladies who kiss Pekingese and other dogs on the nose and mouth, should know that they are liable to acquire the horrible hydatic cyst (a malignant growth), generally with fatal results."

The original of the "Drumtochty" of Ian Maclaren is the village of Harrietfield, three miles from the town of Crieff in Perthshire.

The Wet World Abroad—A Brief Review

England Drinks Less; Italy Restricts Sale; Five Million Take Dry Stand in Austria; Everywhere It's a Live Issue

By A. R. PINCI

ONE of the favorite protests of the anti-prohibition element of the United States is that abroad—generally meaning Europe—there is no drunkenness and no so-called narcotic problem, because the people are free to drink their favorite beverages as and when they please. This freedom is supposed to be the sure preventive of abnormal appetites of an alcoholic nature.

As a matter of fact, moderate drinking, as it was known in the United States relatively few years ago, is on the wane in Europe. The middle classes are drinking less than ever, voluntarily or because of the prohibitive costs of genuine light wines and beers, notwithstanding that statistically the consumption of such beverages tells some contradictory tales.

Let's see just what is being done by the world in the way of temperance, which is the first step to prohibition, and prohibition itself.

Britain has been drinking less whisky, according to the latest report of the commissioner of customs and excise, than in any year since the war, with the exception of 1918-1919 when production was curtailed.

Poland has moved toward prohibition by the organization of a governmental commission to restrict the liquor traffic, under the general direction of the ministry of health.

Switzerland Has "Local Option"

SWITZERLAND has witnessed the success of a movement—duly approved by the requisite number of voters' signatures—the effect of which is to empower any Swiss canton or commune to prohibit within its territory the manufacture and sale of all alcoholic and distilled liquors.

Austria, by means of fraternal organizations, like the Good Templars and the League of the Cross, has recruited nearly 5,000,000 persons favoring prohibition. President Hainisch, of Austria, is chairman of one or two prohibition organizations.

Italy is beginning to stir after the repeated warnings from the national department of health against alcohol. One of the first acts of the Fascist government was to plan for the restriction of wine and liquor selling establishments—by street blocks and districts—and increase the taxes upon all such beverages. This decision is said to be the cause of some sabotage on the part of a well-organized and well-financed minority whose handiwork, according to latest advices from Italy, is perceivable in internal politics there.

Norway is having a great deal of trouble with prohibition. Prohibition is the major sentiment of the Norwegian population, but foreign countries, with booze to sell, have been endeavoring to coerce that kingdom into buying it, under the operation of tariff and reciprocity treaties.

Sweden held in August, 1922, a referendum regarding an extension of laws, with a view of jumping to total prohibition the somewhat severe regulatory laws on liquor sales, but found, as in the case of Norway, that foreign interference might retard the good work. The measure was lost by a two per cent majority.

Turkey, held up to scorn and diatribe by all those who profess to find un-Christian some conduct for which neighboring Christians are responsible, has a prohibition law which provides that offenders occupying government positions shall forfeit their offices; manufacture, importation and sale of spirituous beverages will mean fines and imprisonment, without appeal from said decisions.

Even South America Is Awake

ICELAND and Finland, economically subjected to wine-exporting nations like Spain and Portugal and France, have been disturbed, with the government endeavoring to compromise under the terms laid down by foreign governments to save the local export fish market, while the prohibition forces are taking the opposing view.

Czecho-Slovakia is booming prohibition. A petition in favor of it was signed in the city of Prague by 750,000 persons, and a semi-official cast is given to the movement by President Masaryk being honorary head.

Russia, whose chaotic conditions can not be properly assayed, found that much vile booze was being surreptitiously made and sold, and according to late advices the limited manufacture of vodka may be (or has just been) authorized, the income from its sale to be devoted to building up the schools. This, of course, seems like robbing Peter to pay Paul, but Russia for the time being faces problems whose solution measures can not be safely assessed from our standpoint.

Germany is said to be wetter, but the beer being sold there, according to experts, is of generally inferior quality, as compared to before the war, so that one increase offsets the other; in addition, much of this consumption, charged, of course, to German statistics, is due to the constant influx of foreigners—Italian, British, French, Swiss, and others—whose drink bills make up a fair total from which the German population must be absolved.

Jumping to South America—and that continent has been advertised as being prohibition-proof, even if the rest of the world is as dry as alkali itself—one finds that Argentina, Brazil, Chile, Paraguay and Uruguay, are anything but anti-prohibition advocates. On the authority of Miss Anna Adams Gordon, who visited there as president of the National Women's Christian Temperance Union, prohibition is "a live issue" there. "Until making this survey of five republics," she observed, "we had not adequately realized how energetically and intelligently leaders in educational, government, church and social reform circles were pushing anti-alcohol propaganda."

According to Dr. Reinhard Strecker, president of the Central Committee for Prohibition in Germany, "the anti-alcoholic movement has developed into a world-wide war against the drinking habit. It had its origin in the military World War, and is one of its few beneficial results that may weigh something against the untold miseries with which it afflicted all mankind."

It may be remembered that when Lady Astor had an amusing tilt with Premier Lloyd George in the House of Commons, the subject under discussion was the matter of housing. The Prime Minister was bragging about the fact that England was doing more toward housing than the United States. "What," he asked, "has America done?"

"Gone dry," retorted Lady Astor.

One-third of Italy's alleged emigration problem can be wiped off overnight by reducing the national wine production and growing more vital foodstuffs. Italy can not hope to consume, not to say drink up, all the wine and special drinks it manufactures. The same must be said of France. In the same category belong Spain and Portugal.

Economic Considerations in Europe

WITH these four wine-producing countries turning out more stuff every year than the world can or cares to absorb, the result of this economic stalemate is evident. France and Italy, especially, have by means of official and diplomatic pressure endeavored to induce the United States to modify its prohibition laws to the extent of permitting a higher alcoholic content than the law now in operation. As the American Government failed to heed the hint, other markets had to be sought. Italy has not figured very prominently in these exports of late, but France, Spain, and Portugal, unable to coerce the United States into a modification of laws to admit the entry of their beverages, did not hesitate to bring pressure upon weaker nations—or nations economically subjected to them—for preferential treatment. England, exporting less liquor, has boosted the price. England has been sending about forty per cent less drink by volume to the United States, but the price went up during the same time 200 per cent! The advantage is all on England's side.

The so-called wine year of France has shown that the 1922 harvest has been the largest in nearly fifty years, falling short by a few million hectoliters of the record of 83,000,000 hectoliters in 1875. French production, therefore, has been about 2,000,000,000 gallons, including the Algerian and Tunisian wine yields.

Spain and Portugal, which have been noted for their exports of port and sherry wines—in reality strong table wines that fail by little of being "high-kick" drinks—in effect if not by scientific alcohol content—have been endeavoring to ease the market for these wines by customs reprisals threats. The Spanish dictum has been that the prohibition laws of certain Nordic nations be altered to admit of importation and consumption of Spanish wines "below twenty-one per cent of alcohol."

Sweden barely prevented a total prohibition law, according to the popular vote of last summer, but as the majority is increasing on the side of the prohibition forces, it is wondered how long the present law will stand. It has been announced that fifty-seven per cent of the women favored prohibition of the manufacture and sale of beverages containing more than two and one-quarter per cent of alcohol, while sixty per cent of the men were against the proposal—a margin that is too unsafe to give the drinking element much hope.

A Question of Wine or Food

IT IS obvious that the true intent of part of Europe in regard to prohibition is obstructed in various ways, which, of course, leads to the presumption that if obstruction on the one hand, and economic compulsion on the other, ceased to operate, the true index of average European prohibition idea would weigh heavily on the latter side.

It is not easy to change countries that for centuries have almost exclusively been devoting themselves to grape-growing and wine-making to substitute production, but there is no doubt that those countries, having failed to keep pace with the constantly increasing divergence between raising of foodstuffs to keep up with the requirements of the population, instead of catering to their drink desires, are now expiating their economic fallacies.

Europeans, especially in the latter countries, declare that their wine production is not regarded for beverage purposes for the population producing it, but that most of it is intended for export, which, in turn, would compensate for other and more vital imports. If this were so, economists of those nations should have prepared for the change, which has not been as sudden as the advent of American prohibition makes it seem.

In the view of the very temperate, officially speaking, Fascist authorities in Italy, the present lopsided situation leads to many interrelated evils, the chief of which is that too much wine in the country means too many retail selling emporiums in the cities and towns, with consequent absorption of drinkables that is regarded as excessive. Less wine would mean more country soil to till for more utilitarian purposes, fewer men (and women) in urban centers, and a general improvement all around.

Where Has the "Good" Wine Gone?

YET the middle classes—the bone and sinew of those nations—drink very little, and diminishingly so. The number of non-drinkers in Latin European nations was never inconsiderable, among those classes. It was always considerable in the Nordic countries. These have outrightly leaned to prohibition, more or less, actual, conditional or future. The Latin countries made little headway in this direction, but the white-collared class is drinking less than ever. The very rich drink their own products and much imported sparkling wine, and the laboring classes can not, of course, by themselves drink up all that is produced in their countries.

To add to the mystery, it is virtually impossible to go into commercial retail shops in any of those countries and obtain pure fermented grape juice, the true wine of former times. There are "cobwebby" bottles, fancy labels, mysterious names, crests and medals—but the wine is generally impossible. In the vulgar shops the fancy trappings are dispensed with, but the wine is no better.

The popular satirical criticism of these wines, from Algeciras to Brindisi, is that it is "made with a stick." Every cartoon and verbal lampoon attests to that. You can go into any of those shops and the average cheerful drinker, after clucking his wine-bathed tongue between cheeks, will laugh to his friends or the waiter or mine host as he remarks that the "taste of the stick" is not bad.

Unless one knows the ropes, or is a favorite customer, or has his supply from the vineyard direct—and the vineyard "salts" its wine by brining it financially—good, "sincere wine," as the Europeans call it, is not easy to get. But where does it go?—hundreds of millions of gallons of it, allowing for depreciation, loss, distillation, export—what becomes of them, if it can not be bought locally?

That's what every European wants to know.

And that is why Latin Europe's better classes are giving up wine. It is a problem to get it good, it is too expensive at present for the average purse. Rather than drink doubtful wine they drink pure water.

Another phase of this European drink problem, which varies with nations, is the bond between alcohol and the state's income. Alcohol, regardless of its beverage cover, is a tax source from the moment it leaves the earth in vegetable form to the moment it is drunk. Every step is a tax. Even the bottle or flask label bears a revenue stamp. To say that the governments, local or national, do not face a fiscal problem in regard to temperance or prohibition is to ignore the very fabric of those governments.

Prohibition and the Drug Habit

IT IS a matter of courage, especially in currency-depreciated countries, to smile officially in favor of the prohibition movement. None admits that it will not be a self-compensating boon in the future, but the problem is with the present.

American anti-prohibition propaganda has it that the growing narcotic habit in the United States is due to the Volstead Act as well as the Eighteenth Amendment. But "stupefying drugs," as the Europeans call them, are being widely used there. The cocaine and heroin traffic in some places—and especially cities—is unbelievable. Jewellers there feature tiny vanity cases for women, and imitation watch lockets for men, for the handy concealment of drugs. Aged men about town say that in certain fashionable places it looks as if the snuff-age had returned—with the constant scenes of inhalations from "thumb-and-index" fingers dipping into these variegated receptacles.

One is not aware that Nordic prohibition countries are actually in the throes of the drug habit. At least, medical authorities have failed to sound the alarm, but the habit is insidiously growing in those countries where prohibition, judging by appearances, would seem impossible. If dry America leads to drugs, who will explain why wet Europe is experiencing the same trouble?

The Ricsha Man of China

He Sees in Every Newcomer an Easy Mark

By MRS. L. M. CRAMER

DIRTY, ignorant, naive, and with it all more or less picturesque is the ricsha coolie of China. He is the most popular means of transporting a person from one place to another to be found in the "Middle Kingdom." We could not get along without him, and we can't always get along with him. He is a product of the Orient; please God he may never invade the Occident.

The ricsha coolie is a peculiar chap, holding a philosophy of life all his own. When the day is dark and rainy, and the mud is as slippery as soft soap and as sticky as glue and you need him, often he is not to be found. There comes a day when the air is balmy and spring-like, and the sun shines, and the out-of-door world beckons you for a long walk, and there he is at your side the minute you step outside your own gate. He is at your side and he stays there, trotting along block after block, calling softly, "Ricsha, missie?" as though it were a secret between you and him, until after a time, in sheer desperation, you nod and climb up into his ricsha and wave your hand in the general direction you want to go.

The ricsha coolie has an uncanny sixth sense; he knows at a glance whether he can bully you into paying him too much, or whether you are going to hold him down to the last copper he can justly claim. He has much more respect for you if you do not overpay him. He knows, too, whether you are going to be afraid of him if he does bully you, or if you will be apt to wrap your walking stick around his ears if he tries it.

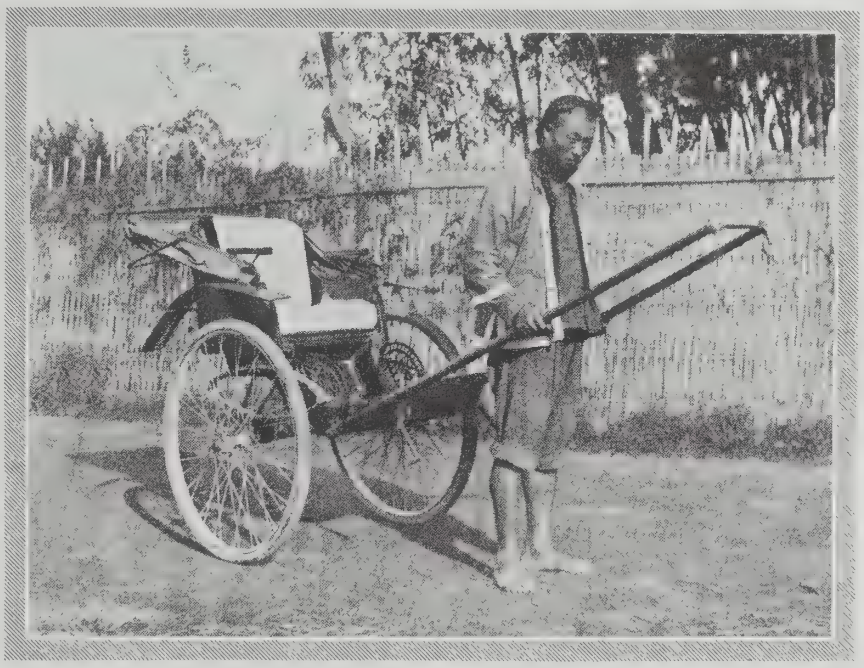
It is said the ricsha coolie originated in Japan; when or where or why I have never been able to discover. The Japanese ricsha coolie is admittedly mentally superior to his Chinese brother, and I am willing to concede that he is far more cunning and crafty and smooth than any Chinese coolie I ever met. One worked a nice little scheme on me and did it so cleverly that I didn't wake up to what had happened till twenty-four hours afterward, and by that time I was halfway across the Inland Sea, one of the beauty spots of the world, and too filled with the wonder and beauty of it to resent the trick. But had a Chinese ricsha coolie tried to work the same game, anyone would have known instantly that something was up, because he would have given it away in the homely honesty of his dirty face.

I had my first ricsha ride in Kobe. I wanted to go to the art section of the Satsuma works, where I could see the native artists decorating the pottery in all its different stages, from the first inlay of color and gold to the last touching up before the final firing. The card which was to introduce me to the master had implicit directions as to how to get there written in both Japanese and English. At the Imperial Hotel they had recommended this particular ricsha coolie as being very bright and absolutely trustworthy. The coolie knew—knew very well, he declared in good English—the place to which I wanted to go, and would take me there and back for a certain number of sen. The bargain was made, I altogether unsuspecting that he was charging me exactly four times the regular fare.

According to the directions, the factory was on the edge of a small forest, surrounded on three sides by wooded hills, and near by a waterfall. This waterfall was one of the beauty spots of Kobe, and close to it stood one of the famous shrines of Japan.

Up one street and down another the swift-footed Mercury flew, occasionally turning his head to grin at me in a reassuring manner. Suddenly, and with a great flourish, the ricsha stopped in front of a stuffy little shop on one of the most crowded streets. There was no waterfall. There was no forest in sight. I saw no shrine. I pointed to the card with its pictured factory, and shook my head. "This is not the place," I said determinedly. The ricsha coolie suddenly could understand no English. I tried to express my thoughts by means of pantomime. I motioned to him to go and find the woods, the waterfall, and the shrine, and incidentally the Satsuma art department. Then with a trusting smile he reached for my hand to help me out of the ricsha. I sat fast. Then he rushed into the shop and brought out a small piece of Satsuma ware. There was no discounting the fact that it was Satsuma, and I was won.

Bowing with the grace of a Lord Chesterfield, and with a deep sweep of his dirty straw hat, I was invited to remove my aged and honorable self from the ricsha and ascend a flight of very unstable-looking stairs to where the "factory" presumably was located. Suddenly my chauffeur had regained his command of broken but understandable English. Into a stuffy little room I was ushered, and shown lacquered wares when it was Satsuma my soul yearned for. I protested and was given to understand that if I would but look about the humble shop and see their wares I would be taken to the Satsuma factory near the waterfall, hard by the cool, green forest. I was persuaded. Also I bought some of the lacquer ware, paying far too much for it.



China's ubiquitous ricsha, drawn by coolie power, ready for a "fare."

On three different occasions was this performance repeated. I bought kimonos, fans—silly toys from as many different shops. I did not want them then, and I wanted them less on the morrow. Finally I grew so exasperated that I demanded to be taken back to the hotel and was taken instead to the Satsuma art studios. Thinking it all over now, in the light of much I have learned of the Oriental since then, I can see that it was all a game, and I was "it." I was accorded the same experience extended to other tourists provided they are silly enough to submit to it. I was taken where I did not want to go, and I bought what I did not particularly want to buy. There must be a reason, and that reason undoubtedly lay in the amount of cumsha (graft or tip; call it what you will) which the ricsha coolie received from purchases made by every unsuspecting tourist he was able to land.

Picturesque Chinese conveyance that delights the youthful rider.

You think you are going to feel very silly when you climb into the overgrown baby carriages which are ricshas in the Orient, and you do feel that way for a minute; and then you forget that you have not been riding in ricshas for years, and you settle back with the air of a grande dame, lacking only the lorgnette to make the illusion complete. Some one, I have forgotten the name at this minute, has said that when she entered her first ricsha and let the coolie close her in with the black curtain, she almost imagined she was a corpse at the head of a funeral procession, and that all that was lacking was the wreath.

Chinese ricsha coolie.

The Japanese ricsha coolie is a plutocrat compared with his Chinese brother. He dresses better, for one thing. The Chinese coolie is in rags and barefoot in winter, and in summer he wears practically nothing—a little cloth draped about his middle and flapping about his bare legs is all he craves. In winter, in rags through which one sees his bare brown skin, he is a pitiful sight. Over-compassionate foreign women sometimes give whole new outfits, including shoes and stockings, cap and mittens, to some ricsha coolie who has excited their sympathy, and much has been their surprise to find the same coolie in rags the very next day, his bare feet blue on the cold pavements. The chances are that he has sold the good warm clothing for a few coppers, and that he has spent his new-found wealth in some game of chance. Sometimes he puts away the newly acquired clothes against a day when there shall be a funeral or a wedding in the family, and he may want to dress up, or when he, as the corpse, would do honor to his family by being well clad.

He is perspicacious, is the ricsha coolie of China. He knows a newcomer to the Orient and delights to get him for a fare, because when it comes to pay, the newcomer is usually an "easy mark." He has given you good service, you think, and you feel that perhaps the sum set by the older resident as sufficient to pay him is too little recompense for the distance he has trotted with you, and so, instead of paying him ten cents and two coppers, you pay him twenty cents and four coppers; and right there you have started something! He talks and he talks loud and fast. It is all Greek to you, but you sense that he is terribly excited and that he is jumping about threateningly. He sees the look of growing fear in your eyes and he bellows the louder. He knows that he has been overpaid, but he reasons thus: "One piecie fool missie pay too much. Could pay more. Have got coppers. Can do," and he yells and yells till a crowd of other Chinese coolies gather about you and you give him all the coppers in your purse and make a rush for the sheltering door of your pension. He subsides in his rumpus only when he is quite satisfied that the last copper in your purse has crossed his own dirty palm, and that it would be futile to yell any longer. Sometimes if he does not feel quite assured, when you run for the door, he also runs, yelling constantly for more coppers. He beats upon your door if you have been fortunate enough to close it in his face until you get a new appreciation of that day in Gaza when Sampson found his revenge.

Pay him too much and he will make scarcely less commotion than when he is paid too little; but pay him the exact amount which should be his, and he will tip his hat, if he has one, or pull his forelock and grin as he says "Missie," which is his way of saying "Thank you very kindly."

The ricsha coolie is an eternal question mark to me. Let him tell the story and he knows every nook and corner of the city. Down by the Bund in Shanghai you may pick up a stray ricsha coolie, as I did one day, and give him a number out in the French Concession to which you want to go. "Savey?" you question him, and he will grin and say "Can do, Missie." Reassured you climb into his ricsha and ride for what seems like an unusually long time and suddenly you look about you and discover you are in a part of the city you never saw before. Gently you tap him on the shoulder with your walking stick, and repeat "Avenue Joffre, coolie. Savey?" "Yes, can do," comes back the reply, accompanied by a cheerful smile, and shortly afterward, by his aimless wanderings, you realize that both you and the coolie are lost. You hail a native policeman and explain the situation in your best pigeon English. You tell him you want to go to Avenue Joffre, and will he please direct the coolie, who is apparently lost. After several minutes of explanation on your part, the arm of the law will point to both ears, one after another, and shake his head. He has not known whether you were complaining about the weather or complimenting him on his nifty appearance. He does not savey and he does not care. Let the foreign devil stay at home if she does not want to get lost in Shanghai.

You accost one native policeman after another, but all have ears to which they point with the utmost indifference to your growing uneasiness. Then from a distance comes the red-turbaned head of a Sikh police-

James Lane Allen—Phantom of the Blue Grass

Visit to the Home of True Interpreter of Old Kentucky

By HARRY E. BARNET

YOU have some queer adventures when you poke around in the youthful haunts of living southern writers, and among scenes and characters of their stories. But nowhere do you get the feeling that comes when you vagabond it in the Blue Grass region of Kentucky—the home country of James Lane Allen. Because:

It is an emphatic literary shrine. The region grows lush with romantic facts. Born into them—absorbing their atmosphere—Mr. Allen has turned these facts into famous tales. So that when you read his stories, you not only wander for the time in the whimsical gardens of Blue Grass history, but you also ramble in its figurative weed patches.

"I have always worked in the spirit of the region of the Blue Grass," Mr. Allen says. "Always avoided the 'spot,' and tried to capture the spirit, which is all spots."

Throughout the year, you find, in the Blue Grass region, men and women from all parts of the world who go there for no other purpose than to search the scenes of Mr. Allen's stories; "literary pilgrims," they're dubbed in the region. But no general description exhausts the varieties of them. They run the gamut of human types—from hard-headed business men to young girls, whose sketchy apparel and appearance belies their seriousness. But their number is great—growing greater each year.

One of the "pilgrim" rites is to re-read favorite stories in their native settings. To do this, hundreds bring their pet volumes. Other hundreds fall back upon Lexington's public library, and they keep its bountiful supply of Mr. Allen's books constantly on the move. Copies of "Blue Grass Region of Kentucky" come in for the hardest wear.

Now the Blue Grass region is very old, and like old regions elsewhere in the United States it is changing from ways of yesterday to ways of today. But the shift is slower in the Blue Grass. On that account, the "pilgrims" find local color aplenty.

She was a "pilgrim" from New Orleans, en route to the James Lane Allen country. When the train pulled out of the station at Danville, she seated herself upon the platform of the observation car, and intently studied the passing landscape from that position.

"Thea's a hemp field," she soon exclaimed.

"How do you know it is?" asked her companion—an elderly woman. "In all yo' life you nevah saw a hemp field."

"I know it from Mr. Allen's description of one," she replied. "It's the fall of the yeah, and the field is exactly as he describes a hemp field. The stalks cut, and bunched, standing upright, like Indian tepees—"

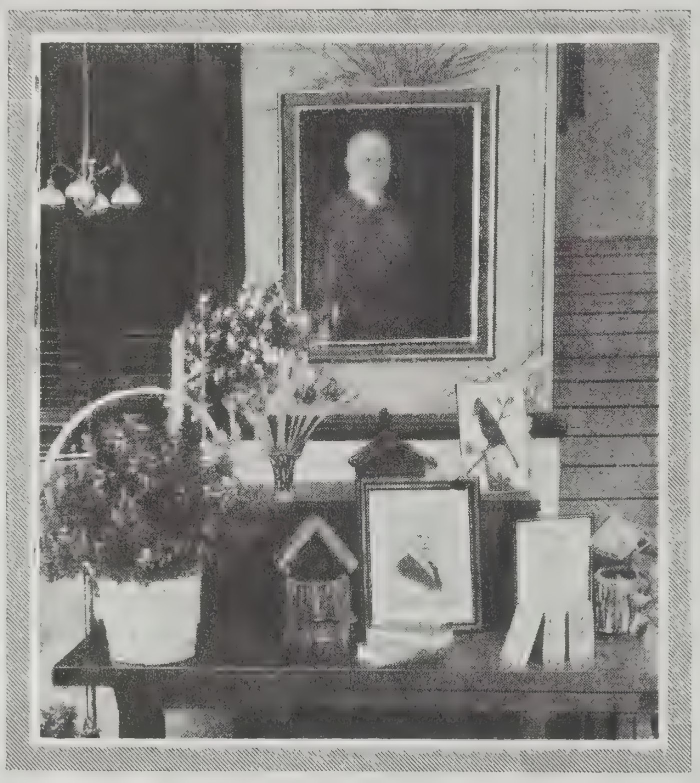
James Lane Allen is an overcast element in all of this literary conspicuity of the Blue Grass region. There is where the odd feeling originates. His personality is not clear-cut. Rather, he is a spirit—stately, in keeping with the peculiar quaintness of his country—a stately spirit, let into the Blue Grass region to absorb the substance of its romance. Led, then, elsewhere to work out the record.

The record dominates in the Blue Grass region. There it is the vivid thing. When you look about his old stamping grounds to scrape up acquaintance with the juvenile James Lane Allen, and with the younger, human, and mature Mr. Allen, your most insistent sensation is that of traipsing in the trail of a phantom.

A sensation is best explained in a comparison. Irvin S. Cobb is issue of the "Purchase"—that part of Kentucky in the whereabouts of the ingathering of the Mississippi, the Ohio, and the Tennessee rivers. History of the "Purchase," and that of the Blue Grass are comparable—a texture of romantic facts in each case, that is to say. Mr. Cobb uses these facts as Mr. Allen uses the facts of his country. And both Mr. Cobb and Mr. Allen live in New York City.

But talk in Paducah—his home town—and throughout the "Purchase" constantly bubbles of Mr. Cobb. There he dominates. In his own country, he is a vivid personality. He frequently goes "back home," and keeps it vivid. The record he has made takes a back seat. It is Cobb, the person, that comes to the front. Mr. Cobb's birthplace, for instance, is marked by a bronze plate. And yet in spite of the memorial flavor of the bronze plate, it is as if Mr. Cobb were just around the corner, and for a moment or two before you meet him face to face, the grown-up, lively lads of Paducah "give you a line on him." You hear of the girls to whom he was attentive. Particularly, about "Irv's" tremendous appetite; fishing trips; hunting expeditions; miscellaneous doings of young fellows in unusual environment. You meet with men and women who are characters in his stories. Moreover, you have pointed out to you descendants of dogs and horses, even cows he knew and wove into his stories. The younger generations of these animals carry themselves with an air as if to say, "Well, by gum, look who our great-great-gran'-pappies-and-mammies were!"

Although physically he isn't there, Irvin S. Cobb lives in his own country—jovially. You have the idea.



Audubon Day is celebrated in Lexington schools, and its public library. James Lane Allen is remembered because of his writings about Kentucky birds. A corner in Lexington's public library, on Audubon Day, showing oil painting of Mr. Allen that is a permanent feature of the library.

At no time in the Blue Grass region do you get the notion that James Lane Allen is just around the corner. No one prepares you to meet him face to face. If you want to "get a line on him," you have to scratch gravel—and do a good job of scratching.

His birthplace, as an illustration, is matter for argument. Some say it is one place; others say it's another place.

For THE DEARBORN INDEPENDENT, Mr. Allen settled the question.

"I was born, upon the word of my mother, in a house which burned down before I was old enough to remember it," he stated in a letter.

"Another house was built upon the spot," the letter continued, "and this house was known as the Poindexter Place (Parker's Mill Road).

"The family moved across the country to the house where I spent childhood and youth—the five-room brick house bequeathed to us children by my grandfather, to guarantee a roof over our heads until we were grown," he added. "A very fine house for Kentucky, built far back in pioneer times in the wilderness—and a very fine house for its time. Wide porches surrounding it doubled its capacity—on the Headley estate, I think."

In his own country, you hear about "A Kentucky Cardinal" or "Aftermath"—his word, in other words; seldom about the man. You don't, for example, hear the like of this in the Blue Grass region: "Jim Allen! Why, he was a whale of a fox hunter when he was around here, and he did a lot of flying around with the girls in this town—"

Nor do you hear about the times when he "whooped 'em up" in one way and another with the boys, nor about his skill as a poker player. Sooner or later, in Paducah, talk about "Irv" Cobb runs to these topics. Mint juleps and toddies—themselves a bit of Blue Grass romance—are never mentioned.

Yet James Lane Allen knew what then was going on, and what now is going on.

"The difference between young men in my day, and young men now," he recently observed, "is that when I was a young man, the boys went out and had a good time. They could drink and have a good time, and be red-blooded men, and yet know when to stop. Now they go out and get drunk, and they are gentlemen no longer."

Mr. Allen is a bachelor. If he had any youthful love affairs, he kept them jolly well under cover. You hear the merest whisper of a lone romance. And what you hear about it is less luminous than a beam from the young moon.

Of course, James Lane Allen has a lot of sentiment in his make-up. Otherwise, he never could have made the Blue Grass region a literary shrine. In his youth, you're told, he was very fond of dreamy, romantic piano music.

Then girls didn't always meet you at the door with their hats on—"To-the-dance, kid!" stuff simply wasn't. When you called upon a girl, there was a bit of dignity about the affair. In her own home, the girl played dreamy, romantic piano music. You listened to it . . . ."

Well, as far as you can find out in the Blue Grass region, James Lane Allen had no regular music lessons. But he learned to pick out his own piano music—a Schumann slumber song, for instance.

James Lane Allen, however, wasn't a stick in back yonder days.

"Years ago," you hear in Lexington, "Allen and I were on our way from New York to Boston. We took one of the Fall River boats during a time of a Grand Army reunion in Boston. The boat was so crowded that neither one of us could get a berth, and we sat up all night. There must have been 15,000 old Union soldiers on board.

"Allen and I were standing on the upper deck, and down below a band was playing. They played all sorts of battle airs. I dropped a note down to the leader, asking him to play 'Dixie.'

"In those days, 'Dixie' wasn't much thought of, you know. After a while, the band struck up the tune. Allen and I both pulled off our hats, and yelled. We were the only two on board who did yell.

"Allen turned to me.

"'Let's yell again!' he said. 'What do you say?'

"I said, 'All right!'

"We did yell. With the same result. And you don't know how lonesome we felt."

Lexington preface to a glimpse at Mr. Allen's temper is this: "We used to play croquet together, and both of us would get so mad! Very often we would throw down our mallets, and leave the ground. I would go one way, and he would go another, he would be so mad."

James Lane Allen had animal friends. Tip, a tremendous yellow dog, was one of them. For about two hours after breakfast each morning, with "Tip" at his heels, Mr. Allen walked in a stretch of woodland that since has been cut down and replaced with Lexington homes.

"Tip is a gentleman," Mr. Allen observed. "I never like to walk with men when I'm working out my plots, because they interrupt my thoughts. But Tip never presumes. If I say anything aloud, he responds with a simple wag of his tail."

There were, too, an old cow, and a flock of chickens. Mr. Allen was fond of them. But you don't, as in Paducah, have descendants of dog, cow or chickens pointed out to you . . . .

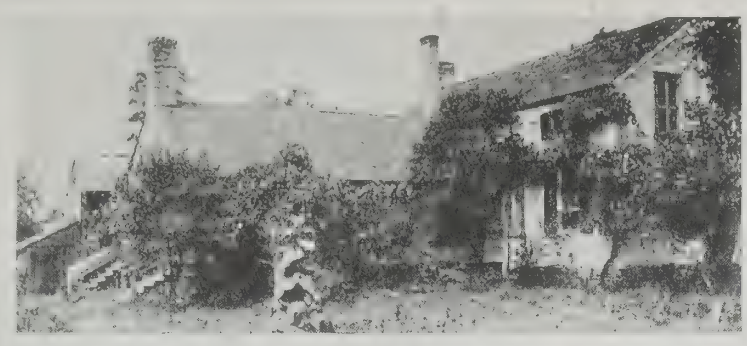
If it were possible to point out the offspring of Blue Grass birds, however, there'd be a different tale to tell. Mr. Allen knew generations of them—because his mother, it is said, always talked to him about the birds of his home country, which is why he put so many of them into his stories. He studied the birds of the Blue Grass region.

Lastly, Mr. Allen taught school. This period of his life is summed in comment of a few of his former pupils: "He was strict as the very devil." One, who now is a sedate father, added: "He gave me the darndest lickin' I ever got when I was a boy, and going to school to him. It happened in a building that stood where the building you see over yonder now stands."

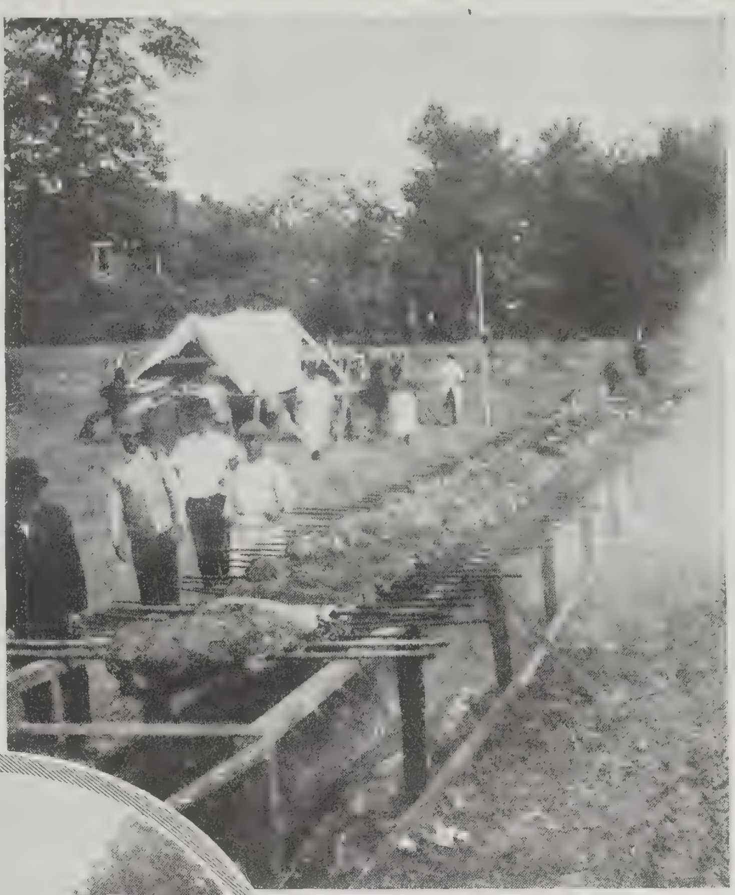
But why this sensation of chasing a phantom Mr. Allen in the country he turned into a literary shrine? Here is the reason: Mr. Allen knew what he wanted to do, and he stayed with it until he did it. "He's admired," is the Lexington statement, "because he got right down to work. He deserves what he got, because he worked for it."

There you have the highest spot. It is surrounded by several other high spots. One of them is his unusual character. He is finely attuned to harmony and beauty. There was aplenty of the natural sort of both in the Blue Grass region when

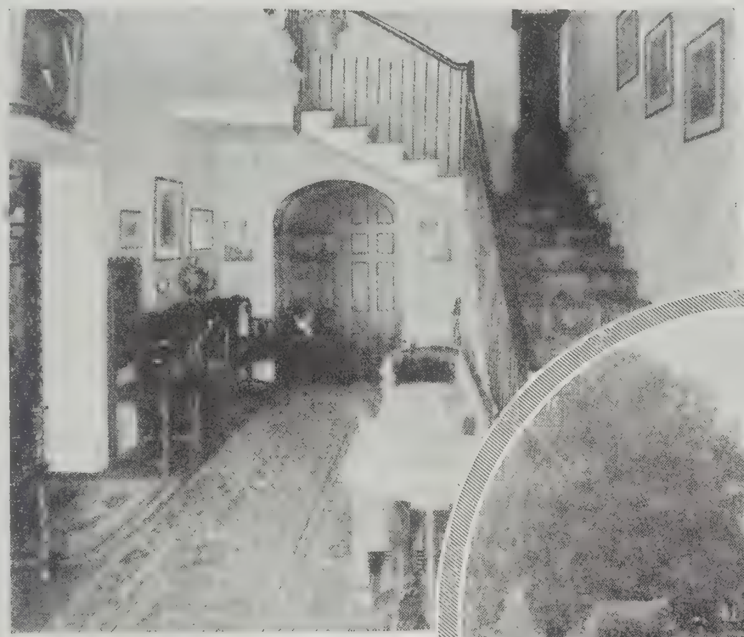
(Concluded on page 6)



"Allen house" on Parker's Mill Road, which was built on the site of the house in which James Lane Allen was born. The first house was burned down.

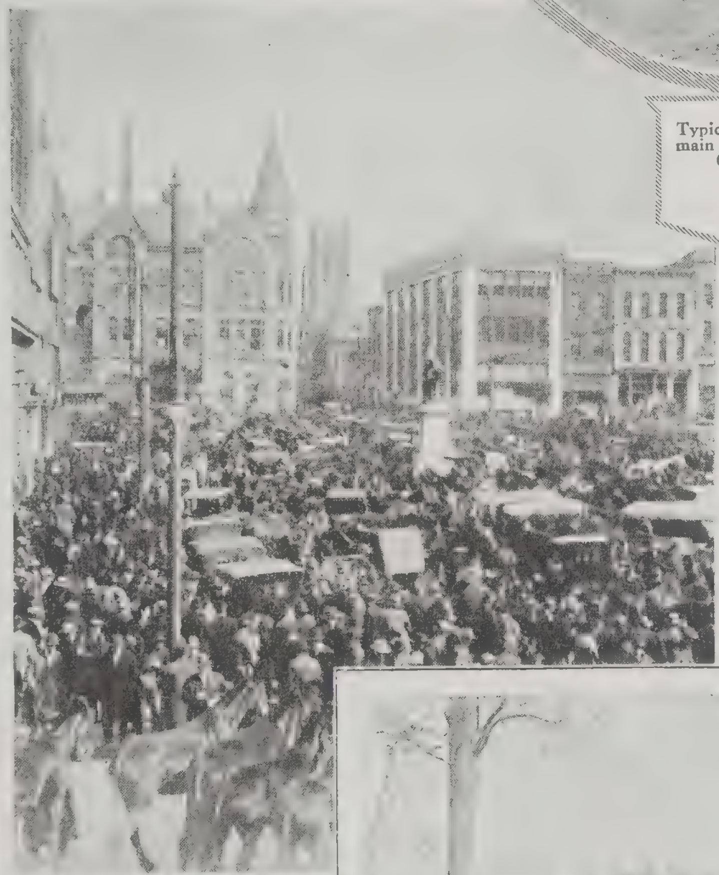


Barbecue day—Preparing the meats. One of the momentous days in the lives of the people of the Blue Grass region.

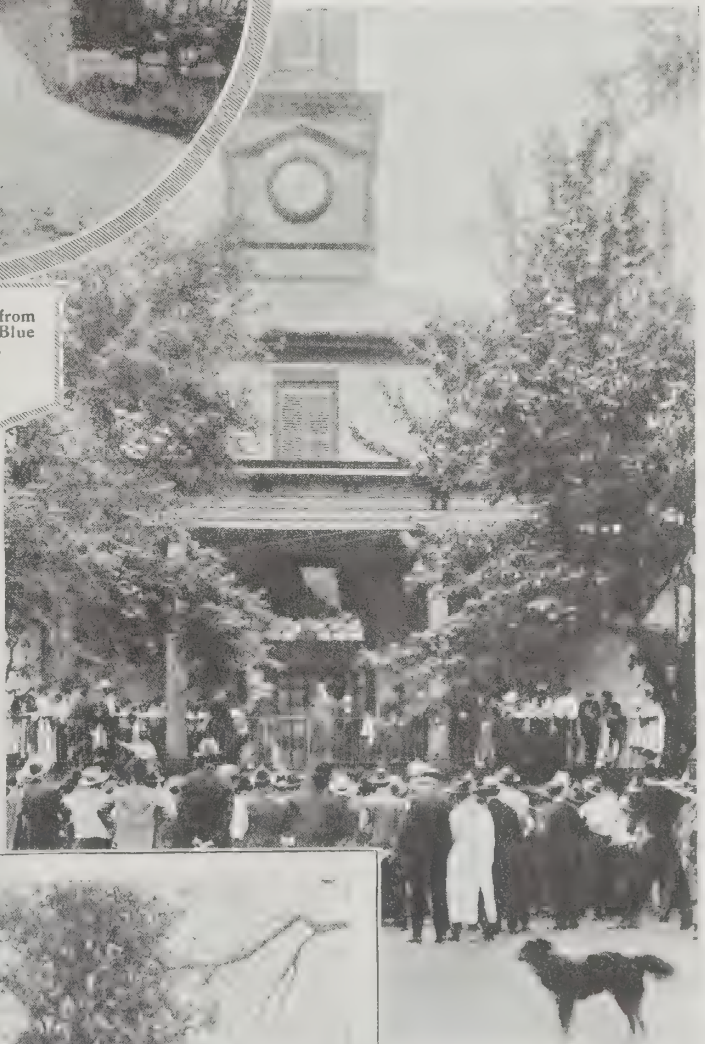


Interior of old Blue Grass home. One of the fine old Kentucky homes, built far back in pioneer times in the wilderness.

Typical entrance from main road to a Blue Grass home.



Busy day in "Cheapside," Lexington, Kentucky, where for generations people have met and traded most everything pertaining to home life. "King" Solomon was auctioned to the Negro woman on "Cheapside."



"Court day" in the Blue Grass, mentioned by Mr. Allen. An occasion on which the square in front of the judicial building was thronged with interested citizens from near and far.

Hemp, harvested, and stacked in "tepees," with a big "council house" in the foreground.

James Lane Allen

Concluded from page 4

he was a youth. He had the advantage of being born into the brilliancy of it.

But he voluntarily kept away from the distractions of the brilliancy. Mr. Allen wanted to write of the Blue Grass region. Writing is a one-man game. Therefore, he organized himself in orderly fashion. Then he developed his sources of raw material.

"They were of all sorts," you're told in Lexington.

Your attention is focused to excerpts from a letter, written at the time his picture was unveiled in the Lexington public library:

"He had but to walk anywhere out-of-doors to find his feet were in the warm footsteps of heroes. Every peaceful town he visited had been a perilous camp, fearing for the night . . . . he could not wade across a stream that had not been a crossing for progress, for some adventure of life or death . . . . the whole land was an imperishable gift to him for their victories and virtues.

"Hardly had the wilderness been won by physical hardihood as a foothold of physical safety before the people turned their eyes and their affections back toward the older settlements, and with incredible efforts began to draw over the mountains to themselves the gentler elements of civilization, the symbols of the imperishable elements of the human spirit; respect for religion, respect for learning, respect for law, respect for fireside and country—from every quarter reinforcing for themselves the solidarity of enlightened American citizenship. . . .

"The first movement had been a conquest of the land for civilization; the second had been a conquest of the land by civilization. And throughout both of these movements, wherever the hand of man strove, the hand of woman strove; to whatever advance his foot reached, to that advance her foot reached; all that he dared, she dared; all that he endured, she endured; she never his equal, he never her equal; each the other's superior as nature meant, and always means."

War between the states "compacted" the two conquests of the land—for and by civilization. It "pressed out of them a significance fresh and wonderful, a virtue that had just been added to the massed strength of the nation . . . . work of the dead in a legended land" was perpetuated. The idea of doing this "communicated itself from mind to mind as a spark from tinder to tinder, until it became one living flame—the fire of a whole people."

That's the Blue Grass region. James Lane Allen mined it—thoroughly. "You could find him, most of the time, browsing around among the old journals and papers in the library—reading everything he could find about his country," sums up a world of hard work in a sentence.

Then Mr. Allen had trouble with his eyes. But he had a great deal of fiction read to him. At times, fiction read only for its language; again, for plot; at other times, fiction read only to become acquainted with what writers were doing.

"When he set out to write about the Blue Grass region, he was well prepared," you're told in Lexington.

"He wouldn't accept invitations to run around—he wouldn't go anywhere that the rest of the young folks went. He said he couldn't afford to be distracted, and he said if he accepted one invitation he would have to accept a great many. So he declined them all. He had a few close friends, of course—but he was reserved.

"And he did careful work. I don't believe that there ever was one word that he didn't study about. He was very careful about the shadings and meanings of words. He wouldn't use one word that didn't mean exactly what he wanted it to mean."

In other words, James Lane Allen attended strictly to business. He made little impression in his own country. People there didn't know him—they didn't understand his spirit. And they don't know the human Mr. Allen today. He left Lexington along in the late 1880's, and he doesn't visit the city.

Mr. Allen's birthday is celebrated in the Lexington schools, and the school children of the city are devoted to him. "The Kentucky Warbler" was written with them in view. "My happiness in the story," Mr. Allen says, "was largely dependent upon how my beloved school children in Lexington would receive it."

He added: "It would be impossible for me to give you, the teachers and the school children, any idea of the happiness that has flowed into me from this observance of my birthday. What can I do for you all? I can only hope that I may give back to you all, in work that I may yet do, the impress and the echo of your good and gracious deeds."

Mr. Allen in human form, however, is unknown to these school children!

Perhaps all of this phantomness is to the liking of Mr. Allen. He has often said that present-day writers have been advertised until they are better known than their writings.

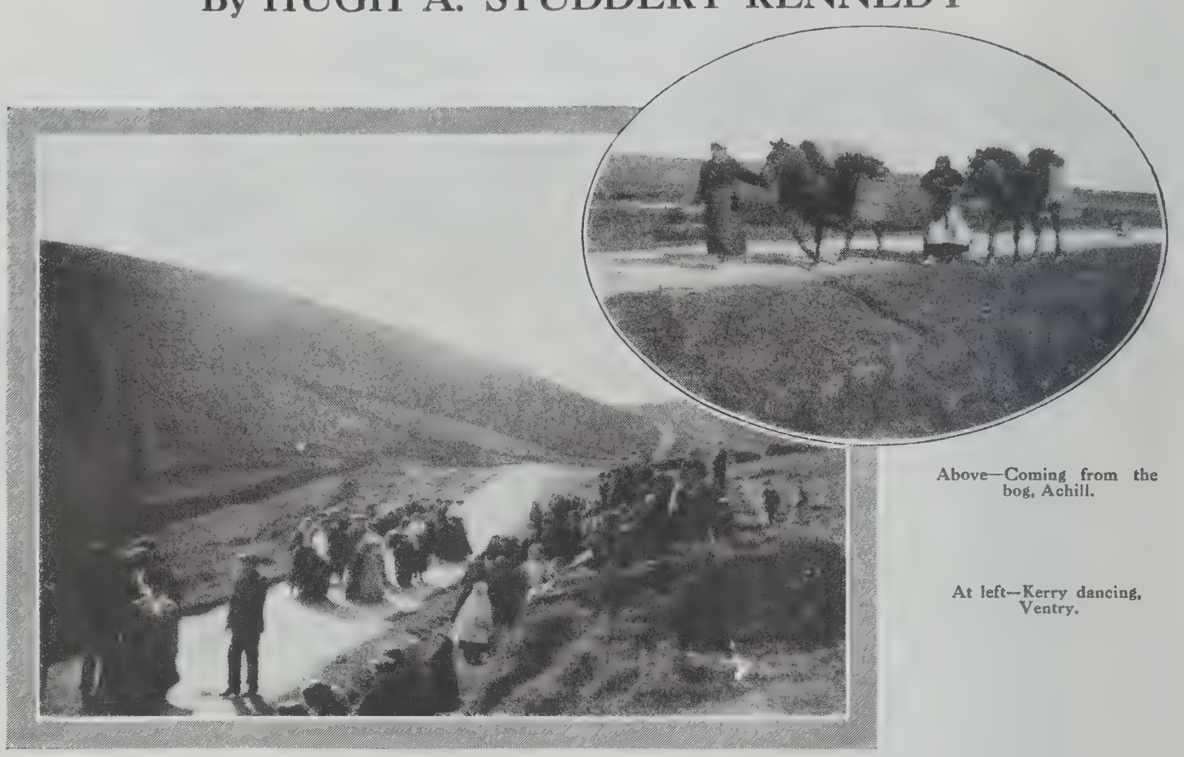
"There has been no commercial annex to my literary life, and sometimes I think I have erred in not advertising," he says.

"When I was beginning to write, a critic and an author were sometimes brought together for lunch by a friend, but I never knew anything like the publicity methods of today."

Out of the Limelight

A Strange Experience for the 'Disthressful Country'

By HUGH A. STUDDERT KENNEDY



Above—Coming from the bog, Achill.

At left—Kerry dancing, Ventry.

A WRITER of considerable reputation sent me, the other day, an article on Ireland—with a bitter complaint. He did not submit the article, he said, with any hope that I would accept it: indeed, he felt quite satisfied that, in point of length, it was too long for our requirements and in point of matter too leisurely. He sent it to me merely because he was puzzled. Every editor to whom he had submitted the article had rejected it, courteously, kindly, but none the less quite definitely, rejected it.

Why?

He was not used to rejections. Was he not a favored contributor to the *Saturday Evening Post?* Had not the *Saturday Evening Post,* time and again, ordered articles from him, and, as is the commendable custom of that journal, paid for them immediately on acceptance? And yet this article of his which, as he recalled, he had described to me, while it was yet in embryo, as a "sure-fire success," had been repeatedly rejected.

Again he asked, Why?

Well, my curiosity was aroused. It was early in the day. I had not as yet even looked the way of the pile of articles in the tray marked *"unread."* I determined, therefore, to read this effort of my friend and try to discover the answer to his insistent questioning. But there was no need for me to read it. The moment I saw the title I knew the reason. I will not reveal the title. The article may yet appear. My friend is a well-known writer. The subject is sufficient. It was an article on Ireland!

My friends tell me I have a "strong journalistic sense," whatever exactly that may be. I suppose I have. Anyway, in this case I seemed to sense the reason for my friend's sorry fortune at once. His article was on Ireland, and the American public, tragic as it is to have to admit it, is tired of Ireland.

Now, let me not be mistaken. The American public is a large-hearted public. It is full of sympathy and kindness, but it knows when it is well off. Its attitude toward Ireland may be summed up in the words, "For heaven's sake, don't start anything!" It was so inexpressibly hopeful when Ireland finally got home rule, and so inexpressibly thankful when the great "rivolution" was finally over, and, with dramatic suddenness, Ireland dropped out of the news.

Some time ago, I wrote something like this to a friend in Ireland—for I have many friends in Ireland, and know and love the country well, from Cape Clear to the Giants' Causeway, and from Achill Head to Dublin Bay—and he replied, not so much in anger as in doubt. He should have thought, he said, that just the reverse was the case. Never before had he received so many letters from friends in America asking for news of Ireland. How was Ireland making out? What of Mr. Cosgrave? What of the senate? What of the boundary commission? What of De Valera and all his host?

Well, that was just it, of course. So decidedly had Ireland dropped out of the news that there was none to be had. And those who felt themselves still bound by ties inseverable to the little island of the sea, must needs write to friends over there and get their news first-hand.

And, well, that is the way with me. Heaven knows I do not want to start anything. Heaven knows I want to let the sleeping dog lie. But I want to know whether they still join hands in the Kerry dance, in the early morning, on the road to the fair "in the town beyant," and whether they still bring home the turf from the bogs of Achill.

Of course, I know they still do. For, indeed, I know Ireland, and have gone through many of her troubles with her; and I know how soon those troubles can vanish like the soft gray mist that comes down from her hills before the rising sun. Laughter is never far away, even when "'tis nothing but trouble sure-ly."

But there is a kind of news about Ireland that the American public, warm of heart and eager to appreciate, will always welcome, and it is the kind of news that is beginning to come through about Ireland. It tells of success, of progress, of a quiet settling down to work; of art and music and drama, driven to cover by the blackness of the black fight, coming out once again into the open. It tells of bridges being rebuilt, of railways being relaid, of "creameries"—oh, sign of settlement indeed!—being restored. It tells of "outside cyars" and "inside cyars," the cars of Saxon speech, taking the road again; of much gossip at the four corners of a market morning; of all the joy of the talk there is to it; in a word, of Ireland rapidly coming to be herself again.

Just the other day, I had a letter from Ireland, and there, in the right-hand top corner of the envelope, were two real Irish stamps. The penny one was a beautiful purple, with a little map of Ireland set like a cameo in the center; the halfpenny one, a wonderful emerald green, with a drawn sword set across a sheet of flame. There is no accounting for feelings, but those two stamps made me feel, more than any other one thing had ever done, that Ireland was indeed coming to be "a nation once again." I am glad she is out of the limelight—for the present.

The Deserted Village

MANY admirers of Oliver Goldsmith have wondered what prototype he had in view when he spoke of "Sweet Auburn," around which is written "The Deserted Village," perhaps the greatest, certainly the best known of his poems. Although critics differ as to the precise spot Goldsmith had in mind when he penned his immortal lines, it is generally conceded that in its composition his mind went back to the scenes of his childhood in the little village of Lishoy, in Ireland, the characteristics of which coincide to a great extent with the Auburn of the poet's imagination.

The village of Lishoy is about seven miles from the town of Athlone. Here may be seen the ruins of the Goldsmith house, of which there stands but the bare walls of the ground story, with a tall, gaunt chimney rearing its head at one end.

Judging from its remains, this house must have been a fairly commodious one for a minister in Ireland at that period. It is approached by a broad avenue of fine old trees, with the green turf like velvet underfoot. Of the scenes which Goldsmith depicts in "The Deserted Village" very few remain. The "busy mill" is still in existence, but has been idle for many years, typical of other industries that have decayed in the Green Isle, but close by is the "glassy brook," the waters of which turned the wheel in the days of prosperity. The building is now roofless, and its site overgrown with weeds. About a mile or so away the "decent church" still surmounts the hill. It was in this building that Oliver as a boy listened to the parson whom he afterward immortalized as the Vicar of Wakefield.

Mr. Ford's Page

IT IS commonly observed that human nature has a tendency to wait upon adversity before it turns seriously to the work of thinking. The reaction from riotous expansion in any field is always a return to rational thinking. It may be a question whether the quality of thought induced by adversity is the best; there are many reasons for believing that it is not; but it seems to be the only way to start any kind of thinking.

The inefficiency of this human habit is very costly. Perhaps this can best be seen by the remedies which have been imposed after periods of economic disillusionment. In the height of what is called "prosperity" (though it may often be a most abnormal overstimulation) the economic world goes thoughtlessly along like the Prodigal who had just received his share of his father's estate. The last moment anyone would expect to give or to hear wise and cautious counsel is during these so-called periods of prosperity. The man would be thought hopelessly pedantic who should stop in the midst of business and ask what it was actually doing to the situation in general.

> *CONSERVATIVES as a class are obstructions to progress, so are radicals: for class conservatives will not improve the economic system, and class radicals cannot. Fighting each other as classes for a material prize, both are anti-social. The management of affairs will continue for some time to come, maybe until the terms "conservative" and "radical" are merged, in the hands of those able to administer them. Broadly speaking, in conservative hands. This imposes a responsibility and a heavy duty on them as social engineers. They must at once forget everything but their social trusteeship and set to work to render the economic machine as little hurtful and as much helpful to all sorts of conditions of men as it is possible to make it. The new conservatism now becomes responsible for progress, for increase of economic justice and stability.*

Our attitude toward economic aspects of life is so unscientific that business in general is like that multitude around the fabled pool whose waters when stirred by an angel had healing power: the only question was to get in while the getting in was good. Stopping to discuss the fluctuations of the water, or to propose plans by which the angelic rippling might be longer sustained, would be counted foolish. It is like that in business. We think of "good times" as haphazard, which now drop down upon humanity, and now fly away. The only question while they are here is how to get out of them all that we can, for there has come a fear, almost a certainty, that however sound "good times" may be, they cannot last.

So that is our first loss: the very best time to study our economic machinery is lost because the majority are so interested in getting the utmost out of the machine that they will give no time to improving it as it runs. The only time we stop and seriously look at our economic machinery is when it breaks down. The very best time to study it is when it is running, as we believe, smoothly and at top-notch efficiency. A bad machine broken down is not much worse than a good machine broken down: the best way to get a line on them is to watch them when they are working at supposedly highest precision.

And that is what we refuse to do. Even our economic observers watch the progress of business mainly to foretell symptoms of breakdown. It is now an established business to keep a lookout for signs of hesitation or collapse so that those who pay for the lookout might run for cover first. But no one pays for, indeed most resent, service that looks toward prevention of breakdown by attention to the system while it is working full speed.

We are losing a great opportunity when we regard business periods as we regard epidemics, which come and go. Medical science chooses to follow a line that makes public health continuous; only the scientific habit of mind can lead us into the desire to make public prosperity continuous.

To that very serious loss is added another, namely, the popular attempts to curb the imperfect economic machine by parliamentary statutes. When the broken machine is partially patched up after a "slump" or a "panic" and is ready for another attempt at producing general prosperity, it suddenly discovers that it will not be permitted to run even as well as it did the last time. Its breakdown has roused so much feeling against it that it has been castigated by laws which hamper it here and there, and make it much less efficient than it was before.

Now what does this mean if not that the public in its political capacity is just as unscientific as is the same public in its commercial capacity? Just as futile. In some distant future our attitudes will seem most grotesque. We penalize a system that doesn't run very well by forbidding it to run as well as it can. To the High Natural Law that made the system break because it was imperfect, we add the human law which decrees that it shall be still more imperfect. The laws in restraint of economic progress have been enacted with a view to curbing the element of human selfishness which is mixed in all gainful activity, but as no laws can do this the net result has been the binding of business in restrictive chains.

It is to be noted that both of these serious losses befall us because of a rooted refusal to consider economic questions when the sun is shining and when everything is going fairly well. When the machinery runs down because of our ignorance of all the natural laws which regulate economic health, there is plenty of discussion then. But the spill has occurred; the break has been made; loss is inevitable; and the longer or shorter period of recovery and repair must be lived through.

These uncalendared seasons of prosperity and adversity grow two types of thinking, the conservative type appearing with prosperity and the radical type with adversity. This is, of course, a broad statement and susceptible of modification, but it will stand for the present. Both these types probably are essential for emphasis, but undeniably neither of them, acting alone, achieves much for progress. The radicals are right in saying that the conservatives make no progress, and the conservatives are probably right in saying that the professional radicals couldn't manage any of the things whose management they criticize.

But this cannot be denied by either: —the responsibility always rests upon those in charge, and they happen to be labeled "conservative," that is, the men whose responsibility for action forbids them to be as irresponsible in speech as some radicals are. But just now, at any rate, and probably for a long period ahead until such distinctions as "conservative" and "radical" cease, the conservatives will be in charge of the economic machinery through sheer right of being able to make it work as well as it does.

With that point of fact agreed upon, what follows? Simply this: it devolves upon the "conservatives" to regard themselves as trustees of power in behalf of all the people. They have been pretty good trustees with regard to themselves. They have introduced certain improvements in the system for the benefit of banks and business men. They have shown their ability to make our crazy-quilt economics yield more square meals and more independence and more homes for more people than has been done anywhere else in the world.

It is clearly up to them now, as trustees, to show what they can do further in the way of making our system fool-proof and malice-proof and greed-proof for the benefit of every last worker in the land. It is a mere matter of social engineering. It may have the effect of reducing "personal fortunes," but it will not have the effect of reducing working capital. What right has a "personal fortune" to be anything but working capital? The time is here, in a special way, when the commanding law is—"to whom much is given, of him shall be much required."

This is not said as a warning that if conservatives would save themselves they must do something. The salvation of conservatism is neither here nor there. No one is more conservative than decent radicals in power with responsibility. There will always be conservatism, just as there will always be seedtime and harvest. No; this is said, rather, because in conservatism is the experience and the ability to improve the economic machinery with a view to making it the producer of universal opportunity and benefit. Such is the original idea of economics, and the original idea of any system can always be developed.

A volume of 452 pages, durably bound, containing 98 of these articles, under the title of "Ford Ideals," will be sent postpaid for $1.00.

Japan's Reaction

OUR Government's reply to the Tokio note has not yet been made public, but time enough has elapsed to show that the Japanese exclusion legislation enacted by Congress has a deeper effect than forbidding Japanese to enter the United States except under certain conditions. It has defined more sharply than even a war could do Japan's status in the world. It has uncovered the real impotency of the Japanese situation.

All the world not long since was voicing propaganda to the effect that Japan was the rising power of the earth. There was a strong movement to rouse in the minds of the people of the United States a fear that Japan would attack and overrun us. The Japanese menace was the boo-man of certain interests.

How different now! By a vote and the signing of a name Japan is relegated to the Orient whence she came. There is grumbling throughout the Island Empire and threats that the American decision never shall be observed. But for all that, Japan can do nothing save submit. A Government has fallen because of the fall in Japanese prestige in America. Bitter humiliation is expressed everywhere throughout Japan. But after all, to what is it chargeable, save to the inability of the touted greatness of Japan to make good? It is Japanese boasts that have failed, not American promises.

An International Disease

A MAN may be an ardent advocate for peace and yet, through force of circumstances, be actively connected with a department that holds itself in readiness for war. This is exemplified in the case of W. Leach, the British Under-Secretary for Air, who, according to the Parliamentary correspondent of the *North Mail*, Newcastle, recently said, in introducing his estimates for the Air Force: "I do not believe in war, and I hope that no more of the splendid young men in my department will be asked to slay or be slain." Mr. Leach, it is said, uttered these words with a quiet simplicity that quite disarmed his critics.

"I hold that the whole business (of war) is a wicked waste of the national substance, but I know that it is forced upon the world by the disease of international fear."

As the *North Mail* puts it, Mr. Leach's attitude may be summed up in the Cromwellian motto, "Trust in the Lord and keep your powder dry."

The motto of the old Volunteer force of Britain is also akin to this: it is "Defense not Defiance."

President Coolidge took the same stand when he said: "We maintain a military force for our defense, but our offensive lies in the justice of our cause."

Within this attitude there is ample room to cultivate those international understandings between equals, which lead to established peace.

Bishop Brown

THE trial of Bishop Brown, of Galion, Ohio, at Cleveland recently, and the verdict against him, prove nothing, except that the least influential of the modern heretics makes a simpler target than those who have New York backing. Bishop Brown does not believe in the episcopal form of church government in the first place, nor does he accept the literal statement of many of the church's doctrines. He expresses a shrewd suspicion that the bishops who comprised the trial court do not accept these doctrines any more literally than he himself does, and he is probably right. The sin does not seem to be refusal to hold the doctrine, but to say so. One may be, it seems, a very acceptable bishop in the sense of being general manager of a diocese, without believing that his consecration as a bishop really makes any difference as to spiritual authority. But publicly to deny that episcopal consecration makes a difference, is another thing.

The general public, which is not so much disturbed over these matters as certain ecclesiastical authorities seem to imagine, is interested in two or three questions:

How long can bishops endure the charge of their equals that they are all intellectually heretical and therefore in like case with those whom they charge and try and cast out?

How long can a church endure the secret and unacknowledged process of sliding from its positive doctrinal foundations to no foundation at all except a hazy sort of organizational good fellowship, without its membership demanding who gave authority for this process to be commenced?

In short, how long can a pretense be made of trying men and keeping in the background the matters concerning which they are tried?

It may confidently be said that had Bishop Brown been more of a scholar, more in accord with the economic views of the ruling powers of his church, there had been more of a fight put up in his defense, if indeed he had ever been permitted to come to trial.

What impresses the outside world is the inconclusiveness of these ecclesiastical events.

Britain's Drink Bill

THE amount spent by Britain in liquor during the year 1923, was $1,537,500,000. This is $2,500,000 more than the interest on the national debt, considerably more than the gross annual assessable value of lands, houses, and other property; almost twice as much as the capital invested in the coal industry; more than twice the amount of taxes collected in 1922-23; nearly three times the estimated expenditure on Imperial defense; nearly four times the amount spent on education; and more than six times the sum spent on the relief of the poor.

Taking the consumption of beer alone, the Englishman's fondness for his beer is amply demonstrated by the fact that the nation drank 30,000,000 more gallons of the product of the brewery than it did of the milk of the cow, while the value of the beer consumed exceeded that of milk by $400,000,000.

These are startling figures, and the total expenditure in liquor represents the sum of $35.50 a head of the population. It has been repeatedly asserted that the solution of much of the economic trouble that afflicts Britain lies in the settlement of the drink question. There appears to be truth in that view.

Mr. Kirkwood, one of the Socialist M. P's for Glasgow, declared in the House of Commons the other day that bad housing conditions was the cause of driving thousands of the population to drink, but, on the other hand, it is contended that to a large extent these conditions are due to excessive fondness for liquor. In its program of domestic politics, the British Labor government has no greater problem to contend with than the liquor question.

Wall Street Wants It

"CONTRARY to the belief of many politicians, of all demagogues and of some newspapers," says the *Wall Street Journal*, "Wall Street would welcome legislation for publicity of campaign contributions on the lines of Senator Borah's proposal. This is because Wall Street has learned a great deal in the past twenty years, having been itself the purchaser of more political gold bricks than any other part of the country. It has come to see that the politician has little to sell and still less in the way of political favor to offer with any guarantee of delivery. Everything that is decent in Wall Street is on the side of publicity . . . . Wall Street is beginning to understand that politicians are not worth buying. . . ."

Maybe it was the politicians who seduced Wall Street in the first place. And certainly there is a rather sizable record to support the general opinion that sufficient deliveries have been made in the past to square the expenditures. The practice was not challenged until the people obtained knowledge of what was going on. But in recent years investigations have quite regularly disclosed the sources of campaign contributions, so that publicity has been had without special legislative enactment. Moreover, the custom which many large firms have followed of contributing to both parties, must have diluted the compulsion to favoritism. So that, when all is said and done, it is plain business common sense for Wall Street to agree to give up a game that is out of date. It was a crude game anyway, and more refined methods have been adopted in its stead.

Congress

CONGRESS has resigned after an exciting session. The biggest piece of work finished to its credit is the Immigration Bill, while its most spectacular work was the investigation of the Teapot Dome and liquor scandals. Although it passed the Soldiers' Bonus Bill, it adjourned without making any provision for the cash. The President's program was frustrated at several points, his recommendations unheeded and his vetoes, with the exception of the last one, overruled. The President's wisdom was therefore compelled to show itself in administrative affairs, leaving the public to judge whether Congress would have been well-advised to accept his counsel in legislative matters. Altogether, the session was a striking example of the power of a "Presidential year" to upset normal judgment and activity. We had supposed that Congress was at Washington to do its proper work, and not to serve as a pre-convention assemblage for the purpose of fighting campaign preliminaries. The political motive, however, was plainly evident on both sides, and it is just as well for the country that adjournment is taken until the Presidential campaign is settled.

Sunday or Monday?

THE powers at Moscow, being of the same breed as those who staged the so-called French Revolution, which was anything but nationally French, are committing the same absurdities. One of the purposes of the French disorders was to dechristianize France, and the same purpose obtains with regard to Russia. Precisely the same methods are used as failed in France. Recent dispatches say that the effort to blot Sunday out of the calendar by making Monday the rest day, has failed, and the proposal is now made to change the calendar, making a ten-day week instead of a seven-day week. All this was attempted in France, and failed.

The speeches made in Moscow are identical with those made in the dishonored churches of Paris when Joachim Ceyrat stood in the pulpit of the Church of St. Sulpice and cried: "Here am I in this pulpit, from which lies have so long been told to the sovereign people, making them believe that there is a God who sees all their actions. If this God exists, let Him thunder, and may one of His thunderbolts crush me!" Then, after a dramatic pause—"He does not thunder, so His existence is a chimera."

Anacharsis Clootz himself might have been in Moscow in 1924 rather than in Paris in 1792, when he took to himself the title of "Personal Enemy of Jesus Christ" and wrote: "Religion is a social disease which cannot be too quickly cured. A religious man is a depraved animal; he resembles those beasts that are only kept to be shorn and roasted for the benefit of merchants and butchers. The People is the Sovereign and God of the world; France is the center of the People-God; only fools can believe in any other God, in a Supreme Being."

It is no wonder that the plain people of Russia have seen in this murderous madness the sign of Antichrist and have regarded the Protocols as the Constitution of Satan. The Prophet Daniel in Babylon had a vision of a power which should come upon the earth in the latter days, whose character he personified and described thus:

> "And he shall speak great words against the Most High, and shall wear out the saints of the Most High, and think to change times and laws."

Why is it that powers able to shake the earth are unable to change the seven-day week?

Four Hundred Per Cent

OWOSSO, a thriving Michigan city, issued, in 1894, bonds to the amount of $20,000, without creating a sinking fund to care for them. The bonds were to be refunded at maturity, which occurs on July 1 of this year.

The town, having paid five per cent interest for thirty years, or 150 per cent of the original loan, finds it necessary to take care of the loan by another bond issue, this time for twenty years at five per cent.

Thus for a loan of $20,000 contracted thirty years ago, Owosso has paid $30,000 in interest, still owes the debt, and now contracts to pay $30,000 more in interest and the principal or $80,000, four times the amount of the original principal.

Under the plan heretofore explained in THE DEARBORN INDEPENDENT, the loan would have been repaid in twenty-five years at a cost of $800 a year, as against an annual interest cost of $1,000 for thirty years which did not reduce the principal a cent, and no refunding would be necessary.

Owosso, when the bonds are finally retired, will have wasted $60,000 because of the delegation to private banks of the right to issue currency.

When Civilization Tottered at Winnipeg

A Big City Without a Government Reverts to Primeval Life

By F. J. CLIFFORD

A WARM spring wind was blowing from the level prairies that stretch endlessly away from the city of Winnipeg, and its two hundred thousand people. It dried and hardened the black roads that mark off the surrounding country into a giant checkerboard. The bright May sun brought relief from the long winter-bound months only recently departed. The big city throbbed with steady pulse and a healthy commerce. Any observer would have viewed it with a glow of approval. But no one, not even the people who dwelt there, would have thought it possible for things to occur that did really occur on May 15, 1919.

There was no indication of impending calamity. The city was typical of any big metropolis on a busy day, all its arteries, nerves and sinews were functioning perfectly. But for all that, a menace was stealing into its very vitals, and as the hands of the clock in the old city hall crossed the hour of eleven, this menace became known in diverse ways.

Street cars unexpectedly left their regular routes and were returned to the barns, or abandoned when near the homes of the crews who were operating them.

Garbage haulers left refuse cans unemptied as they turned their horses homeward.

Grocery clerks laid aside their aprons and stepped swiftly away in spite of the protests of wondering customers.

Postal clerks, some on the eve of pensioned retirement, left their windows and the waiting people there.

Even the policemen, disregarding their sworn duty, abandoned the city to the mercy of human jackals that are always an ever-present menace.

Drivers of milk wagons, drivers of bread wagons, garage mechanics, plumbers, electricians, firemen, grave diggers, and that profession seldom spoken of, handlers of the dead, joined the army of striking workers—for that is what it was, a general strike, a movement boring into the foundation, the well-being of the city.

To get at the reason, the active cause of this wholesale walkout, we must go farther westward, some eight hundred forty miles to the city of Calgary, located where the giant toes of the snow-capped Rockies find their footing on the broad prairies. There, on March 12, 1919, in an obscure building, a meeting was held, a quiet gathering of people made up of Canadians, Scotch, English, Welsh and Russian, a strange mixture of idealistic dreamers, sympathizers and crafty agitators.

Not much is known concerning the minutes of the meeting, just enough to disclose its object; when a resolution was moved by Mr. Cavanaugh, of Vancouver, and seconded by Helen Armstrong, of Winnipeg, to wit:

Be it resolved that this conference place itself on record as being in full accord and sympathy and purpose of the Russian Bolshevik and German Spartacist revolutions.

—Further—

Be it resolved that this conference declare itself in full acceptance of the principles of proletarian dictatorship, as being absolute and efficient for the transformation of capitalistic private property into communal wealth.

After this meeting, rumor had it that a great strike was to be called in Calgary. This persisted for some time; then the location suddenly changed to Winnipeg. There a local strike had been brewing at the Vulcan Iron Works for some time.

About the first of April there appeared among the employes of the iron works a number of strangers. They were full of sympathy and friendly advice, which was given freely to any of the workers who would listen. It was not long till there came the announcement that a mass meeting would be held to vote on the calling of a general strike. A big crowd assembled and the vote was taken. The unemployed being in the majority, and practically all voting in favor of a general walkout, the measure was carried by a safe margin. So a general strike, involving all the employed of Winnipeg, was to take place at the hour of eleven, May 15, 1919, unless the Vulcan Iron Works acceded to the strikers' demands.

A Distressed Citizenry

THE public at large paid little attention to the threatened walkout, some predicting that the owners of the iron works would give in, while others were of the opinion that the strike would never materialize, or if it did, it would die after a few sporadic demonstrations.

So when things began to occur, on the date mentioned, the average citizen looked on it as a kind of joke, hugely interesting. Even when the majority of people had to walk home at the close of the day, it was done with considerable joking at one another's expense (of shoe leather and "Shanks' mare"). But when morning broke and there was no milk for the baby, none for the family breakfast, a bit of seriousness crept into the situation. In spite of it all, they trudged cheerfully to the center of activities. It had turned hot and sultry, a thing quite common in the low, flat country around Winnipeg.

In the down-town section there was not a single newspaper to be had. The ponderous presses of the Winnipeg *Free Press* and other papers were silent. The pressmen had walked out the night before. Instead of terse editorials illuminating the situation, loose rumors were flung about by word of mouth. One had it that Eaton's, a large retail and mail-order store, was to be dynamited that afternoon for announcing that

"Any employe of this establishment joining the strikers will never be taken back."

Though thousands gathered near the place, the contemplated stunt was not pulled off, nor was it done when the threat was repeated many times later.

There was one rumor that the people employed in the upper stories of buildings found quite true. They were told that the strike committee had ordered the water pressure reduced so that the wealthy could have water only in the lower story of their big houses, thereby giving them no more than the poor man in his cottage. One can imagine the trouble this caused to people of tenements and apartments, besides increasing the fire hazard.

During the forenoon sanitary inspectors appeared before the strike to ask permission to go to Weston, a small suburb of Winnipeg, where their help was needed to cope with an epidemic of scarlet fever. They waited the day through, but receiving no answer, proceeded with the work the next morning, in spite of ugly threats by the strikers.

Out at the dairies, thousands of gallons of precious milk was being dumped into the sewer, while numberless sick people and little children suffered greatly through lack of it. Those who had cars drove to the dairies and got what they needed for themselves and friends living close by. They could handle only small amounts, as ice was difficult to procure.

Winnipeg Under the Soviet Rule

IN VICTORIA PARK, a great demonstration was being held. Strikers, drunk with newly acquired power, cavorted about as they congratulated one another. On the speaker's platform stood the Rev. Mr. William Ivens. With hands uplifted, his face alight with the glory of a conqueror, he shouted:

"Winnipeg—is now under—Soviet rule."

It must have been, for the electric lights ceased to burn that night. The streets of the metropolis, including Main, two hundred feet in width, were without a light. People scurried to their homes for the protection of bolted doors and windows.

The big city seemed strangely menacing as darkness enveloped it in shadowy folds. Where some treacherous animal in human form might be lurking, no one could tell.

Another day dawned with the sun blazing hot. Mothers, housekeepers, cooks in general, were at their wit's end in endeavoring to put a palatable meal on the table.

On this day, the seventeenth, the *Free Press* came out with a half sheet, made up by a few of the faithful ones. Across the top appeared the following discouraging headlines:

"City Reverts to Almost Primeval Life as Strike Spreads."

This issue of the *Free Press* displayed a strong undertone of uncertainty, inclining somewhat to an appeal to the autocratic strike committee for relief from the deplorable situation. But that aggregation was becoming equally concerned over the course affairs were taking, especially the food problem. Panic-stricken food hoarders had rushed the grocery shops with the usual result, that some people had more supplies than they needed while others did not have enough. Numbers of people, both rich and poor, had requested the strike committee to establish depots where bread, milk and ice could be had. This question was taken up at great length during their meetings, but nothing of a practicable nature was accomplished. They busied themselves instead with ordering trained men from responsible positions and placing them in the pick-and-shovel brigade. Then some horny-handed son of toil was placed in the position just vacated, with the result of blistered hands at one end of the deal and confused heads at the other.

At this time the telephone employes walked out. Some of their instruments were later found in a damaged condition. Just who was guilty never became known. This walkout, coupled with that of the firemen, caused great apprehension over the fire situation. However, volunteers were found to man the fire halls. Poor fellows, they were much like a young bear whose troubles are all ahead of him. A gang of women in a Red neighborhood rushed one of the halls and cleaned it completely of the new men. Consequently it was locked up by the chief and that particular section left without fire protection.

Reports of fires began to come in with alarming rapidity. Most of them were false. Many others were found to be burning grass, apparently of incendiary origin. At one place the crew had been called for the third time. Arriving at the spot, one of them said to the waiting spectators:

"We have put this fire out completely two different times. It is going to be up to you people to put it out now." With that the firemen drove away. Needless to say, the fire was put out, as there was a healthy chance of having some homes destroyed.

The putting out of the fires, small though they were, was an ornery job. The jeering hoots and howls of people from dooryards and windows were most disconcerting to the inexperienced firemen. Insults were flung their way by policemen, some in uniform. More trouble awaited them on their return to the station, for the engine and ladder trucks had to be backed into place. This was a simple matter for the experienced drivers, but for those who had seldom held a pair of reins, it assumed colossal proportions. The horses, sensing the green driver, often became unmanageable. Add to this an indiscriminate mob of men, women and children, yowling forth their sarcastic comments, punctuated with aged eggs and musty vegetables, and anyone can appreciate the volunteer fire laddies' situation.

May eighteenth was ushered in and found conditions growing steadily worse. Gasoline at the pumps was exhausted. There was plenty at the main supply stations, but each car had to line up and take its turn. Sometimes the line extended for blocks. Before getting to the tanks, each driver was compelled to pay for eight gallons. If his car would hold that amount, all well and good, but if he could only take on, say, four gallons, then he was out the price of the balance.

Many drivers of automobiles were generous in allowing people to ride with them, but it was usually the small cars that carried the full load. The large, expensive ones seldom had more than two or three passengers. None of them could have been blamed if they had refused to carry anyone, for many cases were reported of owners having the back upholstery of their cars cut and slashed by the pedestrians they had befriended with a ride.

Numerous instances were related by drivers who, when requesting pay for hauling some walker into town, were met with the indignant reply:

"You have no right to charge me for riding in this car; it is partly mine. Remember—Winnipeg is under Soviet Rule."

On the nineteenth, the big city was plunged into complete isolation when the telegraph operators quit their instruments. The ticket agents followed suit. This seemed to stir up the wildest of rumors. One was to the effect that the principal cities of Canada were under Bolshevik control, and a bloody revolution was sweeping the United States. A great many of the citizens, other than strikers, believed this. Not only that, but they looked to the strike committee for a way out of the rapidly developing chaos. Many of them went so far as to display "protection" cards, that had been issued them by the committee. It gave the bearer permission to go wherever his duty called him and at any time of the day.

One or two milk wagons appeared with "protection" cards on them which read as follows:

> **"This Vehicle Is Hereby Permitted to Carry Milk to the——————Hospital.**
>
> **By Order of the Strike Committee."**

It is conceded by many residents of Winnipeg that the above acts, taken with the refusal of the International Brotherhood of Railway Trainmen to join the strike, proved its undoing. The local trainmen's union had voted to walk out, but the International Brotherhood denied them the privilege.

Driven to desperation by the last described acts and failure of the strike committee to handle the situation, a number of courageous citizens held a meeting. They organized what became known as "The Committee of a Thousand." It assumed the right to institute reforms in the welfare of the community.

One of their first acts was the establishment of depots in schoolhouses, churches, any place from which they could distribute bread, milk and ice. Supplies were brought to them, heavily guarded by volunteer deputies.

The next thing on the program was the placing of guards at the fire signaling boxes, to stop the sending of so many false alarms. The mail boxes were being constantly meddled with, so over each of them were placed two guards. One would have been sufficient, but the threats and occasional brickbats of strikers or some of their henchmen, especially in the long hours of the lightless nights, was more than the nerves of a single individual could stand. This doubling up caused a heavy drain on the number of citizens who volunteered for the service, so that none was left to answer riot calls. By making intensive drives and the use of all kinds of arguments, a sufficient number of men were induced to sign for military duty when called upon. Great was their surprise when they were immediately rushed to the barracks, hustled into uniforms, a rifle thrust into their hands, and then detailed for guard duty at some beleaguered point.

A Step Toward the Return of Law and Order

THIS action on the part of the Committee of a Thousand had a wholesome effect. Worried people began to breathe easier. The *Free Press* came out on the twenty-second with half a sheet. In it was the following comment:

> "It is quite apparent in a city like Winnipeg, a general strike involving all the activities and utilities—pushed to its logical conclusion—will destroy the community in a brief space of time.
>
> "To make it effective, there would be the inconceivable state of affairs of people condemning themselves to starvation, to thirst, to all the essentials of life. It is impossible to believe that any community of civilized men will thus commit suicide.
>
> "These gentry really dream of taking over the wholesale houses and smaller places of business and doling out food and other necessaries of life to their adherents, thus compelling the rest of the community to get down on their knees for the right to live."

At this juncture, the strike committee gave the waiters permission to resume their duties at specified eating houses; but when so ordered, they were to serve food only to people who could show "protection" or union cards.

The Committee of a Thousand warned all the people to stay off the streets after nightfall. If anyone did

(Concluded on page 14)

Superlatives in the Field of American Sports

When Can a Star Be Called Best; What Qualities Must He Have?

By PAUL MACDONALD

AMERICANS have a weakness for superlatives. A foreign critic once called this the land of the "est." With us, he said, it would never do to call anything fine for it had always to be the finest. Nor did we refer to anyone as simply great but always as the greatest. Nothing was apparently simply big but always the biggest. No occasion could be grand; it must be the grandest.

No subject is free from the superlative adjective in discussion but some subjects produce more superlatives than others. One of them is sport. Now, nearly everyone is interested in some form of sport or other. We all have our idols in sport whether these idols are baseball players, football players, track leaders, tennis, golf, boxing champions or oarsmen. And we like to extol their athletic abilities. To emphasize properly their greatness we resort to superlatives. It seems to be one of our national faults.

So many superlatives have been used in describing games and individual participants that we were prompted to review the list of popular sports, their leaders and leading contenders and their principal performances and try to discover a perfect performer or a perfect play.

Baseball generally gives Tyrus Raymond Cobb credit for being the greatest player of all time. Some prefer Honus Wagner for this honor. In a voting contest Cobb would undoubtedly win.

Judging ball players purely on records, Cobb is the supreme player of all time. In batting there are five men whose records stand above the field. They are Cobb, Wagner, Adrian C. Anson, Napoleon Lajoie and Sam Crawford. Cobb's record is the best by a comfortable margin and not another man is close to his lifetime batting average of better than .370. In the matter of base-running he is the best of all time and his record backs up the assertion.

Baseball's Best Players

COBB revolutionized baseball more than fifteen years ago. He introduced so many new ideas that others, following his example in fielding, batting and running bases, changed the entire style of attack in baseball and the defense had to change to meet the new ideas and to overcome the advantages that the Cobb methods created.

Never was there the equal of Cobb as a base-runner, nor did he ever have an equal as a scientific batsman, but several men in baseball were better natural hitters than Cobb and far harder hitters. Cobb got comparatively little distance to his drives. He would not hit a ball as far as Crawford, one of the great sluggers of baseball and Cobb's teammate while Cobb was climbing to glory. Nor could he hit as hard as Anson, or Lajoie, or Wagner, or Ruth, or Heilmann, or Hornsby, the last three the leading sluggers of this day in baseball. They are all harder hitters than Cobb ever was.

Cobb's weakness came in fielding. He was an excellent fielder, one of the best in the game, but compared to his batting and base-running his fielding was weak. He never could equal the fielding of Tris Speaker, his American League rival. Speaker was nearer perfect than any outfielder of the last fifteen years, although he could not hit with Cobb nor was he in Cobb's class as a base-runner. The weakest part of Cobb's fielding was his throwing. During the spectacular seasons of his career he was always handicapped by a weak throwing arm.

Wagner was a better fielder than Cobb and an all-round fielder. Wagner could play any position. He started in the outfield and later transferred his activities to the infield. Nobody ever compared with him as a shortstop. He was best known at that position. He was broad, deep and powerful, a remarkable physique. He was extremely bow-legged but he could cover a great deal of territory and reach balls that would get by any other infielder. Wagner smothered a baseball in fielding. When he grabbed it Wagner apparently wanted to crush it, or tried to. It looked that way. He was one of the best batsmen of all time, although not so good as Cobb. He was one of the best base-runners of all time and here, too, he was not so good as Cobb. Physically Wagner was a better fielder than Cobb, physically and mechanically. But here is where Cobb outclassed Wagner, as well as all players before him: He carried the keenest mentality the game has known. He was the quickest thinker of all time. He was not the fastest man in baseball, although he was as fast as any, but he did have perfect co-ordination. His mind worked in perfect harmony with the limbs. His body responded on the instant to the command of the brain. He caught his full stride with the second step. No batsman ever broke from the plate as quickly as Cobb, none ever started as quickly. He was generally two plays ahead of his opponents and ahead of his own teammates as well. Wagner lacked this mentality. Wagner lacked the temperament of Cobb, the imagination, the inspiration, the trigger-like action. No player ever rose as high above the mechanical as Cobb, and Wagner was mechanically near-perfect although he lacked grace. He always appeared awkward although he covered more ground than any man in the game.

For grace, no infielder ever compared with Lajoie. He was a great fielder and a wonderful batsman. Lajoie made every chance look easy, no matter how difficult. He was form personified. He fielded as Willie Hoppe plays billiards. But still, Lajoie was never more than an average base-runner and he lacked the competitive spirit that was so pronounced and predominating in Cobb. Wagner, too, lacked this spirit. You liked to watch Lajoie for the same reason that you like to watch any perfect piece of mechanism but his play never inspired or thrilled you as Cobb's. There was nothing magnetic about either Wagner or Lajoie and there was about Cobb.

George Sisler, had he been saved from the calamity which interrupted his career, might have equaled Cobb's record in batting, but Sisler was the only player since the day of Cobb who gave such promise. Like Cobb, he was a scientific batsman, but he could never compare with Cobb as a base-runner. His fielding was good but he did not play the best first base of all time. In fact, when Sisler reached his top form there were a few first basemen probably as good in fielding as Sisler.

Frank Frisch, of the New York Nationals, is probably the best player today. Frisch is a great fielder and while not the best batsman in his league is still one of the very best. He is a good base-runner, although not so good as Cobb, and he lacks the keen mentality that Cobb had. Frisch is still a young player and he may improve over his present form. He is the only major league player today who slides hands first.

Among the pitchers, and pitchers always deserve a separate classification, there is one that came near being a perfect pitcher and that is Christy Mathewson. He had everything a pitcher needs but he also made mistakes and perfection does not make allowances for mistakes. But there has never been another pitcher as good as Mathewson and there does not promise to develop one as good in the near future. Mathewson was a complete pitcher. Grover Cleveland Alexander, one of the leading pitchers of modern baseball history, used a curve and fast ball and control to gain his place near the top. He never had the assortment nor variety that was Mathewson's. Ed. Walsh, one of the leading pitchers in the American League, depended chiefly upon a spit ball and control while Walter Johnson, one of the great pitchers of all time, depended solely upon a fast ball and control. Analyze all the winning pitchers of all time and none will be found who equaled Mathewson either in amount of pitching stuff or ability to use it at the right time.

So there you have the leading players in baseball. The game produced many other stars but we have mentioned the men considered at the head of the profession and, as you observed, none of them is without flaw. Not one of them is perfectly balanced. In all there is some angle of play that could have been improved.

You often read in the newspapers where a pitcher pitched "a perfect game." This refers to a no-hit game. But a perfect game has never been pitched and probably never will be. To pitch a perfect game a pitcher would have to retire twenty-seven batsmen in succession, each on three strikes and pitch no more than seventy-one balls. In other words, he would have to pitch nothing but strikes for nine innings. Only that can be a perfect game in the full sense of the word and it has never been done.

A year or so ago one of the leading sporting publications set out to discover the name of the greatest football player of all time. This has long been a subject of argument. It had never been definitely decided just who was the best player ever produced on the gridiron, although more than a score of football leaders had been designated as the greatest of all time. The publication in question wrote letters to all the leading college coaches, to the leading officials, to players and to other men closely identified with the game.

The answers varied. A score of players were named. William (Willie) Heston, who used to play halfback for the University of Michigan, led in the votes. A close second to Heston was Hinkey, known as "The Shadowy End" when he played one of the wing positions for Yale. Close behind them in the voting came Jim Thorpe, the Sac and Fox Indian, who played in the backfield of the famous Carlisle Indian School team.

Months were required to collect the votes and when they were gathered the answer to the question: "Who was football's greatest player?" was as far removed as ever.

What Constitutes "Best" in Football

FOOTBALL has produced many splendid players. Each season finds between thirty and fifty men who rise above their fellows, whose names are frequently printed in the newspapers and who are recognized stars. We read that this or that player is the greatest ever produced, in fact, any football season finds a dozen or more players who are called the greatest.

There have been many good football players and a few great ones but no one knows, as has been proved, who really was the greatest. Football teams rarely play more than eight games each year and even when a man plays a full schedule it is impossible to get a definite line on his ability, in comparison to others. No player engages in more than four or five big games, that is, games that are considered big ones by his team. The number is generally under five, rarely more than three. So the average player is tested in three games in one year and that is not enough properly to place him in the ranking lists.

A famous baseball manager once told us that football could never compare with baseball because it lacked batting, pitching and fielding averages, rather the equivalent of these averages. The record books make baseball the popular game that it is, according to this manager. They give people an opportunity to gauge the ability of a player and compare him. Football, offering no such sound basis for comparison, can never touch baseball's popularity for the value of a football player remains but a matter of opinion and this is mostly hazy. There is nothing definite about football, nothing clear about comparative values.

According to the vote referred to, William Heston, of Michigan, is regarded by most of the leading experts as the best football player of all time. But, the coaches of today and the students of the modern game will assail this opinion with some sound arguments. Heston made his reputation more than twenty years ago, in the days of mass formation and the smashing attack against the line. Heston was of remarkable physique, "built for the game of his day." He had weight, power, and he was one of the fastest men playing football. He was, without doubt, the best back of his time. No man ever started faster nor has any player ever hit a line harder or turned more quickly into an opening. Heston, playing football today, would probably be the best line smasher in the game, but (and here the disciples of the modern school of football would score their points) what could Heston do in the kicking game, in throwing forward passes or in receiving passes?

Football teams rarely kicked when Heston played. The kick was not the important part of the game that it is today. Now, the kick is the most important thing in football but in those days it was line smashing and Heston could do that. It is open play today and the most valuable man in the backfield is the chap who can kick, pass and run. The player with this three-ply talent is referred to as a "triple-threat" man. This means that with the player in punt formation he has the defensive team fairly at his mercy for he is certain to do one of three things, but which one? He may kick, forward pass or run. The defense has to be distributed to take care of one of three methods of advancing the ball which means that the defense will not be concentrated for any of the three things which the player in punt formation will do, providing the ball is passed to him. Often it is not passed to him, which does not reduce his value, for the defense will be spread to take care of his threat and this will enable one of the other backs to take the passed ball and find the defense less effective.

Today's Requirements

SO, TO be of the best value to his team, the back must be able to run, kick and pass. Heston could run but if he could neither kick nor pass, and there is no reason to believe that he could do either of these, he would not fit into the modern style of play as well as a number of backs of recent years who lack the high reputation that Heston carries. It is impossible to say that Heston is the greatest of all time. The nearest statement to anything definite would be to call Heston the best back of his time. To bring him into the modern game would leave many questions unanswered. Some of them we have cited and others would relate to blocking, which was not the developed art in Heston's time that it is today. Also, interference, tackling and guarding against forward passes in the secondary defense zone.

Thorpe was also the best back of his time. Thorpe fitted into the modern game. Thorpe could kick. We saw Thorpe play one game on a field covered with thick mud. Standing twelve yards back of center, which is quite a distance back for a punter, Thorpe called for the ball. The pass was high. Thorpe reached up with one hand, picked the ball out of the air and threw it down. He did not drop it as punters do, but threw it. His foot connected and as the ball started on its flight a thick coating of mud was scattered through the air. The ball landed forty-five yards from the scrimmage line, traveling a total distance of fifty-seven yards.

The noted Indian could forward pass and receive passes. He could go through a line or around the end. He went off tackle. He hit hard. He was a splendid broken field runner, elusive and fast but also powerful.

With all his speed Thorpe was never the equal of Heston in going through thick defenses. Thorpe needed several steps before he hit the line of scrimmage and he usually took a position much farther back than the average player. He needed the extra steps to gather speed so that he would reach full momentum when he hit the line. Heston was at top speed with the second step and he stood close to the line.

If Heston played today and could neither pass nor punt, the defensive team would not have a difficult problem. They would concentrate the defense on Heston whenever it would be evident that he would take the ball. Heston would probably be the best line smasher in the game today but that would still leave much to be desired in him. Thorpe could hit a line and kick and pass besides and do remarkably well but Thorpe also left some things to be desired. Thorpe's defensive play was not of the same excellence as his offensive work and Thorpe lacked the fighting temperament. He was indifferent. Only at times would Thorpe rise to his full ability. The lust of battle was lacking in him. He did not have the competitive spirit of Heston. Thorpe had courage and stamina and many other qualities but a few of the most desirable were missing.

Hinkey was undoubtedly a great end. The most remarkable thing about Hinkey was that he played in the day when weight was paramount. He was a star in the days of beef and power and he never weighed as much as 150 pounds while he played for Yale.

Probably, if he played today, Hinkey would be just as fine an end as he was in those days at Yale, but this is questionable, for the end play has seen some astounding changes and an end today must do many times as many things as an end did in Hinkey's time. The outstanding ends of recent years have been big, rangy, powerful and fast men. Muller, of California, Hanny, of Indiana, Kirk, of Michigan, Tebell, of Wisconsin, and others, were all big men. One of their duties was to catch forward passes and size and weight is of immense value in this angle of end play. Hinkey never dreamed

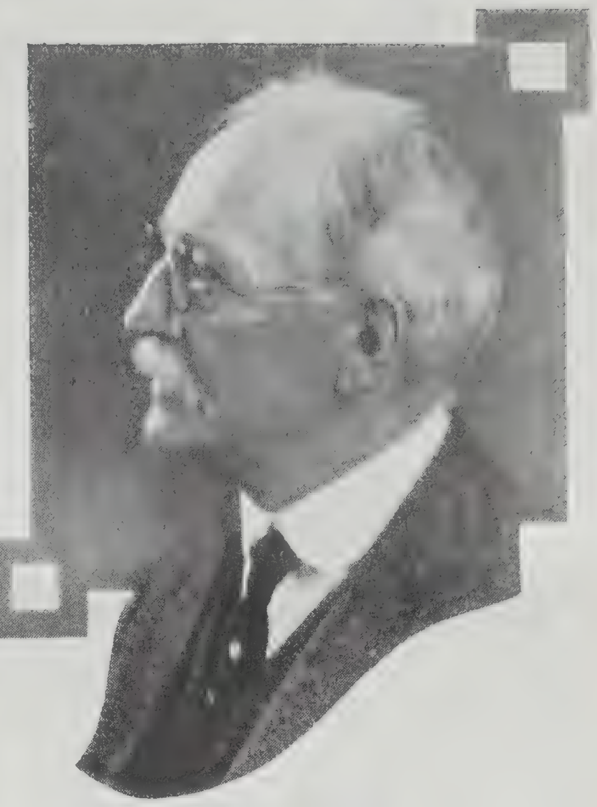
His Father's Son, and Worthy of the Name

The Mastery of Reproducing Nature on Canvas and the Art of Saying Beautiful Things in Pigment Have Been Handed Down Like Precious Legacies in the Inness Family

By GEORGE H. DACY



GEORGE INNESS, Junior, N. A.

DESPITE that he is more than seventy years old. George Inness, Junior, N. A., pays no attention whatsoever to union hours as he reproduces the beauties of nature on canvas and creates landscapes which rank among the best ever exhibited in America.

Every morning, except Sunday, by nine o'clock. you will find Mr. Inness at his easel where he paints brilliantly and industriously until six that evening with a half hour off at noon for lunch. After dinner in the evening, Mr. Inness returns to his studio where for hours at a time, he sits smoking before his paintings, studying the themes. the lights, the shadings and color blends of his pictures; planning on the improvements he will make on the morrow; searching for any flaws or defects which may mar the completed effect of the landscapes.

The laity have long been contented to visualize the successful artist as a person who works inspired under the spell of muse—a man of great talent whose hands, as they produce marvelous scenes in oils and watercolors or pastels, are regulated by some unfathomable power called genius. All of which, according to Mr. Inness who has climbed far up the ladder of artistic achievement. is pure buncombe as he claims that hard work is the one and only recipe by which to forge ahead in the field of landscape painting. Mr. Inness works a dozen hours a day six days in the week and when he is resting on Sunday, he is unconsciously thinking about the unfinished canvases in his studio.

The Mission of the Painter

"THERE is nothing to this inspired art. A successful artist must have a pronounced tendency toward art and must have his ability developed. After that all that is necessary is constant toil and grind and incessant attention to duty.

"Let us believe in art, not as something to gratify curiosity or suit commercial ends, but something to be loved and cherished because it is the handmaid of the spiritual life of this age."

George Inness, Junior, whose father ranked as America's greatest landscape painter, has been painting professionally for fifty-five years and abiding rigidly by his hard-work schedule. His ideal of an original style in art is tersely expressed best in his own words: "I will put the pigment on canvas as a suggestion of the effect I desire to attain and leave it to your mind to form the completed picture."

The Inness, Junior, landscapes with their marvelous green colorings, their matchless cloud effects and remarkable tones of light are but suggestions. The longer you look upon them, the better you like them and the more of the pictures you visualize. Mr. Inness says that art in its purest form is merely the suggestion that awakens the spiritual impulses of men and quickens their emotions. George Inness never paints from nature. His only models are the fancies of his subconscious mind.

"If I, with my painting. can accomplish what a musician possessed of feeling and expression can do with his instrument. then I am an artist," said Mr. Inness. "Merely to play a piano does not indicate that the performer is a musician. He may be skilled in technique, he may execute with accuracy all the notes of the composition, but unless he awakens in the mind of the auditor some feeling of exaltation and spiritual emotion, he is merely a piano player and not an artist. What I have tried to do with my painting is to lift the minds of men to higher things, to give them better thoughts. to encourage them to go out into the fields and woods and study nature in her varying moods—if I can give them a new vision of life through my use of canvas and pigments, I am satisfied.

"If I have any skill," continued Mr. Inness, "and if I have disguised that skill so that the artist is forgotten in the contemplation of the painting, and if it arouses the emotions instead of recalling thought of me to the spectator, I have succeeded in doing what I have worked so hard to perfect in my pictures. A modern landscape artist must be a consummate craftsman. He must paint in such a manner that his craftsmanship is entirely disguised and the suggestion in his picture is emphasized as the important feature."

An Inherited Talent

THE Inness pictures adhere to truth in art yet they refuse to acknowledge any allegiance to hidebound conventions. The mode of the pictures is George Inness' personal conception. They are not at all like the works of modernists. They do not have to be studied diligently to be understood. They teem with suggestion and convey their own inspiration. The picture may be nothing more than a bit of woodland, trees and a trickling brook backed up by a glorious morning sun. Another may be a hillside swept by a crisp wind, with the sunlight dimmed by scuddering clouds. The pictures are not photographic—Mr. Inness scoffs at the idea that an expert artist is anything like a camera—but they thrill the spectator with inspiration and appeal to his better emotions.

A fundamental law of heredity is: "Like begets like." Mayhap, George Inness, Junior, his father's son, owes some of his sterling ability to the operation of this mandate of being which is as old as man. On the other hand, however, the success of the son is outstanding insomuch as many of the sons of famous fathers have not even approximated the duplication of their sire's achievements. The remarkable record of George Inness, Junior, is unique in the world of international art for he is one son endowed with the master-art of his father who has capitalized his opportunities to the maximum.

George Inness, Senior, was the fifth of a family of thirteen children. When fourteen years old, he left school and worked as a clerk in his father's grocery. Young Inness' bent for drawing soon developed so strongly, to the neglect of his duties as a grocer's apprentice, that he was allowed to study pencil drawing under an old instructor. Despite delicate health, he slowly mastered the engraver's art and subsequently learned about the rudiments of landscape painting. Hard work and constant application to painting were the slogans which he followed. Ultimately, he developed into one of the greatest landscape painters America has produced.

His work is notable for its subtle charm and great delicacy of color. "All his pictures are tone-symphonies, broadly painted, deeply harmonized and in perfect concord. The history of art holds Inness in honor as one of the most delicate and versatile landscape artists of the New World."

One art critic has appropriately described the devotion of son for father—the love of George Inness, Junior, for his famous forebear, in these words: "This reverential attitude toward George Inness. the artist-father. by George Inness, the artist-son, is one of the most impressive characteristics of the latter. Having once heard him speak of his father and his father's work, we ever after associate the two in thought.

"In this expression of veneration of son for father. and of admiration of artist for artist, and the untiring perseverance in following his father's methods and instruction, we find the reason for the greatness of George Inness, Junior. Through his infinite faith in the creed of his father—that one must seek with reverent approach the secrets of creation in the workshop of the Creator—and his never-deviating pursuit of the trails blazed by that father, he is perpetuating and supplementing the work of one of this country's greatest out-of-door artists.

A Remarkable Triptych

"SCHOOLS have come and gone: method has succeeded method; artists have appeared and disappeared, but Inness has unswervingly followed Inness in his efforts to paint the truth as it has been revealed to him by nature, at whose shrine he has worshiped. Nature from whom he has learned to produce the marvelous effects of light, atmosphere and color which are his rich contributions to American art. These effects are due not to the technic of text but to the technic of touch; not due to paint but to the absence of paint; not due to color but to the suggestion of color. The effects which make all his creations not a familiar scene made up of familiar objects, but a remembered environment; an environment not of place but of feeling. We are not looking upon a tree, a stream, a valley or a hillside; we are feeling the great outdoors; we are tensed by the gathering of storm clouds, we feel the freshness of the shower that has passed, we are enveloped by the afterglow of the sun that has set. This is Inness—not Inness the son, but Inness the father and son."

Latterly, Innes the son presented a remarkable triptych to a little church at Tarpon Springs, Florida, where he has his winter home and near where his father before him lived for many years at Camp Comfort, his beautiful lodge on the tropical Ancloute River. The triptych done in three panels is based on the beautiful imagery of the twenty-third psalm and is something entirely new and different in church decoration. Art critics from all parts of the country have made the long trip to Florida's western coast to view and study the masterpiece.

"And beside still waters, he leadeth me, in green pastures." Visualize, if you can, what these words mean and you will have some slight idea of the three panels which Mr. Inness has painted. The pictures showing wonderful blends of color and sky and cloud effects are rich in suggestion and show a shepherd leading his flock out of the darkness and into the light. Critics estimate that this trio of pictures is worth at least $75,000, yet Mr. Inness gave them to the little village church.

Foreign Training Unnecessary

IN THE rear of the church are three other panels depictive of the promise of the rainbow, the realization of light, the crops that resulted from the favorable season and the bounty of the Lord. It is a strange story that these gift pictures tell. Some years ago, the tiny church that stood originally on the site burned to the ground.

A wealthy resident gave money to build a new church but instead of employing an architect, she hired a plumber to plan the new edifice. Deeming windows as the most important equipment in a church, the plumber provided three large windows in the front, three others in the rear and a half-dozen on the exposed side of the structure.

The result was that the glare was so intense that the pastor, when preaching, could not see his parishioners while the churchgoers could not see the minister. A severe windstorm came along and blew the windows into smithereens. The church funds were exhausted. Mrs. Inness then volunteered to get her husband to paint appropriate panels to replace the windows. That is the "how come" of the triptych—and the trio of panels in the rear of the church at Tarpon Springs—paintings which are worth twenty times as much as the edifice which protects them.

Mr. Inness believes that a great artist can be trained and educated in America, at present, without any need for foreign study. He says that art is in decadence abroad; that the over-sea countries have produced no really famous artists during the last half century; that they are living on venerable but tottering reputations. He advises young artists to master their drawing before they begin to paint. "Too many teachers at present slight drawing in order to push their pupils ahead in the actual work of dabbling with pigments. It is entirely wrong. To climb a ladder you must start at the bottom, not at the top. To acquire skill in painting, the amateur must first of all develop adeptness with the drawing pencil."

The Critic and the Fly

GEORGE INNESS, Junior, overflows with dry humor which makes a visit to his delightful tropical home a joy to the transient scribe. One of the best of several stories which he tells fluently is the following: "It was during an art exhibition where all the great landscape painters of the world had pictures on display. An art critic was describing at length the merits and defects of the different pictures. When he came to mine he said, 'As you see, all these other pictures are very fine but here is one that is different. The trees do not look as though they will stand up; the grass does not appear to have roots; the clouds are mere splotches of color, and, trying to make it realistic, the artist has even undertaken to paint a fly onto the landscape. It is really but a daub which looks stiff and unnatural.' And about that time, the fly becoming tired of such chatter, flew away."

The Wages of Million Go to Pay Bond Buyers

Cities and States in Frenzy of Borrowing

THE market for state and municipal bonds in America has been going strong for the last eleven years. During the same period conditions have been growing harder for the small taxpayer; his rate is up and he sees a larger per cent of his tax dollar go into the pockets of the coupon clipper.

Interest on the aggregate of these bonds in the year 1923 would have paid the cost of a highway, paved with brick or asphalt with a nine-inch concrete foundation, from New York City to San Francisco, over the northern route, and from San Francisco through California and east to Palm Beach, Florida, on the southern route, at a price of $35,000 a mile. In addition, the surplus could have been made available for industrial uses and the income used to pay the wages of a thousand men to keep the roads in repair.

The total of state and municipal bonds issued from 1913 to 1923 inclusive is $7,804.378.855.

Causes for the unprecedented bond issues in every state and nearly every city may be many—civic pride, duty to the soldiers, public necessity, and so forth, but underneath the desire of cities to be a step in advance of progress was the propaganda of those privately benefited. The decade just ending has been a field day for tax spenders and tax evaders—that patriotic class of citizenship which demands public improvements at the other fellow's expense.

In 1922, the aggregate of bonds issued by cities and states exceeded by $225,000.000 the total Federal debt before the war. In 1921, when the frenzy reached its zenith, the issues exceeded this government debt by $355,000,000. To give an idea of the increase from year to year for the period covered, the following figures are cited:

1913	$ 408,477,702
1914	445,905,610
1915	492,590,141
1916	497,403,751
1917	444,932,848
1918	262,818,844
1919	770,195,248
1920	733,663,986
1921	1,383,368,900
1922	1,253,862,437
1923	1,111,159,388

During the war years of 1917 and 1918 the issues were greatly reduced because of the rule that only work necessary to the prosecution of the war should be done and no other public improvements attempted unless of an emergency nature. But immediately following the Armistice and the lifting of Federal restrictions, lost time was rapidly made up.

The states' debts total more than $1,125,000,000 of which almost $600,000,000 has been created since 1917.

What was the money used for? The largest percentage, of course, has gone toward the construction of good roads. The demand of the public, especially that part of it owning automobiles, has been for more and better roads, preferably paved highways. The states have been in competition, due to some extent to the proposal of the Federal Government to match dollar for dollar up to a certain amount in promoting great highway projects. The expenditures of the states for these roads is more than $400,000,000.

How Debts Are Incurred

IT IS a question whether a wise policy has been pursued. There is no such thing as a permanent road; highways costing from $20.000 to $60,000 a mile have been laid where intelligent investigation would have shown them unnecessary. A road properly drained and rolled would answer the purpose in at least half of the cases and the cost would have ranged from a few hundred dollars to $4,000 a mile, depending on the locality. Traffic on a great majority of the roads does not warrant $35,000-a-mile paving.

Upkeep of a paved road is one of the permanent items in a state budget. The amount is not small and the taxpayers either directly or indirectly are being called upon for ever-increasing sums.

About ten years ago, when the paved road craze first hit one of the Southern Ohio counties, a small stretch of one of the main traffic highways was improved. The upkeep cost has totaled $55,000 a mile and the public, while repairs were being made, has been deprived of the use of large sections of it at intervals.

Roads paved three and four years ago are crumbling in many cases. In other instances they hold up fairly well.

There is no argument against paved roads for heavy traffic, but a careful investigation would show them unnecessary in hundreds of cases.

It is a practice in many states to issue bonds to pay for roads—bonds maturing in from twenty to fifty years. Long before the first bond comes due, the road improved needs repairs; and interest charges must be met. Before the debt is paid, the road has been rebuilt.

Take a most conservative example: A stretch of road six miles long is to be paved for $200.000. Bonds for twenty years at four per cent are issued, the first batch of $20,000 maturing in ten years. By the time the bonds are paid the road will have cost $316,000. But if there is any part of the original work left at the end of twenty years, it will be surprising. The chances are, judging from some present-day roads, that the upkeep will be close to half a million dollars in addition.

Ohio's road maintenance bill exceeds $5,000,000 a year.

After the war many states, in fact all of them, were eager to show their appreciation of the boys who took the great chance. Many of them acted on the impulse and voted a bonus. The states' debt, due to the bonus, is $207,000,000.

Lack of a plan of amortization was the cause of $118,000,000 of the liability in 1922. Officials evidently have found more pleasure in spending money than in paying debts. The easiest way for a debt to be paid is to issue bonds to pay it. Why should they worry? Let their successors do that.

Less than $17,000,000 of the outstanding bonds represents investments in educational institutions.

In South Dakota, the per capita debt exceeds seventy-four dollars, but the bonds have been issued to advance funds to farmers.

A Scramble to Spend Money

MICHIGAN had no state debt in 1917; in 1922 bonds issued totaled $61,550,000 with $83,500,000 authorized. Road bonds totaled $28,050,000 and the soldier bonus $30,000,000. These figures, however, do not represent the real costs. When the soldiers' bonus, for example, is finally paid, it will have cost Michigan $87,000,000—that is, $30,000,000 for the soldiers, $57,000,000 for the bond buyers.

In Ohio it was necessary to amend the constitution to bond the state for $25,000,000 to pay a bonus, for the charter of 1913 forbids a state debt.

New York, Massachusetts, California and Pennsylvania are responsible for nearly half the debt of all the states. Kentucky, Nebraska, Kansas and Wisconsin are blessed—they have no state debt.

"The spirit of the times" may be actuated by a very clever propaganda of those who seek a market for idle money and tax-exempt securities. And the spirit of the cities in the last decade has been one of keen rivalry and almost wanton extravagance.

More than eighty years ago it was common practice for cities to bond themselves and turn the money over to private corporations in development schemes, such as building canals, roads, boats, railroads. The situation became such, the debts so heavy, that many of them were repudiated. There is not a city in America today, however, that will repudiate a debt.

Cities in other states should study the situation in Ohio. There the crisis has been reached with half of every tax dollar going into the sinking fund. Municipalities are on short rations. School boards have been forced to reduce the length of the term. Firemen and police have been laid off. Special taxes have been levied by officials when voters refused to sanction increases at the polls. Improvements in many towns have been abandoned. Street lighting in one city was assessed against the individuals. Another city has been forced to increase its water and gas rates.

The municipal bond has proved a gold brick for the taxpayer and a gold mine for the bond buyer.

The lamented President Harding sounded a warning of the debt situation in his last message to Congress in these words:

"In the efforts which have been directed to reducing public expenditures I have been much concerned in the apparent state, county and municipal indebtedness, and I am fearful lest this condition may be in part attributable to the expenditures made by the government pursuant to its Federal aid laws, as many of these laws require state contributions as a requisite to the extension of Federal aid."

The greatest monument to him would be to heed this warning, but it is apparent that his advice, insofar as municipal borrowing was concerned, was not popular. Cities and states continued during 1923 their mad scramble to spend money but not with the same impetuosity exhibited in 1922. The total issues for the year just ended are $142,703,049 less than in the year preceding.

Federal statistics recently issued show that the total revenues of all the states, cities, townships, schools, and other subdivisions for 1922, together with revenues for the national government for 1923 totaled $7.433,081.000 or an average of $68.37 a person. The interest bill was almost a fourth of the total or a little more than sixteen dollars for every person in the forty-eight states and the District of Columbia.

Here is something to think over:

The interest for 1923 on the Federal debt was $1,100.000,000.

The interest for the same period on state and municipal bonds, most of which were issued in the last eleven years, was at least $500,000,000.

In other words it required the wages of a million men at thirty dollars a week for a year to meet the interest bill of 1923.

The Ricsha Man of China

Concluded from page 3

man and you prod your coolie in his direction. Many times he speaks some English, this handsome Indian who is a British subject, but sometimes he does not, and if it so happens that he does not, then you get into a panic, especially if the dusk is coming on apace, and you conjure up visions of being dragged to some opium joint, a la movie, or of being held for ransom and being written up in the China *Press*. You wonder what they will say back home, and if you will live through it all. But in the offing you see a ricsha with a man in it who looks like an Englishman, and is one, and your troubles are ended, for he knows his Shanghai. He directs your coolie to follow him, and lo and behold, in a surprisingly short time you are out of the maze of little crooked streets and onto broad Avenue Joffre, and shortly are delivered at your own door before any one there has thought to wonder why you are so late.

The most maddening part of it all is that your coolie will hold out his hand for more pay, when you have paid him a-plenty, and that he will blame you for the long trip when he himself alone is to blame for making it so long. But you pay him!

I had been in Shanghai four days and had not yet learned the way of the land, or the way of the ricsha coolie, and that night at midnight I was leaving for Wuhu on the *Poyang*. Wuhu is an outport in the interior, up the Yangtze River. The dock was a short half-mile from the hotel and all the heavy baggage had been sent down early in the evening. There were four of us to take the boat together, but because of a temporary jam at the hotel door as we passed through, the other three got away before my coolie, and we were separated. I never knew what, if any, difficulty the others had in making the boat, but I never shall forget my own. It was raining. There was the usual confusion at the dock, and I peered out from behind the black curtain to see what it was all about, only to find that my coolie had pulled the ricsha up alongside the *Kwanglee*, bound for Hongkong. My traveling bag was being wrestled from the tight grip in which I held it, and my umbrella was being opened and an attempt being made to thrust it into my hand. "Hongkong! No can do!" I cried in my recently acquired pigeon English, "Must catchee *Poyang*." He stolidly shook his head, "No can do," he assured me and pulled me by the arm along toward the *Kwanglee* gangplank. It did no good to appeal to the dock policemen, for they did not understand the language I tried to speak, and were not interested anyway. They pointed in the direction the coolie was trying to urge me, via the tight-grip-on-the-elbow method. I had almost come to the conclusion that to Hongkong I would have to go when the huge form of a Sikh policeman hove in sight. He understood English, and I poured my immediate troubles into his receptive ear. He batted my coolie over the head with his stick (and the impact of ivory, flesh, and hardwood was music in my ears) and put me in my ricsha again; and walked beside the sour-visaged coolie as he directed him to the *Poyang* slip.

Usually, however, despite his unwillingness to risk losing a fare by admitting that he does not know how to get to any particular place, the ricsha coolie is an agreeable creature. He will jog along for hours, singing to himself much of the way. You fear he must be half dead and ready to drop in his tracks, but let another ricsha come up behind him and attempt to pass, and unless he is really completely exhausted (and this rarely happens) he will speed up, for no ricsha man will be passed by another if he can help it. And neither does he want nor propose to let a motor car cut in ahead of him. He will take great chances with the safety of both ricsha and fare rather than let a motor car wind on through a busy street and crowd him to one side.

There is no escaping the fact that though the "foreign devil" pays him more for his services than his own countryman, the ricsha coolie holds all alien races in ill-concealed contempt. In this he is not unlike the rest of his race. Wealthy Chinese and those of high estate have little use, generally speaking, for the foreigner, and the ricsha coolie has even less, and of them all, it is the American he holds in greatest contempt. Yet it is the American who treats him best, and pays him most generously. The Chinese themselves are most cruel to the coolie class. It is no uncommon sight to see a prosperous-looking Chinese kick the coolie who is drawing his ricsha, apparently for no reason. Even the Britisher is inclined to box a coolie's ears for the least mishap, and yet the ricsha coolie would rather draw a Britisher than an American any day.

While it is generally believed in America, that the queue is a thing of the past in China—absolutely taboo by governmental edict—there are a great many yet to be seen in Chinese cities, and even more in the country districts. Usually they are worn by the coolie classes. My own ricsha coolie wears one that comes to the bend at the back of his knees, though I usually make him wear it in a knot at the nape of his neck. He believes that when he dies he will be pulled up into heaven by his queue, and he has no mind to miss heaven just because he was foolish enough to cut his queue to please a few foreign devils here below.

Of course the ricsha coolie is overworked, and he is underfed, as are millions of other Chinese of the poorer classes in this land of great though hoarded wealth. There is but one thing to be expected from years of overwork, under feeding, and insufficient clothing in winter: One never sees an old ricsha coolie, and rarely a middle-aged one. He runs his miles, burns up his body and pants his life out in a very few years. In all China there is, perhaps, no more exasperating class of people than the ricsha coolies, but we couldn't get along without them.

The Case of the Cop Versus Crime

AUGUST VOLLMER, the psychological police chief who made an international reputation as head of the police department at Berkeley, California, was loaned to Los Angeles, the largest city of the Pacific Slope, nearly a year ago. He put on a drive against crime, with the result that, in the last four months of 1923, there were 223 arrests for robbery, 477 for burglary, and 358 for automobile thefts, as compared with 34 for robbery, 127 for burglary and 134 for automobile thefts and all other forms of grand larceny combined, in the same period of 1922, before Chief Vollmer went to the rescue of Los Angeles.

This official is probably the foremost authority in this country on the prevention of crime and the apprehension of criminals. This story tells how he does it.

By AUGUST VOLLMER

Chief of Police of Los Angeles, and former President of the International Association of Chiefs of Police.

(In an Interview)

AUGUST VOLLMER,

The "psychological police chief," who has brought to a sudden end the reign of crime in Los Angeles, and who now demands that all policemen be educated men, of high mental, moral and physical attainments.

I am more interested in preventing crime than in detecting it. After all is said and done, it does not bring a murdered man to life to spend all your efforts in a police department to hunt down the murderers. Yet I believe in the most advanced methods of apprehending criminals. I also believe in patient, scientific and intelligent methods of checking crime at the source, as well as discouraging it by efficient police activity and protection. I believe in the combination of hard-headed, practical methods of catching crooks with the humanitarian viewpoint toward crime adopted by criminologists, and the psychological study of crimes as they are committed in actual day-to-day cases.

The starting point of most crimes is in the homes of the criminals. Lack of proper home environment for children, for boys and girls, and for young men and women is responsible for a large part of our crime today. Girls go wrong for the same reason that boys do. More than the mere desire for better clothes, a good time, or any other material reason, is required to make a boy or girl enter a life of wrongdoing if they have been reared in the proper home surroundings. The criminal class is kept alive by jails as much as by any other one factor. Once a man has committed a crime, he is very apt to be converted into what is known as a "professional criminal" through the present methods of jailing him and keeping him in jail with other older, more experienced and more hardened evildoers.

Our jail system and conditions should be completely changed, not only that we may save the beginner in wrongdoing from himself and from the example of men and women who have advanced further along the criminal path, but that we may demonstrate that our civilization is not cruel and barbaric and revengeful, but that it stands for something finer and nobler than a mere policy of avenging crime, even when it is necessary to punish a human being. I believe that the prison farm idea is the correct plan. An enduring feeling of resentment against society, against law, against his fellow men is given to the prisoner by placing him in a cell, shutting him away from the world, under the influence of other criminals. We seem still to be living in an age where "man's inhumanity to man makes countless thousands mourn." Penitentiaries are still necessary, and will be needed for a long time, for purposes of confining and controlling the hardened offender, for there always will be a criminal class, and there always will be vice, at least to some extent.

It is my belief, confirmed by years of study and experience, that ninety per cent of all criminals are not right mentally. Probably they are not insane, but somewhere in the involved channels of the brain, the impulses to do right have not been able to overcome the impulses to do wrong. The problem of our civilization is to take these unfortunates in hand as soon as possible and give them the environment, medical treatment and mental and moral training which will change their outlook on life to normalcy, instead of clapping them in jail, and then forgetting that they ever existed. Sufficient illustration of my view on this question is the fact that the recognized medical test to determine the sanity or insanity of a human being is whether that person's mind clearly distinguishes and differentiates right from wrong and truth from falsehood.

The police department, as conditions are today, is the main defense of the public against the criminal, yet, despite the importance, intricacy and difficulty of the police problem in all large cities, no scientific study has been made of the subject by officials, schools, or the people at large. As a result of this, police departments have fallen behind in the progress of civilization. In many of the large cities of America, these departments are incapable of performing, in a satisfactory manner, the duties assigned to them. Throughout this country, desperate criminals are at work without fear of arrest, or of conviction if arrested; vice and crime are extremely widespread and obnoxious, while defective control of traffic permits great loss of life and retards the industrial growth of many communities. Executives of police departments realize this condition of affairs, but are balked by the knowledge that any effort to remedy existing evils will fail unless higher ideals and better methods are inaugurated all over the United States.

The "accident board," by which automobile accidents and their causes are made clear to the courts, introduced by Chief of Police Vollmer at Berkeley, California, and shown in use at San Francisco.

The first step in any plan to make our police departments more competent to control crime is the keeping out—rather than the removal after they get in—of undesirable, incompetent, and mentally or physically unfitted persons from the police force. Preventive measures are vastly cheaper, and hundreds of times more effective, both when dealing with crime and when organizing and maintaining a department to combat crime, than the installation of complicated machinery and systems for the correction of personal defects once they have been acquired and have become established. An unfit or an incompetent policeman weakens the moral fiber of his associates and at the same time destroys the confidence of the public in the department. The protective organization suffers, and society always pays the bill when the policemen of a community are dishonest, brutal, stupid, and physically or temperamentally unsuited for their work.

The unnecessary exercise of police powers, arbitrariness, harshness and cruelty actually produce crime, anarchy and kindred social and political ills. Records show that even mentally unstable men have been appointed as policemen, and their instability has not been recognized by commanding officers until these men had killed some innocent person, or committed some heinous offense against the society they were employed to protect. Mental tests, properly applied to men seeking to enter police work, would aid in the elimination of the unfit, the barring of the mentally incompetent, and would classify the applicants according to their various and varied mental capacities and assist the head of the department in choosing from the group men desirable for responsible positions. No mental measuring method, however, is perfect, yet the results obtained in the army, and in educational and industrial institutions, justifies the use of mental tests to determine whether applicants are endowed with sufficient mentality to discharge their duties adequately and intelligently.

Another factor which should be seriously considered in the selection of men to serve as policemen is education. A man's training for police service begins usually after he has been appointed to the force. This is wrong and should be changed. An effort should be made to induce universities and colleges to offer preparatory courses for police service, and to qualify men for positions in the police departments of our cities. The average policeman gets his education from the great teacher, Experience, but by the time he gets it, valuable time has been wasted, and considerable damage done to the community.

Statistics collected by men since I took charge of the police department of Los Angeles show that in 1923, of 294 men whose connection with that department was severed for any cause, 115 were dismissed or quit under pressure, and that the aggregate cost of these "service terminations" to the city was $183,260, of which at least $100,000 might have been saved if the proper requirements for entrance to the police force had been maintained when these men were appointed. Forty service terminations in 1924 are estimated to have cost the city of Los Angeles $19,160.

I am certain that the police department of virtually every city in the United States could be vastly improved, the prevention of crime made more widespread, and the protection of society established much more securely, by the strict observance of the following rules with regard to the police department in each city:

> Establishment and maintenance of higher standards of educational, mental, moral and physical requirements for applicants.
>
> Observation of all recruits by a medico-psychologist during their training period.
>
> Withholding of police authority from the policeman until he has proved by his conduct and his knowledge that he is fitted to discharge the duties of his position.
>
> Petitioning of our universities and colleges to provide preparatory and promotional courses for policemen.
>
> Creation of a division of construction and maintenance in every police department, and the placing in charge thereof of a competent engineer.
>
> Creation of a crime-prevention division and the appointment of a trained criminologist to conduct the activities of the division.
>
> Establishment of a merit system in each police department.
>
> Crediting of police ratings of candidates for promotion on the basis of 50 per cent in civil-service examinations, such ratings to be subject to review by examination boards.

Education of the public and securing its friendship for and co-operation with the police department is the most efficient way to *stop* crime. Education of our youth, and proper home training and environment for them is the surest way to *prevent* crime. Ninety-five per cent of criminals are made before they are ninteen years old. The time to prevent crime is in childhood. Ninety-five per cent of the criminals in this country today were in trouble of some kind in school, and usually did not complete their school lives.

Here in Los Angeles, we have a special detail of police who work on juvenile cases, not for the purpose of clapping boy and girl offenders in jail, or taking them to the juvenile court at the first opportunity, but to look into the home lives of these unruly boys and girls, and to attempt to determine the causes of their trouble at home and their friction at school. In this, the school department co-operates with the police department to good result. If home conditions of boys and girls who have been suspended or are not amenable to school rules are not proper, the authorities take up the matter with the parents. The main idea is to gain the confidence of the boys and girls in question, to study them, and to attempt to find a solution for their problems, as well as to inspire each boy and girl with confidence in himself or herself, and with a desire to do what is right. I believe this method will prove the greatest crime-reducer ever offered, and that it will, in addition, furnish a distinct and valuable contribution to the general strengthening of the moral fiber of the city in which it is carried on, and eventually of the entire nation.

One of our first steps has been to stop the prevalent practice of putting decent citizens into jail for minor offenses, such, for example, as speeding. In the jails these men came into contact often with the dregs of humanity, and with contagious diseases as well. The law is not intended to punish decent citizens for minor offenses. Speeders are not being jailed, but fined, and every consideration is shown citizens, not of the criminal class, where only minor infractions of the laws are involved. This policy is building up good will for the police department and co-operation for the police among the law-abiding residents of Los Angeles.

In this connection I may say that the traffic problem is not rightfully a police problem at all, but one which should be handled by an engineering department.

The Old South Assumes a New Aspect

By G. W. BARRINGTON

NORTHERNERS, generally, are imbued with the idea that their brethren in the Sunny Southland are made of clay which never has hardened—in a word, that they lack the fire of ambition which steams the boilers of energy.

What Northerner, smugly wrapped in his own conceit, has not nodded sage approval while some philosopher explained just why his section is more prosperous and progressive than the region lying "south of 36," as the late Emerson Hough would say it?

It's the climate, you know. No prod to stir a fellow to action. Fruits and vegetables sprouting spontaneously, hogs multiplying in the wood, cattle grazing contentedly on luxuriant perennial grasses, little fuel needed!—A fair picture, but a false.

Comparatively impoverished the southern states certainly are, but not because the Southerner works fewer hours or earns less, but because he spends the greater part of his earnings outside the borders of his own commonwealth.

For instance, Texas produces more cotton than any other state, and more than is grown in any equal area in the world, yet the cotton goods used in the Texan's family costs from fifty to a hundred per cent more than similar goods made and sold North. Texas plants cotton, chops cotton, cultivates cotton, gathers cotton, gins cotton, then *buys cotton* which has been spun, woven and manufactured into the finished article in far-off New England, with from two to five long and short hauls piled up on the price tag before it reaches the cross-road store.

Cotton, while the chief reliance, is not the only article which Texas sells cheaply and buys dearly after it has been hauled about the country at the mercy of the Esch-Cummins Act.

Sulphur mined here, and worth a fraction of a cent on the dump, is made into matches by a firm in Battle Creek.

Common salt is shipped to Pier No. 3, Chicago, to be packaged, labeled, wholesaled, jobbed, and finally retailed to Texans at ten times the price that Texas received for it.

Wool, hides, fuller's earth, paint pigments, even sweet potatoes and molasses leave here in bulk, and return in glittering containers with attractive labels attached, or made into clothing and shoes.

Industrial Transformation

WHEN a lusty son of the South is born, nursie greases his nostrils with "olive oil" pressed from cottonseed, but bottled in Illinois, and washes his blinking eyes with a solution of boric acid drawn from an Arizona desert by twenty mule teams, but refined and enhanced in price a few hundred per cent by a house somewhere east of Philadelphia.

His bottles, brushes, powders, scents, soaps, his teething ring, crib and coverlet, come from beyond the state line, and the only native product offered for his approval may be supplanted later on by a rubber nipple from the Atlantic seaboard, through which flows Grow 'Em's Marvelous Baby Food, distributed under a Cleveland trade-mark.

And as that babe begins life, so he ends it, taking his last long ride swathed in a New England shroud, resting in a Wisconsin casket, reposing in a Detroit hearse.

During the interval between birth and death, he rarely eats or wears or touches anything wholly produced in his native state, and throughout life sees all about him out-state products such as carpets, tapestries, linens, hardware, tinware, structural and other iron, plumbing and gas pipe and fixtures, electric devices, pottery, crockery, cutlery, wire-work, implements, arms, canned vegetables, fruits, toilet accessories, perfumes, condiments, potted meats, stoves, paint, glass, autos, airplanes, locomotives, rails, rolling stock, tiling, lead products, street cars, eye-glasses, clocks, jewelry, steam shovels, scissors, calf-weaners, rubber goods, thermos bottles, toothpicks, thimbles, thread, buttons, pins, needles, earbobs, rock crushers, road graders, pool balls, checker men, crowbars, hair nets, jackknives, wallets, printing presses, axle-grease, wall paper, mirrors, brass-work, and tens of thousands of other articles which cause the Southerner to spend a busy life keeping the golden flood moving outward from his state line to keep the current of necessities flowing in.

Consider that in all that list, and outside it, but a very small percentage of articles may be found which could not be produced ready for use, right in Dixieland.

But just wait a while.

Textile factories are springing up here and there, and creameries, sugar refineries, canneries, oil mills and sirup standardizing plants are commencing the fight which every industry must make in a new field.

Industrial bodies, commercial clubs, farmers' co-operative associations, even the labor unions are having their eyes opened to the fact that the section has been paying useless tribute to the North.

Naturally, the textile industry has come in for first attention under the new order, because the raw product is of first importance here.

Not long ago every spool of thread, every yard of goods used here was made elsewhere; now the southern Atlantic seaboard has more spindles than any other section, and the great Southwest is installing them by regiments.

At first the industry toddled uncertainly, principally because the pioneers, through mistaken economy, installed second-hand equipment, discarded by the northern mills.

Every mill now in process of assembly is modern in every respect, and the men back of it have learned to import expert management from other sections. As a consequence, the industry in this section is fully up to standard, and walks alone.

True, much of the capital employed so far has come from the North, but, excepting dividends so diverted, that will have little influence on results. The great, outstanding fact remains that soon the Southerner will wear clothing grown and made for Southerners, by Southerners, and in the South, which means simply that the entire price of it will remain among those who wholly created it.

No man who loves America will preach sectionalism, or listen to it without protest. The Southerner does not envy the Northerner his dollars, but he needs a few of them in his business, and is out for them; that is his right.

Why has the awakening not come sooner?

First: Because the Civil War closed upon a South which had given its last ounce of energy, its every shilling and pence, to a cause which proved hopeless, and defeat enshrouded the section in a mantle of drear pessimism which it could not easily discard. Four years brought more devastation and discouragement to the region than six decades of groping toward the dawn could eradicate.

Second: As one of the consequences of that struggle, the South isolated herself politically, slumbering in her traditions and imbued with a certain smug Bourbonism which learned nothing, forgot nothing, and consequently taught nothing. She profited nothing when the party she sustained attained power, because its leaders well knew that, no matter how often slighted, she would not desert; she offered no prolific field for proselyting by the opposing party, because it realized the hopelessness of attempting to propitiate her. As a consequence, both parties distributed their gifts of patronage and favorable legislation in those sections where the proletariat has a habit of rising to its haunches and howling avidly when feeding time comes. The South could be depended upon to hew wood and carry water, and never ask for a seat at the banquet.

Third: The original southern colonist was not an industrialist by nature, but a country gentleman reared for generations to a plantation life. When he accumulated unneeded money, it appealed to him, not as cash to be invested in a factory or commercial enterprise, but as the means of opening another field for planting. Enterprise he certainly had, and has, but heretofore he harnessed it to but one task—crop raising.

Has Glimpsed Her Destiny

THE South, in conversation with an outlander, seeks no advice, tolerates no suggestion for improvement, for the South will not admit that there is one little bit of a fraction of an atom of anything wrong with her, in any respect, or in comparison with any people or section or class. It is this complacent self-satisfaction, which, more than any other one thing, has throttled her progress. But—

That was the Old South, bless her, just as she lay a-dream in blissful self-content.

The New South has glimpsed her destiny, and is adjusting herself to its attainment. As she clung to the old way with pride, she will take to the new with vigor eager to prove that her former isolation was not endured because her people were incapable of applying their energy in a profitable way, but because they were proud to be Southerners with all of the Southerner's freedom from mercenary instincts and capitalistic tendencies.

Sentiment still lives here; respect for traditions survives, but standing alongside is a fixed determination to show the inquisitive-minded gentleman from Missouri, and others, that the South can and will accomplish what she undertakes.

When Civilization Tottered at Winnipeg

Concluded from page 9

venture out, and when accosted by a guard, failed to give good and sufficient reason for so doing, it was the hoose-gow for them.

There was little incentive to be out during the daytime, except for the obtaining of food supplies. Business men tramped to their offices, but in the absence of any mail soon departed with a look of "what's the use" on their troubled faces, for no mail had been left at Winnipeg since the strike began. It was dumped off at the stations outside the city. This is better explained by the following editorial as it appeared in the *Free Press* of May twenty-third:

> "What have you done with the people's mail?
>
> "No mail has come to this city for a week. Mail coming to this city from the East, is dumped off at Fort William. That from the West is unloaded at Moose-Jaw. From the South, it is thrown off at Emerson.
>
> "Ability to transmit and distribute mail is one of the primary tests of government. Judged by the foregoing—this government is a complete wreck.
>
> "If the government is unable to deliver, then the citizens will have to undertake the task. Meanwhile—in behalf of an outraged city—we demand, first from the government an explanation. Then without further delay—the mails."

During this time, the Winnipeg *Free Press*, had at great expense and an equal amount of secrecy, brought in a radio sending and receiving set. On the twenty-third there crackled to the outside world from its lofty antenna a true statement of affairs within the city. Back there came from the powerful sending stations of Canada and the United States a message that all was well throughout the broad land.

With renewed vigor, the Committee of a Thousand instituted more rigorous methods. Automobiles were commandeered. Places were assigned them near the city hall. There they waited hour after hour, day after day. Occasionally a riot call came in which they would answer in a wild ride with a load of riflemen; then back to their stations where the weary vigil would be resumed.

Conditions had improved rapidly by the twenty-fourth. They were reflected in the following comment of the newspaper of that date:

> "The public undoubtedly feels that matters reached the pass they did in this city because the constituted authorities did not challenge the spirit of rebellion the minute it showed itself.
>
> "The Dominion Government is now taking account in keeping with its duty, but for a whole week, it displayed a shocking appearance of backwardness. It must be admitted that when on Thursday of last week the mail for Winnipeg was stopped, that fact was immediately reported to Ottawa.
>
> "Did not the postmaster general recognize this stopping of His Majesty's mails as an act of war against the sovereignty of the Canadian Government? If they did so recognize it—then why did they lie down under the affront?
>
> "The fact remains that the post office department got cold feet and allowed the Winnipeg mail to be left off at ports east, west and south. It closed the Winnipeg post office, thereby giving the enemy visible and striking encouragement.
>
> "The people are disgusted with the city council. The strike committee claim them as a consulting party. The fact is—the city council truckled to the Soviet committee in an abject and humiliating manner.
>
> "There is nothing like the police force outside of opera bouffe. Their real allegiance for the last ten days has been to the strike committee, who still boast of permission in allowing it to remain under nominal direction of the chief magistrate."

Sporadic Demonstrations

CONDITIONS in the city dragged along, punctuated now and then by sporadic demonstrations of all kinds, each side holding what advantage it had, or thought it had, until July first, a day the Canadians observe much the same as we do the Fourth of July.

During this time the Committee of a Thousand, working with the aid of the mounted police department, had located a number of chief agitators. On the day mentioned, a plain clothes detective made the rounds of the waiting automobile drivers who were still maintaining their vigil near the city hall. He asked in what shape the cars were. One of them, Robert Howden, gave a typical answer indicating an equally typical condition, when he replied:

"Rotten, but ready to go."

Instructing each one to be armed with a pistol, he gave them cards bearing the letters, H. M. S. (His Majesty's Service) which they were to place in a conspicuous place on their cars. He also gave them to understand that they were to meet returning soldiers at the depot.

When train time came, however, each driver found his car occupied with two or three city police and a special constable, who directed them away from the railway station and to a house on Emerson street, where General Ketchen boarded one of the cars. It became known then that they were after twelve of the strike ringleaders.

Through the dark streets they made their way, swiftly and as silently as their neglected cars could be run.

The first victim was routed out of bed, handcuffed and hustled into a waiting car, before his sleep-heavy eyes were fully open. The next, a minister of the Gospel, protested most indignantly as he was pushed into another of the chugging autos. Then came several foreign-looking men, who fought viciously as the steel rings were snapped onto their wrists. Eleven in all were gathered up and taken to Mt. Royal Prison.

Little is known of the deported Russian Jews. They were apparently sent to Winnipeg for a definite purpose. At the time of their arrival, the banks of Winnipeg reported the opening of three or four accounts, approximately two thousand dollars each, all made in United States currency.

The other Jew had been a resident of Winnipeg for several years. Little is known of him except that he promulgated many Socialistic doctrines.

The remainder of them, Scotch, Welsh and English, were just average men that one might meet in any civilized community. Being possessed of radical views and idealistic natures, they really believed that a modern utopia could be established in Canada, under Soviet rule. How these men could expect any kind of practical results from the line of procedure they followed is beyond all human understanding. Though they reduced the city to almost primeval life—hammered at her civilization until it tottered and rocked on its foundation—their efforts came to naught.

Poison Gases Turned to Peaceful Use

Medical Science Discovers Cure for Many Common Ailments

By WILLIAM A. M'GARRY

A PEACEFUL use for poison gas has been found by two American medical officers. Assuming that a discovery, which they announced recently, stands up as well in general practice as it has in hundreds of tests made at the Edgewood Arsenal, Maryland, the medical treatment of colds, bronchitis, and similar ailments will be revolutionized and eventually four out of every ten human beings will benefit by the relief from the suffering of common colds alone. In the treatment of such havoc-working diseases as influenza, pneumonia, cerebro-spinal meningitis, diphtheria, it is hoped that the high death rates will be reduced to a negligible figure, the fatigue and heart-strain consequent on present treatment made unnecessary, and the germs of the disease killed within a few hours.

Results that justify these expectations have been announced by Brigadier General Amos A. Fries, head of the United States Army Chemical Warfare Service, Dr. Edward B. Vedder, Lieutenant Colonel, and Dr. Harold P. Sawyer, Captain, both of the Army Medical Corps. Colonel Vedder and Captain Sawyer have been making a long series of experiments with chlorine gas at the Edgewood Arsenal. According to their announcement even whooping cough, which is now checked only by a treatment that in the most favorable cases requires six weeks, has been absolutely cured in two hours. The physicians make their statement with reference to this disease with reservations, however, owing to the fact that they have experimented with relatively few cases.

The Results of 930 Tests

PEACEFUL uses for poison gases have been suggested and prophesied before, one familiar idea being the use of such gases for the elimination of insect pests. It is interesting to note that the experiments in this direction have gone hand in hand with research undertaken to find a peace-time use for such high explosives as trinitrotoluol, familiarly known as "T.N.T.," which was considered so fixed in its chemical constituents that much of it was dumped into the ocean after the war. For more than a year, however, ammonium nitrate accompanying T.N.T. has been recovered (in some instances disastrously) for use as a fertilizer constituent. Apparently poison gas is now to follow high explosives into the list of aids to civilization.

Brigadier General Fries made the first public announcement of the new discoveries recently in an address at Philadelphia, which was followed by publication through the American Medical Association of the official report of the two investigators already named. He told how 930 cases of colds, influenza, pneumonia, laryngitis, pharyngitis and other diseases of the nose, throat and lungs were treated after a series of laboratory experiments which determined the efficiency of the poison gas in killing the germs of these maladies. Of that number, according to General Fries, seventy-two and a half per cent were absolutely cured, there was marked improvement in twenty-four and a half per cent of the cases with gradual cure, and in three per cent, where cures were not effected, there were no ill effects from the gas.

"We have been trying to sterilize the lungs of human beings for two or three years," said General Fries, "ever since the end of the war, by introducing a disinfectant to make them free of the germs that cause disease. The tests have proved that chlorine gas, introduced into a room that measures ten feet square, cured a cold in one hour when the poison vapor was introduced continuously in the proportion of one part of chlorine to 133,000 parts of air. The experimenters went before the Appropriations Committee of the House of Representatives at Washington to ask for money to continue their work. They told the committee, headed by Representative Madden, of the results they had obtained, and the committee members expressed a desire to undergo the treatment. As a result, the committeemen were placed in a room for two hours and chlorine gas was introduced in the proportion indicated, and four members who had been suffering from colds admitted that they had been freed.

No Evil Effects From Gas

"CHLORINE in the atmosphere settles on the mucous membranes of the throat, and if there are any germs there, it kills them. It won't kill the tuberculosis germ because the bacillus is deep in the lungs, and the gas can't reach it. But if we could get mustard gas into a tubercular person, into the depths of the lungs, without any other ill effects, we could cure tuberculosis. We are now working out that problem, but what success we will have I cannot predict. Chlorine was the least poisonous of the war gases. It has died out for that reason, and because it turns to vapor too readily to be effective in war. Some of the war gases are not gases at all, but liquids and solids. Tear gas is a solid, which must be burned to give off the vapor which brings the tears to one's eyes.

"In the factories where chlorine and other war gases were distilled, the manufacturers wrote us there were no ill effects noticeable. Letters to members of the medical profession concerning veterans under their treatment showed the same results. When you recovered from gassing you were just as well as when you recovered from bronchitis or pneumonia. There may have been left some little disturbed condition, the system may have been weakened, but once over the gas you were over it. The same we found to be true of mustard gas burns. Dr. Francine, of the University of Pennsylvania, was authority for the statement that not only are there no after effects but a man who recovers from gas poisoning, if he ever contracts tuberculosis, contracts it less seriously and will overcome it more rapidly than a man who was not gassed."

General Fries has incidentally exposed some of the war-time propaganda about the awfulness of poison gas. He points out that the one thing accomplished by gas from the military point of view was to break down vitality. "Only two out of every hundred men who were gassed in the war died," he added, "while fifteen out of every hundred struck by bullets died. If gas had been as deadly as it was made out to be we would have buried at least 15,000 more of our American soldiers in the Argonne Forest. Poison gas was used in the Civil War, but the chemical composition of the gas in question is not now known. At the siege of Charleston, in 1863, there was a gun named the 'Swamp Angel' which fired a shell containing poison gas. Its effects were ghastly."

The direct experiments on human beings with chlorine were not attempted until after Doctors Vedder and Sawyer had made many experiments with germs in their laboratories. In the first of these the work was undertaken to determine how much chlorine was required in the air to kill certain bacteria. These showed, it is reported, that a concentration of 0.021 milligrams of chlorine per liter—less than ten parts to a million—was equivalent with sufficient time exposure. The more delicate organisms, such as the meningococcus and the catarrhal germs, were killed after an hour's exposure. It was then determined experimentally the limits within which chlorine may be safely inhaled by human beings. The odor was perceived when the concentration reached 0.01 milligrams per liter. Irritation of the throat was caused with three minutes of a 0.048 concentration, and it was estimated that the dose of 3.00 milligrams would require thirty minutes to kill. Experiments then were started on human beings, with careful watch of the time required to kill the germs.

"Chlorine has been used on several occasions to prevent certain infections," says the report of the two investigating physicians. "Kuster states that in 1915 inhalations of chlorine were used successfully to clear up meningococcus and diphtheria carriers. Hale used chlorine in unknown concentration at the University of Arkansas during the influenza epidemic, and believed that students who took this treatment suffered less from influenza than others. Employes in plants producing or using chlorine have always believed themselves to be relatively free from respiratory diseases. This was brought to our attention because, during the war, when the chlorine plant at Edgewood Arsenal was producing to full capacity, the great influenza epidemic struck the post, and the hospital was filled to overflowing. It is stated that no cases were recorded during the epidemic among the operatives of the chlorine plant, although every other organization on the arsenal had its full quota of cases. We therefore determined to investigate the value of chlorine as a therapeutic agent.

How Treatments Are Given

"TO TEST the actual effect of inhalation of chlorine on patients, we constructed an air-tight chamber thirteen by thirteen by ten feet, in which five or six persons could sit comfortably, and through which 42,000 liters of gas air mixture could be passed each minute, with an even distribution in the chamber. In this chamber were treated all persons who applied, persons who were suffering from infections which we thought might be amenable to this treatment. In this work a concentration of approximately 0.015 milligrams per liter of chlorine was used, as some persons found that .02 caused slight irritation of the throat. Most of the patients received a single treatment of one hour. While the majority of patients were cured or improved by one treatment, many required several treatments.

"The results obtained were very gratifying both to our patients and to ourselves. There seems to be little doubt that such chlorine treatment will completely abort a cold when taken sufficiently early, and in well developed cases it affords great relief. Acute bronchitis is practically always relieved. There is more difficulty in treating head colds, because the swellings of the mucous membranes stop the air passages and prevent free access to the chlorine. In a number of our later cases, the nose was first treated with epinephrin, to shrink the membranes and obviate this difficulty.

"Our cases of influenza are too few to afford a basis for positive statements. Influenza is difficult to diagnose in the absence of an epidemic, and patients who were ill in bed could not come to our chamber; but we are inclined to believe that chlorine will be as effective in the treatment of influenza as it is in the case of the common cold. Now that we have a portable apparatus that can be used in the sick room, it is at least worthy of a further trial in view of the fact that there is no specific treatment for this disease.

"Similarly, our cases of whooping cough are too few. Our gassing chamber was constructed just in time to treat a few cases toward the end of an epidemic that had already affected most of the susceptible children in this locality, and no further cases have been available. But the results were so pronounced in the cases we did treat that we are of the opinion that it is distinctly curative in this disease. Children who had had numerous daily paroxysms followed by vomiting, and were losing weight, after one or two treatments ceased to vomit, and the paroxysms were greatly reduced in numbers and force. Two of our cases were in adults and were undoubtedly cured, as the paroxysmal coughing ceased entirely following several treatments. The bacillus is an exceedingly delicate organism living on the surface of the bronchial mucosa, and there is every reason to suppose that it may be eradicated by inhalation of chlorine.

"It is hard to overestimate the value of such a treatment. Common colds are the cause of much suffering and disability. In the statistical bulletin of the Metropolitan Life Insurance Company of November, 1923, it is stated that in a group of 6,700 clerical employes, colds occurred at a rate of 420.7 a thousand for the year, with a loss of 6,233 days. It is unnecessary to dwell on the disastrous effects of influenza, and it is well known that the best treatment for whooping cough up to the present time is six weeks.

"It also seems probable that inhalation of chlorine will prove useful in many other conditions that we have had no opportunity to treat. This treatment may be used to free meningococcus carriers of their organisms. No local treatment has proved effective for this purpose. It might conceivably be generally used to prevent the development of further cases in a barracks or crowded camp. Such a sterilizing treatment might be of value prior to operations on the nose and throat."

The chlorine is measured with minute accuracy into the room. As indicated by the two investigators, a portable machine for mixing the gas with the atmosphere has been devised and is now available for physicians. It is necessary only to measure the cubic contents of the room first and to gauge the release of gas accordingly. In the meantime, experiments are being continued at the arsenal laboratory.

Superlatives in the Field of American Sports

Concluded from page 10

of the forward pass when he played. Maybe he would be able to take passes if he played today, and again, he might fail in this respect. As we say, end play has changed greatly and it is impossible to estimate Hinkey's possible value in the modern game.

So, reviewing these three leaders, Heston, Thorpe and Hinkey, the job of selecting the greatest player of all time remains as impossible as ever. All three were great players, undoubtedly, but not one of them was perfect and of the three only Thorpe can be selected as a player who would be an outstanding star today with any degree of assurance. Since Thorpe's football career ended, and this was only a comparatively few years ago, several players have appeared to challenge his right to first place. Among these may be mentioned the late George Gipp, of Notre Dame, and Kaw, of Cornell. Season after season will produce others, for football today is played in all parts of the country and many crack players are developed each year. The game expands. Coaches keep on improving play and adding duties to players that the old stars never dreamed of.

Probably the best three tennis players that America has produced are Maurice McLoughlin, William Johnston and William T. Tilden. One of the three, Tilden, is considered the greatest tennis player ever developed.

Tilden comes nearer perfection than any man that has played. No one ever carried such an assortment of strokes. He has and uses almost every stroke known. And none can rise to the occasion as Tilden does. We would expect Tilden, considering his physique, ability and temperament, to be perfection, but he is not. A combination of the playing spirit of Johnston and Tilden would make a perfect tennis player. Johnston ranks below Tilden because he has neither the variety of strokes that Tilden carries, nor the ability, nor physique, to use all the strokes that Tilden employs, but from the moment he starts a game until he finishes Johnston uses everything he has and tries with every ounce. He is aggressive, driving, consistent. He keeps pounding away, throwing everything he has into the battle. His is the ideal type for competition.

The Dramatics of Tilden

TILDEN is dramatic. He has a strong love for the dramatic. Tilden goes along, losing points, permitting his opponent to come close, challenging, and then Tilden spurts, arises to his best form, meets the occasion and wins in a thrilling climax. Tilden always finds himself in time to finish in the lead. He loves a spectacular climax to his matches and therefore he wastes opportunities to bring about a situation that will enable him to give his audience a thrill at the conclusion of the match. Perfection does not permit of wasted opportunities. Tilden, playing his game as Johnston does, could be called a perfect tennis player but Tilden does not do that. In tennis, as in other sports, the leaders of the game are not without flaws. They can be called great but certainly not perfect.

McLoughlin was a powerful player. McLoughlin had a great deal of drive. He achieved his success by the wallop, for his game was to smash a tennis ball so hard that it could not be returned. He was, perhaps, the most spectacular player of all time and his method caused general adoption over the entire country.

All of which is meant to illustrate that the perfect performer is unknown to sport and that it is difficult rightfully to apply the superlative adjective when discussing sports.

BRIEFLY TOLD

Alexander Billmyer, former Congressman from Pennsylvania, who died recently at his home in Washingtonville, Pennsylvania, was so filled with remorse at having shot a fine deer twenty years ago that he started a park in which he kept many wild animals, deer and elk being the principal attractions.

Seaweed is cultivated for human consumption in Japan.

The word "fortnight" is a contraction of "fourteen nights."

Theodore Morse, the man who wrote "Hail, Hail, the Gang's All Here!" "Blue Bell," "Goodbye, Dolly Gray," and other one-time popular melodies, died recently at the age of fifty-three.

Noiseless airplanes have proved successful in their first tryout at McCook Field, Dayton, Ohio. Equipped with the new silencers the machines lose less than three per cent of their power.

A slot machine for changing dimes, quarters and half dollars has been adopted by the New York City street car company to displace the twelve hundred persons now occupied in changing money at the entrances to New York's subways. Bad coins are held and no change dropped.

The United States Senate has passed a bill authorizing an appropriation of $7,500 to defray the expenses of Frank L. Greene, Senator from Vermont, who was the victim of a shooting affair between bootleggers and revenue officers in one of the prominent streets of the capital city some time ago.

Russian authorities on Bering Island, where the American round-the-world aviators rode out in a severe snowstorm, objected to the Americans taking refuge in Russian territory, because of America's failure to recognize the Soviet.

Isle Saint Louis, in the Seine, refuses to be united governmentally to the fourth arrondissement, of which Paris is a part. The island, which was the first part of Paris to be settled, threatens to appeal to the League of Nations to preserve its independence.

Forty ostriches, with their Italian jockeys, go to Berlin for ostrich races and handicap events with horses.

The American potato bug has invaded France, and Germany has begun guarding her frontiers against a possible invasion of her territory. The pest was first introduced into France in the region of Bordeaux by a shipment of potatoes to the A. E. F. during the war.

Captain William Rule, of the Knoxville (Tenn.) *Journal and Tribune,* believed to be America's oldest active editorial writer, celebrated his eighty-fifth birthday at his desk recently.

The first post office in the United States was established in Boston two hundred eighty-five years ago.

A storage battery on charge gives off hydrogen gas, and this gas, when mixed with the oxygen, forms an explosive. For this reason one should keep one's face and lighted matches away from the vent of a battery while it is on charge. Use electric flashlight.

"The International Jew," a four-volume series on the Jewish Question, may be obtained from The Dearborn Publishing Company, Dearborn, Michigan. This set includes:

"The International Jew," Vol. I, 235 pages; "Jewish Activities in the United States," Vol. II, 256 pages; "Jewish Influence on American Life," Vol. III, 256 pages; "Aspects of Jewish Power in the United States," Vol. IV, 246 pages. The price of these volumes is twenty-five cents each; the complete set, four volumes, one dollar.

The city council of Greenfield, Indiana, has appropriated $10,000 to be expended on a James Whitcomb Riley memorial park, a forty-acre tract on Brandywine Creek, near Greenfield, the birthplace of the Indiana poet.

"You've got to educate the American people to what you want to give them. Our forefathers used to have ballyhoos in front of the theater to get the public in. Today methods have changed, but the principle is the same . . . . I don't care anything about the traditional theories of stage production. All I ask is that it (the production) will give me a kick that I think will kick back to the public—but it must be a hell of a big kick."—*Morris Gest,* touted alien purveyor of entertainment to American Boob Gentiles.

The West Coast, and especially California, is producing eggs during the entire year, and fresh eggs can be shipped and be in the hands of the consumer ten days from the time they are laid. This ten-day egg is superior to the storage egg, such as is usually sold from Christmas until March.

A rifle which bore the name Alexander Selkirk (Robinson Crusoe), and the date 1701, was sold for more than $1,000 at a London auction.

The endowment of the Smithsonian Institution now amounts to approximately $1,200,000. This principal sum is deposited in the United States Treasury and bears interest at six per cent.

In Northern Germany fossil sea urchins are known as toadstones. Superstition ascribes medicinal virtues to them.

Practically no taxes in China. The Chinese national debt amounts to about five American dollars per capita while that of Great Britain is three hundred and thirty times as large.

Of India's 155,000,000 women, only two per cent can read.

At the January meeting of the Executive Committee of the Third International, two and a quarter million dollars ($2,250,000) was voted for propaganda in America in 1924. Two questions: Where do they get it? With whom do they spend it?

"In this discovery of Tutankhamen's tomb we find that even in utilitarian objects therein, where art is not a necessity, refinement has always the first consideration."—*Howard Carter.*

Hawaii has the highest mountains of any islands in the world. Two peaks rise nearly 14,000 feet into perpetual ice and snow.

In this present year of 1924, some 280,000,000 white people are directly or indirectly controlling the destinies of more than 900,000,000 yellows, browns and blacks.

Sixty per cent of the world's whale fishing is done by Norwegians, and the Christiania correspondent of the London *Morning Post* estimates the yield this season at 70,000,000 crowns. Nearly the entire output was sold to America.

The Swedish Match Corporation becomes the largest industrial concern in Scandinavia, its capital stock amounting to about $48,000,000.

A plan to use poison gas in warfare was submitted in March, 1812, to the British Prince Regent but was not adopted. It consisted of fireships carrying masses of burning sulphur and charcoal driven against the enemy by the wind.

Inside the case of a nickel watch picked up on the beach of Colwyn Bay, England, there has been found a slip of paper containing the following in indelible pencil: "Thomas Spanswick, on the Lusitania, torpedoed."

Crews of ten German trawlers fishing off Aberdeen struck work because they were paid in German money.

The British national debt, if piled up in one-pound treasury notes, would reach an altitude of 4,835 miles.

"The Hillocks," Ramsay MacDonald's house at Lossiemouth, stands on a patch of ground covered with whins and broom, but these bushes, with their golden bloom, are rapidly disappearing owing to visitors carrying them off as mementos.

In gold production Canada is exceeded only by the Transvaal and the United States.

The blood orange is obtained by grafting the sweet orange onto the stem of the pomegranate

The supply of white cedar of Japan is controlled by the Imperial family and is considered practically sacred. All of the wood eighteen inches and up in diameter is reserved for the building of temples. A Japanese paid $1,100 in gold in America for a choice beam of white cedar eighteen inches square, twenty feet long, with perfect diagonal grain.

The new ruler of the German Communists is a Vienna Jewess named Ruth Fischer. She succeeds the late Rosa Luxemburg and is an associate of Bela Kun (or Cohen) the leader of the Red Terror in Hungary.

Of the 76,000 ounces of heroin now used annually in New York City alone, only fifty-eight ounces are prescribed by physicians.

More than 30,500 miles of Federal aid roads have now been completed.

White strawberries have been produced and ripened at Johns Hopkins University.

The Braille Press of Los Angeles is issuing a complete Bible for the blind.

Do Women Know How Leaders Commit Them?

Woman Writer Gives Splendid Discussion of a Very "Touchy" Matter

The *Atlantic Monthly* in its June issue printed an article entitled, "American Women and Paternalism," by George Madden Martin, permission to reprint which has been given. It is an article worth reading in its entirety in the *Atlantic*. THE DEARBORN INDEPENDENT is interested in women's organizations to the extent of helping them avoid the pitfalls into which certain policies are sure to fling them. Unfortunately, our efforts have thus far proved unpopular with the professional type of women's leader, but we have no doubt of the efficacy of reason with the rank and file of American womanhood.

IS THE American woman, judged by what she has done with the vote and by what she is endeavoring to do with it, paternalistic by nature and habit? Is it that she sees in the central government what the primitive woman saw in her lord and master? That she seeks her legislative ends through the Federal arm as she from the beginning of the race has sought her personal ends through the strong arm of the individual man, and its power to defend, ensure and enforce?. . . .

It seems to me, when I consider what we women here in the United States have done with the vote in the first three years of our enfranchisement, and are planning to do, that Uncle Sam in the minds of the American woman today, stands in her political world as the Southern father stood in his household; as the strong arm of her lord and master stood to the earlier woman; that is, as the agent or instrument, the authority or vested power, through which the individual, or the individual group, shall and must move to obtain its ends.

Keeping in our minds, then, the question, "Is the American woman paternalistic?" suppose we take as our measure of values the following premises left us by two of the forefathers.

Washington says:—

> If, in the opinion of the people, the distribution of the constitutional powers be in any particular wrong, let it be corrected in the way which the Constitution designates.
>
> But let there be no change by usurpation, for this, though it may in one instance be the instrument of good, is the ordinary weapon by which free governments are destroyed.

Lincoln says:—

> It is my duty and my oath to maintain inviolate the rights of the States, to order and control, under the Constitution, their own affairs by their own judgment exclusively. Such maintenance is for the preservation of that balance of power on which our institutions rest.

With these premises in mind, suppose we look at what the women here in the United States have done with the vote through national legislation, from November, 1920, to December, 1923; and what, through national legislation, they are endeavoring to do.

One of woman's own organs, the *Woman Citizen*, says:—

> When one speaks of woman's national legislative work, one means that Washington group representing fourteen national organizations which make up the *Women's Joint Congressional Committee.*
>
> And since we want to realize who are the women seeking to influence government, it may be a good thing to line them up here:—

American Association of University Women
American Home Economics Association
General Federation of Women's Clubs
Girls' Friendly Society in America
National Congress of Mothers and Parent-Teacher Associations
National Consumers' League
National Council of Jewish Women
National Council of Women
National Federation of Business and Professional Women
National League of Women Voters
National Women's Christian Temperance Union
National Woman's Trade Union League
National Board of the Young Women's Christian Association
Service Star League

Besides the fourteen groups here named, there is the National Woman's Party, which also is exerting political influence in Washington. The activities of that group are not touched on in this article, however, discussion of them calling for a separate consideration.

It is the first-named fourteen groups which, representing some millions of women and concentrated in this Women's Joint Congressional Committee, put their strength behind and won—or aided in winning—the following measures:—

The Sheppard-Towner law. "A measure for women, won by women," designed to secure through combined Federal and State aid the protection of mothers and new-born babies.

The Cable law. "A measure of straight feminism," establishing through Federal control the right of a married woman to citizenship independent of her husband.

They also:—

Made permanent: The Woman's Bureau of The United States Department of Labor.

Helped to secure: The bill for the reclassification of the Federal Civil Service.

Gave assistance in passing: The Voight bill to prevent the shipment of "filled milk" in interstate commerce.

Exerted pressure to get: A Federal Coal Commission appointed.

Measures asked for by women, but not yet won, are:—

The continuance of the Inter-departmental Social Hygiene Board by its transference to the Department of Justice.

A Child Labor Amendment to the Constitution.

The Fess Amendment to increase appropriations for training in home economics.

A uniform divorce law.

The Sterling-Towner, or Sterling-Reed Bill, as it is now called. A measure asking for a Federal Department of Education, with a secretary in the Cabinet, and one hundred million dollars annually to be distributed; fifteen millions for the maintaining of the department, and eighty-five millions for distribution among the states under the observation of this secretary.

Here then are the things which the women of the United States have done with the vote through national legislation, and are trying to do. Excellent measures in themselves, every one of them, no doubt, but in their nature paternalistic. All tending toward a centering of the governing power, which in turn means excessive government regulation and a piling up of the bureaucratic system. Yet the millions of women who—through these organizations and this Women's Joint Congressional Committee—are behind these measures are convinced as to their excellence, and conscientious in their endorsements. Of this I am sure.

They are convinced, and they are conscientious, that is to say, *so far as the individual women who make up these organizations know anything about these measures.*

To instance: The General Federation of Women's Clubs is, at this moment of writing, behind the Sterling-Reed Bill. Yet of sixty individual members of clubs within the Federation, recently asked for their opinions on this measure with its proposed Federal assumption of what up to now in our national history has been the duties of the states, fifty-three, by their own statements, never have heard of it.

Herd instinct is as common to women as it is to men. The American woman not only is as gregarious as the American man,—as is evidenced by her nation-wide passion for group organization,—but she, within her clubs and federations, is even more ready than, say, the male rotarian, optimist, booster, and so on, to accept leadership unquestioningly. In this, it may be, she is but running true to her centuries of inclusion within the group which functioned through its vested head. Whatever the explanation, it is my experience that "isolation through intellectual withdrawal" is rarer among American women than among American men.

Relying upon our leaders, the mass of us organized women too often know little or nothing about the measures which we from time to time endorse. And as a woman's club member of thirty-one years' standing myself, I hold I've a right to an opinion.

"George," in the person of the accredited male, has "done it" for women through so many centuries that George today, as personified by our accredited women-leaders, is a change only in sex and personality. And often the immediate George, in the person of a local woman-chairman who presents a measure or a cause to her club, is speaking at the instance of still another George, in the shape of a central or national board; or again, at the request of some other organization.

Mrs. B——, the local chairman of our own or any club, arises on the appointed day. Her proposed interpolation into the business or the program for the day has been arranged for, expedition through well-oiled machinery having come to be more and more necessary in club routine.

Mrs. B——, who is an experienced parliamentarian, is also a specific thinker, concerned not with general principles as a rule, but with concrete business. She has assembled her case with efficiency—which is to say, she has assembled for her use all those points supplied her by the sponsor back of this measure or cause, which are favorable to it. This does not mean that this measure or cause is fundamentally vital or even dear to Mrs. B—— or, at any rate, dear to her prior to the day before yesterday when as chairman of, say, general legislation, or child welfare, or forest conservation, or what not, she in the routine of her official business became the spokeswoman for it. Nor does it mean that Mrs. B—— lacks in conscientiousness. It means, on the contrary, that she, in accordance with her ideas of a departmental chairman's duty and loyalty, is doing her best for the measure. And in accordance with her ideas of a chairman's routine duty and efficiency, she is getting her measure successfully across and out of the way, with as little loss of the club's precious time as may be.

The chairman, having thus done her part, sits down, and the presiding officer glances at the watch upon her desk. It is nearing five o'clock, which is the hour for adjournment and home.

"All who are in favor of this club going on record as endorsing this bill now before the legislature of our state,—or the House, or the Senate, at Washington,—will please say *Aye.*—The *ayes* have it."

Nor is this an exaggerated illustration of the methods by which false impressions are often conveyed by committees who, seeking to influence legislation, claim they voice the demands of the millions of women within the various organizations.

These herd habits among organized women were grave enough prior to 1920. But with woman now an enfranchised citizen, such group movements, under leadership, and free of the individual responsibility, assume graver possibilities for mischief. "Boomerangs" suggest themselves to the mind; also "edged tools"; and again, "Fools rush in" and so forth.

Obediently and pliantly we women within our organizations thus endorse, apparently unaware that no thinking creature has a right to an opinion on any subject touching the public weal unless it rests upon the best information to be had on the subject by the individual.

Conceding to these accredited women leaders of ours this full understanding and consequent right to an opinion, why is it that they knock so constantly, and in our names, at Uncle Sam's door?

Johnny, symbol for the state machine, say, is wasting the forests of his state, even as Johnny, the small son of some woman among us, in his day wasted the contents of the cookie-jar. Johnny's mother, had she appealed to Johnny's father to punish the son for a transgression coming within her jurisdiction, would have been acknowledging her own incompetency. And these women leaders of ours are acknowledging themselves, and us, to be poor citizen-housekeepers within our individual states, when they cry in the name of the women of the state, "Uncle Sam, make us a law, a Federal law, requiring—yes, compelling our Johnny, who is wasting the forests here in our state, to behave."

Why Uncle Sam, and why a Federal law? When it is clearly our duty as responsible parts now of our local governments, to make our own state behave—our duty to remember, if indeed we've ever grasped, that in respect to our Federal Government "an irreducible minimum of compulsion is the very essence of good government." . . . .

We reach another point here. Woman throughout her long past, with her narrowly centered activities, has not concerned herself with the sources whence her needs are supplied. From her place beside the newborn, the suffering, and the old, she has looked to man:—

"Bring the herb, the exorcist, the physician, the leech, the surgeon."

So woman here in the United States today, with her thoughts centered upon the innumerable children who through illiteracy are deprived of their chance in life, looks to Uncle Sam.

"I want better schools and more of them. I want higher pay for teachers. I want longer school terms. I want equipment, and plenty of it. I want illiteracy wiped out, and wiped out quick, and you to pay for these."

An uncle of mine, back in those same days when I was a child and greenbacks were the legal tender, one day brought me a newly minted silver half-dollar. I plied him with questions.

"Where did you get it?"

"From Uncle Sam."

I grasped this: "Where did he get it?"

"From his mint, where his money's made."

Whereupon I saw Uncle Sam's mint pouring out silver half-dollars as a certain old water-mill known to me poured out cornmeal, and Uncle Sam filling and refilling his pockets at need.

It almost would seem that the American woman in her turn thinks of Uncle Sam's money as inexhaustibly at hand. That she does not grasp, for example, that our Federal Government, in order to give one hundred million dollars to the states every year for education, as she is urging that it shall, must take these same hundred millions out of the pockets of the people in these states. She, on the contrary, appears to think that the states in such event will be the recipients of bounty—beneficiaries who get something for nothing.

The American woman has been accused of lacking the laboratory—the scientific—spirit: this in the business of the home, as in other affairs which are her own. The spirit, that is, which experiments in the small, and having reached a better and closer knowledge through observation, trial, and reasoning, offers the conclusions to the world.

Woman in the United States, as represented by these fourteen organizations, is putting her strength—at the moment these words are being written—behind a uniform divorce law. Within the scope of such a law, the antipodes, as it were, are to be brought together, which is to say, South Carolina and Nevada. There is more here perhaps than at first appears.

South Carolina, to take her case first, never has recognized divorce, and may have her ideas about this. It is possible even that the women within these fourteen organizations will be up against a bit of psychology here themselves—state psychology. South Carolina—or so those who know her at all suspect—sees in this stand of hers, maintained through a hundred and thirty-odd years, not alone the isolation of the higher virtue but—and here we reach the crux—a social withdrawal, a class distinction, a group elegance. Were she less well-bred, were she not the scion of a genuine aristocracy, she

(*Concluded on page 14*)

When Mars Calls on Mother Earth

Rare Opportunity to Solve Existence of Life on Planet

By CAPT. T. J. J. SEE, U. S. N.

Professor of Mathematics and Director of the United States Naval Observatory, Mare Island, California.

(In an Interview)

ON AUGUST 22, this year, one of the most interesting of the planets will pay a brief visit to Mother Earth. That is to say, Mars, the red planet, and the Earth, the green planet, will approach within approximately 35,000,000 miles of each other. The exact figures are 34,475,847 and a fraction miles, not a very friendly call, as earthly distances are measured, but rather close proximity when the tremendous stretches of sidereal space are brought into consideration. Mars has been known to observers of the heavens for many centuries, but this passage of the planet so close to the Earth is of especial interest because it may give an opportunity for the determination of the answer to the question, is there life on Mars?

The problem of the existence of life on the planets other than the Earth is of the greatest interest, not only to astronomers, but to all thinking men. The Earth being a planet and teeming with life of all descriptions, should we consider life as a general phenomenon of nature, observed everywhere on this planet, and yet refuse to grant that this same natural phenomenon may appear upon other "worlds," possibly in different forms from the life we know on Earth, but nevertheless life? The great development which has been made in modern science finds such a one-sided philosophy unsuited to the knowledge we already possess of the other planets and of the conditions necessary to produce and maintain life as we know it. But, to support the belief that life may exist on other worlds than ours, and to refute the apparently preposterous idea that life has been granted to our own tiny world alone of all the millions of worlds in the universe, we must bring out the reasons that life may be assumed to exist on Mars—and, while we are on this subject, on Venus as well, since these two planets are most like the Earth of all the bodies of the solar system.

Mars is approximately one-half the size of the Earth, being some 4,200 miles in diameter, as compared with our 7,963 miles. The Earth makes one rotation on its axis in twenty-four mean solar hours, or 23 hours, 56 minutes, 4.06 seconds, sidereal rotation. Mars rotates on its axis in 24 hours, 37 minutes, 22.67 seconds. The Martian day is thus longer than ours, yet only some 41 minutes longer, and the evidence is that the Martian day is only slightly different from the terrestrial day. The obliquity (slant) of the Earth's equator to the ecliptic is 23.5 degrees; that of Mars' equator, in respect to its orbit, is approximately twenty-four degrees, almost the same as that of the Earth. For this reason, the change of seasons on the Earth and on Mars is virtually the same.

The year, that is to say, the period of revolution around the sun, of Mars, on the other hand, is nearly twice the length of the earthly year, being 687 days. For this reason, the seasons there are practically double those on Earth, and these Martian seasons, therefore, change with slowness nearly twice that of those to which we are accustomed. Vegetation upon Mars, supposing that there is any, would have twice the time in spring and summer in which to grow, and twice the time to lie dormant in autumn and winter, that it has on the Earth. But the most remarkable discovery about Mars, and one of the most wonderful scientific discoveries of all time, is that the planet has an atmosphere. Through the most powerful of telescopes we can see, and already have photographed, *clouds floating in the Martian atmosphere.* This discovery is due to the work of Dr. Percival Lowell and his associates at the Lowell Observatory, in Arizona. These men have been studying Mars carefully, night after night, for more than thirty years. The amount of work they have done and the number of records and reports they have made are almost beyond comprehension for accuracy, detail and scientific value.

To understand conditions as we know them on Mars, it is necessary to refer to the group of photographs of that planet shown herewith. These figures are from original photographs taken at the Lowell Observatory, and the upper row of images, made in 1907, show in most beautiful and distinct form the south polar cap and the so-called "continents." These pictures were made by a photographic process which is very rapid considering the tremendous distances involved. Many photographs are taken, each in a fraction of a second, and among these, the image of the planet when best seen comes out on the film, just as it does on the retina of the human eye when the latter is applied to the telescope. The advantages of the photograph in astronomy are threefold: it eliminates the doubt as to accuracy which accompanies drawings, it forms a durable record, and it preserves details which might be overlooked by the eye of the observer.

Captain T. J. J. See, U. S. N., Professor of Mathematics and Director of the United States Naval Observatory at Mare Island, California. Professor See is shown taking an observation for correction of time.

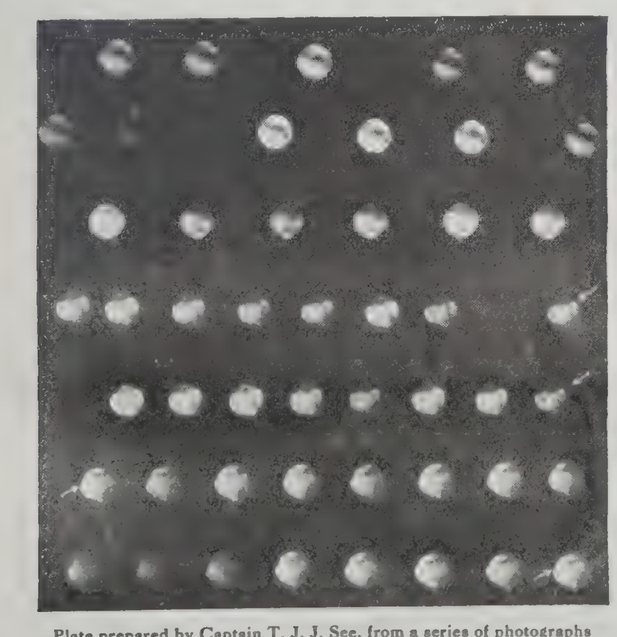

Plate prepared by Captain T. J. J. See, from a series of photographs of Mars. These are of especial interest because they show clearly the clouds hovering around the planet, proving that Mars has an atmosphere not unlike that of the Earth, and, therefore, capable of supporting animal life.

On the next lower row of images—the third from the top of the plate—are the photographs taken in 1916, and showing the north polar cap, just as the upper rows showed the south polar cap. Observation through many years has shown that these polar caps decrease in area with the advancement of the summer season on Mars. This means that these caps are composed of snow and that the melting of the snow decreases the cap, just as it does with the polar caps of the Earth. It follows from this that the seasonal effects upon Mars are very similar to those upon our planet.

The two lower sets of images, made at different dates in 1920, show the polar caps less distinctly, but are of even greater value scientifically, because they show actual clouds floating in the atmosphere of Mars. Parts of the surface of Mars, known to be dark, are shown as whitish areas in these photographs. This whitish color is due to the clouds in the Martian atmosphere, showing white, by reflection of the sun's light, just exactly as clouds do in the atmosphere of the Earth. At the time these photos were made, Mars was, perhaps, forty million miles from the Earth. Is it not a marvelous triumph of modern science that these clouds actually have been photographed as they hover in the atmosphere above the surface of this strange and vividly colored planet which is so soon to pass closer to the Earth than it ever has passed since men have been keeping records of the movements of the heavenly bodies!

From what is shown by these photographs, it follows in logical sequence that Mars has an atmosphere, and that it also has seasonal conditions not unlike those of the Earth, both atmosphere and seasons being suitable for the production and maintenance of life. The atmosphere is rare, like that in the Himalaya Mountains of Asia, or in the Andes of South America. This much is perfectly certain, and not speculative. Therefore, we may be sure that if certain animals on our own earth, such as man, the llama of South America, the Andean condor, the yak of Asia, and other creatures accustomed to living in the rarefied atmosphere of high altitudes on this globe, were to be transported to Mars, and landed there without injury, they could breathe the Martian atmosphere, and could live there very comfortably, provided vegetation exists on that planet.

It is, therefore, completely probable—indeed, I may say, certain—that Mars is teeming with some forms of life, perhaps many and widely varied forms, possibly forms of which we have no conception. We cannot say that this Martian life is similar to those forms of life which we know on Earth, except that the forms of life on Mars have bodies animated and controlled by nervous systems. Sense and power of locomotion similar to that possessed by the forms of life on Earth are likewise possessed by the forms of life on Mars. All elements on that planet are favorable for life, just as they are on the Earth. Friends not infrequently ask me:

"Do you think any of the planets are inhabited?"

And I reply:

"Yes, at least one—the Earth."

Now I can say:

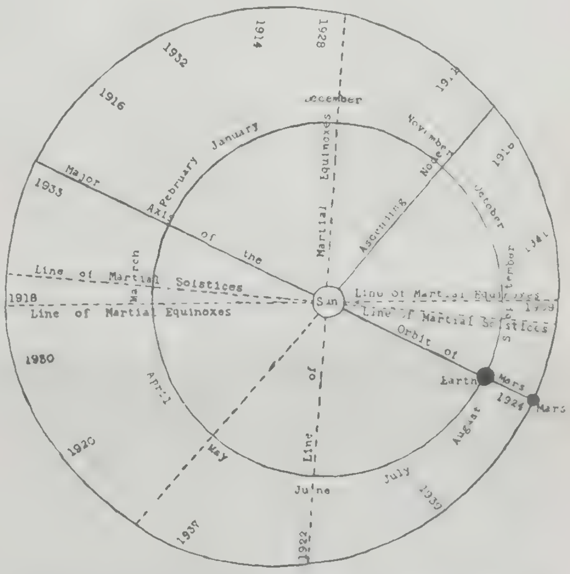
"At least two—the Earth and Mars!"

But the Earth has a twin sister, also a planet, called Venus, just about the same size as the globe on which you and I live. Venus has an abundant atmosphere, a cloud-covered surface, and seasons not so very different from those on the Earth, because the clouds in the atmosphere reduce the sun's heat, which is greater on Venus than on our world, so that only part of that heat reaches the surface of the planet. All evidence at hand indicates with comparative certainty that the surface of Venus has about the same temperature and moisture as the tropical sections of the Earth. Therefore, Venus is just as likely to be filled to overflowing with life as Brazil, Central Africa, or India.

The best observations by the most skilled astronomers and the most careful and capable calculators indicate that the day on Venus has a length of twenty-three hours and twenty-one minutes, or thirty-five minutes less than our terrestrial day, just as the Martian day is forty-one minutes longer than the Earth's day. But the year on Venus is only 225 days long, compared with 365 days on Earth, and 687 days on Mars. But the atmosphere of Venus is so filled with clouds which reduce the amount of heat reaching the surface of the planet from the sun, and the obliquity of the equator of Venus is so small, that it will be seen readily that the seasonal changes on Venus are very slight. As a result of these conditions, the climate there is very like that of equatorial Africa or Central Brazil.

In my opinion it is virtually certain that Venus is habitable, and by a range of life more varied in form and far wider in character than could exist on Mars. Almost any form of life that we know on Earth—unless it be the polar bear and the walrus—could survive and flourish on Venus. Why should not Venus be inhabited? If we hold that the Earth alone, among all the billions of habitable worlds in sidereal space, is inhabited, it seems to me that our belief is untenable. Modern scientific discoveries do not warrant any such conclusion. All the fixed stars are suns, like our sun, but often larger, some of them many times as large, and most of these fixed stars—which number about one billion—have planetary systems around them, just as our sun has its own system, with Neptune, Jupiter, Mars,

(Concluded on page 14)



Orbits of Mars and the Earth, showing the respective positions of these two planets with regard to each other and to the sun for every year from 1909 to 1941, and for every month in the year. Mars and the Earth are shown in the relative position to each other and to the sun, in which they will be on August 22, 1924, when astronomers expect to learn definitely whether there is life on the red planet.

The ranch is a corner stone among American institutions. Bowing before expansion, it has not stepped aside.

The Disappearing Ranch

PART II

By MAX BENTLEY

WHEN Noah Webster in his old blue-backed dictionary defined a valley as "a basin between two ridges," he did not have in mind any particular valley. What a concession it must have been from his positive and mathematical mind to add, in general terms, that "valleys usually are fertile"! The modern unabridged dictionary avoids irrelevant comment, so, when you go traveling through its pages, while you are informed you are generally uninspired.

This writer went traveling the other day, not through the pages of the dictionary, but through the pigmy mesquite forest and shifting sandhills of lower Texas. He was looking for a valley—and a ranch. There was a certain definiteness in that jaunt of his. He wanted to prove to his own satisfaction (before he broadcast it) that a rather positive statement he had recently made was fully true. That statement was that if, as alleged, our good old-time American institutions are gradually succumbing to so-called progress, there is at least one, of whose "disappearance" much is heard, which remains—aye, grows greater—and the tradition of it is still intact. That institution is the Ranch. To prove his statement, he was bound for the Santa Gertrudis Ranch, established by the late Captain Richard King and held intact by his widow today; a ranch of one million acres, the largest in America.

To find it, he rode a day and a night, through miles of scrub brush, across leagues of grazing land in appearance still as primitive, as one sees it from the train, as the first home of our fathers. In that wild country men still think in the raw and live out their lives as the *haciendados* lived before them. Like the Australian brush dweller, they might be "ten thousand miles from anywhere." The wind still swoops down to suck up whole sandhills and blow them over the universe, including the railroad track. The traditional section house with its clean-swept yard still serves as flag station; and here and there a small station house and water tank still rise out of the mesquite and sand. Tawny cowboys who speak softly in an alien tongue and wear tall *sombreros* still lope up on their "paint" ponies, and lounge in the saddle while the engine "takes water." They pose, these guileless men, with an exaggerated nonchalance, but with furtive eyes, on the row of Pullman cars against whose windows faces are timidly (and perhaps quakingly!) pressed: the faces of women folk come down from Nebraska to help their men raise cabbage on forty-acre irrigated farms in the alluvial belt lying immediately next to the Rio Grande, south of the big ranch country.

It is like rushing through a book to reach the climax. Everything north of the ranch country of the Rio Grande Valley is simply scenery; purposely made monotonous, one almost believes, to accentuate the contrast. From any base—from, say, the Texas city of Houston to the town of Kingsville, where the King ranch "heads up"—the traveler sees and hears nothing that does not remind him of home. The same sort of big towns and little towns, the same smoothly efficient train service, the same rubber-stamp conversation in the smoking room: the Ruhr, Coolidge and the nomination, and yes, Volsteadism. It is slightly tiring.

Below the twenty-ninth parallel the ranch country begins; that is to say, the King ranch country begins. Thence southward it is transplanted Mexico . . . .

The train whistles for Kingsville before it is day. You roll over in your berth, raise the shade to peer out, and clutch mechanically at the covers as a black hand touches your shoulder.

"Boss," an unctuous voice says, "dis am Kingsville."

And so it is, although it might as well be Timbuctoo. There is nothing to see. The morning fog has crept in from the Gulf of Mexico. An atmosphere of mystery is about. Distance is obliterated, perspective has vanished. The early morning sounds through the fog are detached and solemn, like "the disembodied voices of the night." You alight and stand around in a state of helplessness.

A voice murmurs your name, off to the left. You answer in a positive panic.

"Where are you?"

"*Aqui, Señor.*"

It is a *mozo,* from the ranch. He has been sent to meet you. He thinks you are somebody—he has called you *Señor.* But it doesn't matter. If he had tartly said "*Donde, hombre!*" you would have groped your way gratefully to him. Confidently he leads you past the hotel to a big blue automobile with motor still throbbing. He opens the door deferentially, carefully deposits your suit cases beside you, bestows on you a flashing smile apropos of nothing (unless he is reassuring you) and takes his place at the wheel. The mist is thinning, stringing out in fantastic wisps that linger close to the ground. Then it vanishes altogether. The sun—large, round, and red—pops up suddenly over the sand hills. The *mozo* leans on the wheel, the car backs and whirls with a suddenness suggestive of an ambitious young broncho. You are on your way to the King ranch.

You arrive in ten minutes. The hundred-thousand-dollar ranch house is only three miles from the town. It was built on a hill and its Moorish-Spanish façade dominates the flat, flower-carpeted landscape for miles around. White and red, turreted, massive, blazing in the sunlight, it suggests something more than wealth. You get the idea of permanence, power. It seems to say: "Time has come and gone and come again, familiar scenes are changing, but here am I. Here will I be when *you* are gone."

A stocky man of nearly seventy, with a shock of curly iron-gray hair, stands on the broad veranda. This is Robert J. Kleberg, son-in-law of the late Captain King and general manager of the ranch. He greets you with a brief wave of the hand, and escorts you to the office in a sunny corner of the mansion. Lemonade is brought by a soft-stepping *mozo.* A brief rest, and you are taken through the house.

"Wrastlin' calves" on the range. A football scrimmage is not a bit more strenuous than tackling, throwing and branding a lusty young calf. There are 100,000 head of cattle on the King ranch, with an annual calf crop of 50,000—all fine stock.

There are long, cool, high rooms with beamed ceilings. Rugs of bearskin and spotted mountain lion (the animals were killed on the place) cover the floors of hallways and *salas.* Hanging on pillars in the main hall are mounted deer heads—lordly heads, with spreading horns: eight, nine, ten prongs. Yes, there is some wild life left on the ranch; some hundreds of deer, wild hogs, mountain lion, wolves, and the largest drove of wild turkey in Texas. The non-predatory species are rigorously protected; the ranch has its own wardens. Ducks? Oh, some hundreds of thousands. Might a careful hunter shoot a few—in season? "Perhaps," with a wave of the hand. "Once in a while we allow a little shooting—in season."

There is a *patio,* of course, on which every room opens. There is a splashing fountain making murmuring music, and exotic flowers. The *patio* seems to be splashed with colors; otherwise it would be a place to retire for meditation. There is an interior stairway (here the architectural scheme departs radically from the traditional Mexican). It is wide, with dark shining banisters, leading on a grand sweeping curve to sleeping rooms; and above the sleeping rooms, a square and squat tower. The tower draws you impellingly, and you are told that in times of border banditry, indeed in the recent days of the war, it was an observatory equipped with field glasses and searchlight—for business purposes. If there *were* German spies in our midst, assuredly they did not overlook such an important food base as the King ranch. The twin cannon posted on the sloping lawn begin to acquire significance. A rattlesnake could not approach Santa Gertrudis headquarters without being seen.

A brief rest, then a ride over a bit of the ranch. Only a tiny bit, just a thirty-mile drive, every foot of it King property. Mr. Kleberg casually remarks that six hundred miles of barbed-wire fence was required to inclose the ranch. He cannot offhand state the exact acreage under fence (grimly refers you to the tax collector), but the upper ranch runs sixty miles east and west by thirty miles north and south, and the lower ranch about the same.

The King ranch lies in seven Texas counties, and occupies seventy-five miles of coast line. The guest can depart from the ranch house in one of Mr. Kleberg's thirty automobiles, and, without leaving the property, drive plump into the Gulf of Mexico. His drive will be over a continuous bed of flowers, calling attention to which Mr. Kleberg will observe that "our stock sleep on a 'flow'ry bed of ease.'" If the start is made from the lower ranch there is not a creek to cross, and not a bridge. No river traverses it. It seldom rains. Yet there are fields of cotton and forage grasses. That brings up the question of water.

Deep wells, Mr. Kleberg explains, could not exist without sub-surface water. Early settlers in the country drilled into salt water, and quit. The head of the King ranch went deeper until he found an exhaustless flow of artesian water. He has never drilled a dry hole. With this supply, banked in a series of great earthen reservoirs, the stock are watered, the numerous farms within the ranch—self-functioning units—are irrigated, and citrus fruits and Australian eucalyptus trees are cultivated. There are thirty ranch houses for pasture foremen and their families, and each has its grove of bearing orange and lemon trees.

The ranch master described the drought of 1893: the cattle wandering over the prairie perishing, how "their lowing wrung my heart," and how, when the collapse of the whole enterprise seemed near, the first water well gushed over the top of the derrick.

"It flowed 200 gallons a minute," he said. "Every drop meant life. I just went over to a tree and cried. It meant a lot. It meant that we would hear the whistle of the locomotive. It meant cotton and forage crops, and a cotton mill, and a town, and good schools. They have all come. We have had the railroad since 1904. We have 10 000 acres planted in cotton and forage, and 2,000 acres in Rhodes grass. The cotton mill offers steady employment. We made a town at Kingsville. There are four schools on the place; our Mexican children are getting an education. Large parcels of fertile land have been cut into farms and sold on easy terms. The country is settling. Progress has come to us down here and we have gone out to meet it."

"Captain King would not know his place if he returned," I ventured.

"The only object he would recognize would be his wife," Mr. Kleberg answered. "Captain King thought ahead of his time, but even in his day the cattle business, and especially down here, was more of a haphazard and precarious occupation from day to day than a stable industry. Before the packers and railroads came cattle were driven far distances, to Kansas and Missouri and Illinois, in search of markets, usually in small bunches. The packers brought us cold storage houses and refrigerator cars. What was more to the point to the cowman, they brought a market to his doors."

"What was the beginning of pure-blood breeding?"

"The fencing of the range saw the beginning of the movement to improve the blood of the herds. When I assumed the management of the Santa Gertrudis Ranch I realized that the old-time scrubby longhorn cow must go. I brought in the shorthorn, and the white face, and bred them extensively. In later years we have experi-

(*Concluded on page 15*)

Dynamiters' Intensive Stock-Selling Methods

How Shock Troops of Doubtful Security Campaigns Are Trained

By JOHN M. ROBERTSON

WHENCE do the high-pressure, one-call stock salesmen, the shock troops of doubtful security sales campaigns, come? How are they recruited and drilled?

These questions have arisen from the publication of the recent article about Securities Commissioner Beck, of Ohio, driving from that state in the last eighteen months practically all of the ten thousand dubious salesmen who operate in that state.

The high-pressure stock salesman's importance inheres in the essential part he takes in the quick marketing of large issues of promotion securities.

Chicago is the metropolis of this class and of the promoters who train and employ them. The rendezvous of principals and agents in the traffic is a flashy loop district hotel.

High-pressure selling talent gravitates to Chicago after the conclusion of field engagements for two reasons: Salesmen are more certain of obtaining another job in Chicago than anywhere else and, also, promoters there follow the amiable custom of advancing known producers funds with which to keep body and soul together while waiting for something to turn up.

The successful "dynamiter," as these salesmen have come to be termed, can earn from two hundred to a thousand dollars a week when handling a good selling issue of stock, but being free-and-easy spenders they often need financial assistance between engagements.

Several months ago an American promoter was engaged to market several million dollars of stocks for a Canadian undertaking. Through the Chicago plan he was able almost instantly to dispatch one hundred and fifty dynamiters to the unfortunate community selected to hold the bag.

High-pressure salesmen under such conditions are always sent out into the field with a one-way ticket and no expense money. They have to produce instantly if they are to live. Captain John Smith's idea of permitting only those Virginians who worked to eat is applied with a vengeance, and sometimes with interesting results.

There is the case of a Chicago dynamiter who was shipped into Western Ontario by his American chief. He was then given a one-way trolley ticket to a village. He entered his field penniless, but with the dauntless spirit of his kind. However, the community had been combed by several other high-pressure workers and terrific sales resistance was encountered.

When "Opportunity" Knocked

THIS salesman was peddling stock in a marketing concern that proposed to take all its farmer members' production at a premium above the general market. Needless to say, the only beneficiaries of this scheme were the promoters and their salesmen.

Our salesman canvassed all day without closing anyone. About nine o'clock at night he knocked at the door of a farmhouse. It required quite a racket to awaken the householder who finally thrust his head out of an upstairs window and inquired who was without. True to his school of salesmanship, the dynamiter replied: "I am opportunity."

The unsuspecting farmer put his caller up for the night and in the morning he listened too long to the canvass that was given him with zeal plus desperation. The farmer consented to sign a note for a number of shares, but had no cash with which to make the twenty-five per cent down payment. Incidentally, the down payment never reaches the treasury of the issuing company. The salesmen and their employing promoters are always taken care of first.

The salesman was puzzled; he had to have some cash on which to exist while outwitting other subjects of King George. Finally, as a gesture of accommodation, he accepted the worst span of horses the farmer had in lieu of money and rode into town on one of the nags, leading the other. He sold the steeds to the first horse trader he met and then stopped worrying about expense money. He was living off the country.

How Salesmen Are Trained

HIGH-PRESSURE stock salesmen are recruited through classes in inspirational selling conducted by those who organize big campaigns, and many of the salesmen thus produced are Jews. The latter are especially useful in foraging among the foreign colonies.

The training in inspirational selling which produces the high-pressure one-call talent is a blend of the most quickly productive elements of pre-war campaigns for public buildings and kindred purposes, of certain strong-arm tactics perfected during war drives and, lastly, of intensive specialty selling methods. Every quick selling and closing plan that has a "kick" in it is drawn upon by the faculties of these "schools."

The stock-selling outfit that desires to recruit sales material through this channel advertises for students, offering a free course under a highly touted "sales authority." The tremendous potential earnings are stressed in the advertising which leading newspapers are always willing to carry.

The students are placed under the spell of the chief lecturer and his aides, who first sell these credulous souls the promoter's organization and its present proposition and then convert them into zealots. The more destitute of culture and finance the students are, the better. They don't hesitate about anything they are instructed to say and do.

All the arts of the mob leader are used upon these newcomers. Old war-period songs are revamped to laud the selling organization, its boss and the proposition that is to be marketed. Former song leaders in great war drives are paid high salaries to get these enthusiasts so intoxicated with the spirit of the thing that they abandon restraint and discretion once they get into the field.

The supreme object of the training is to fit the graduates to sell their prospects on the first call. Toward the end of the course when the best material has been selected and the rest weeded out, the class is given a tryout in the field. Money and jewelry prizes and banquets, where much apple sauce is dispensed by the principals, make the outlook seem rosy to the newcomers.

Women are said to respond more completely to inspirational selling school methods than men. They are said often to become veritable magicians, beating down the resistance of their prospects with an ardor that mere man cannot equal.

After his second or third high-pressure campaign our inspirational salesman is usually disillusioned and fairly launched upon the primrose path. He soon becomes a hardened dynamiter clamoring for opportunities to gather in the commissions. Six or seven years is the average term that elapses before the inspirational salesmen and dynamiter becomes burned out and eliminated from the whole field.

There are other significant aspects of the present hectic marketing of more or less good securities to people who are in the main utterly incapable of evaluating them.

Utilizing High-Pressure Methods

THE wealth of the United States is estimated to have increased from one hundred and twenty-five billion to three hundred and twenty-five billion during the last fifteen years.

The annual surplus this enormous national increment has put in the hands of the more fortunate classes of our population has given the high-grade brokers dealing in gilt-edge securities such a volume of business they have in many instances become stall fed.

There are sufficient customers for all the tax-exempt and otherwise attractive and safe investments these houses have to offer, and it is unnecessary for them to deal in the marketing of less seasoned securities or the issues of new companies.

One such broker says that the able, industrious men in his line accumulate fortunes so quickly they never have to exert their full powers once they have got into the current.

It has been suggested that one of the next steps in finance should be that honest men of vision and discriminating ability pre-empt the high-pressure field, discard the bad features and utilize the germ of productivity and service it indubitably possesses. Modern industry in many lines employs intensively schooled salesmen who are ethical and useful in quickly introducing things that make for better living. Their quick methods actually reduce the cost of an article, and the cost of selling is an important element in every price.

This suggestion is borne out by the record of a man who formerly conducted welfare organization building campaigns. He was unwilling to return to this field after leading various war drives. He is now financing local hotel companies, using legitimately many of the expedients that high-pressure stock people employ illegitimately.

A compelling reason for many new industrialists employing unscrupulous high-pressure stock-selling campaign promoters is the Federal tax laws which penalize investments by people of means. These laws have diverted surplus funds into tax-exempt bonds.

Formerly the well-to-do business men often joined in financing new or reorganized concerns. These same people now find that if they put their surplus funds into a new venture and it turns out as well as they have a right to hope, their total taxable income may be so swelled that the surtaxes will reduce it lower than if they had done nothing at all, and in the meantime they have risked losing their investment.

This condition has at the same time deprived the new commercial and industrial operators who need capital of the co-operation of big-caliber men who would join their directorates if they made substantial investments.

Country Needs Penal Laws

MANY enterprising men who are endeavoring to develop valuable new processes or products are forced in desperation to turn to the high-binder organizations that have been mentioned. These involuntary clients must pay heavy underwriting discounts, give stock bonuses and promise investors unreasonable dividends at the outset. This heroic treatment usually kills the patient.

In a large western center a hustling man with a clean record has had to import what he terms thirty "taxicab drivers" to place the stock of a new industry which he will, in all probability, operate in a creditable fashion.

Because of Federal taxation, the normal local investment machinery no longer functions for the use of such an able citizen. He says his only alternative to hiring his own crew of dynamiters was to accept offers of New York curb brokers to take his stock at seventy per cent of par. They would then ride it up on their markets until they could dump it on the public at say one hundred and fifty per cent of par. Then it would be allowed to sag to a nominal price until the industry had established a dividend record, a matter of several years at least.

Since such procedure would discredit the company if it sought additional financing in respectable quarters, the dynamite method was selected as the lesser evil.

The country needs rigidly enforced penal laws and bonding requirements that will eliminate the reckless dynamiter and the dishonest promoter who puts him into the field. It equally requires more certain detection and punishment of the fake business concerns that conspire with these selling agencies to place worthless stocks.

However, the nation needs no less badly, if new businesses are to be established by new, worth-while men, Federal taxation measures that will not penalize enterprise and make impossible the normal opportunity sought by the small investor.

The Evolution of Art

THE evolution of art is not, as might be supposed, coincident with the advance of the human race. The Egyptians were erecting magnificent temples and palaces, carving sphinxes and covering the walls of their buildings with brilliant examples of decorative art long before Moses led the Israelites across the Red Sea, and the ancient peoples of Mexico were constructing massive monuments of architecture covered with ornate embellishment while the northern tribes of the Eastern Hemisphere were painting their bodies with the juices of plants, and living in caves and rude huts made of mud and wattles.

The growth of the fine arts of the Old World can be readily traced from the ancient remains which have been disclosed from time to time, and the splendid specimens which have come down to us and are now preserved in art galleries and museums.

To the Egyptians the arch was unknown. This accounts for the massive monoliths they employed horizontally, supported by columns of colossal proportions. The amount of material they used, in proportion to the accommodation provided, was very great, and the great wall surfaces were lavishly decorated with paintings in the most brilliant colors, some of which remain as full of luster today as when they were put on. Sacrificial scenes and royal processions were favorite subjects, and the winged globe, the lotus flower, and the papyrus plant were favorite symbols in the scheme of decoration. The Egyptians did very little carving on their wall surfaces, but this was taken up by the Persians and Assyrians who borrowed their designs from the Egyptians and reproduced them in stone.

The ruins of Persepolis and Nineveh furnish numerous examples of the high standard to which this Eastern art attained, and when the conquering Alexander came with his armies, he failed not to carry off art treasures from this part of the then known world and induce the artists of Greece to imitate them and develop them. The spiral or volute, which is one of the most beautiful features of the Greek Ionic style of architecture, is perfected from the Persian and Assyrian capitals of the same nature. In the field of art and architecture the ancient Greeks rendered more beautiful every idea that they borrowed, giving it new life and significance. The work of their sculptors—as witness the frieze of the Parthenon at Athens—has, throughout the centuries, served as models to those who followed, and their mural paintings had a refinement and beauty that moderns are still trying to imitate.

But the day of Roman power and influence came, and with it a desire to emulate the Greeks in everything pertaining to the fine arts. Grecian architects and sculptors were brought to Rome by the conquering emperors, and palaces, triumphal arches and temples arose which outshone in their splendor anything that had gone before. In the love of display that at a later period overtook the Romans, they departed from the chaste beauty of outline and form which they had learned from the Greeks, and when the seat of the Western Empire was fixed at Constantinople there was evolved from the five orders of architecture peculiar to Rome that more ornate and much less beautiful style called the Byzantine, of which the converted mosque of St. Sophia at Constantinople is a good specimen.

Modifications of this Byzantine or Romanesque style spread over Europe and gradually developed into what became known as the Gothic style, which is essentially Eastern in its origin, although its conception is not due to the Byzantine influences alone, but to the splendid architecture of the Moorish conquerors of Spain, from which it undoubtedly got the idea of the pointed arch.

Then came the great European revival of art in the fourteenth century known as the Renaissance. This was mainly due to the advent of the Turk in Europe and the conquest of Constantinople. Architects, painters and sculptors fled to the West, and Rome again became the art center of the world. But Florence, the home of Dante and Giotto, and later of Raphael, had already attained fame by the work of its writers, its artists, and its handicraftsmen.

The building of St. Peter's at Rome gave the opportunity that was wanted as an outlet for the talents of the sculptors and painters of the Renaissance period. Here Michelangelo and his younger craftsman Raphael carried out those magnificent works which are yet the admiration of the world.

Then there was the Spanish school which produced a Velasques and a Murillo, and the Dutch and Flemish schools, with the Van Eycks, Rembrandt, Peter Paul Rubens, Teniers and Van Dyck. So it continued until modern ideals were adopted.

Canada Extends Royal Welcome to Immigrants

Her Ellis Island Resembles the Reception Room of Princes

By E. L. CHICANOT

CANADA is always aware when it is open season for immigrants in the United States. Canada always knows about it because every day the heartrending particulars of some harrowing episode are telegraphed to Canadian newspapers.

Whatever be the truth of it all (many otherwise quite intelligent people regard these accounts as truth because they are newspaper stories) the impression is created in the Canadian mind that Ellis Island is a particularly hideous form of confinement and torture to which immigrants voluntarily subject themselves, much as the early Christians did, in expectation of a commensurate reward. In his comparative viewpoint the Canadian looks upon the operation of Ellis Island as a sort of Spanish Inquisition conducted in a black hole of Calcutta and marvels that the United States can be so callous and yet have more and more immigrants continuously coming up for punishment. To anyone familiar with the processes of Canadian immigration it is astonishing that any nation, no matter how great, can get away with it. In Canada a cross look to a newcomer is regarded as rankly unpatriotic.

Canada spends a great deal of money in advertising and other ways to secure immigrants and once they have been prevailed upon to embark and have set foot upon Canadian soil it becomes her doubly difficult task to hold them. The immigrant is her hope of future nationhood and consequently her Ellis Island is more like the reception room of a royal prince just coming into his kingdom.

Above—Mr. George Robb, of Auchtermuchty, with his wife and six children, photographed on board the Canadian Pacific liner *Metagama* at Glasgow en route for Canada. This family party is proceeding to Braeside, Saskatchewan.

Some of the party of domestics who sailed for Canada on Friday, March 21—photographed on board the Canadian Pacific liner *Metagama*.

Below—Two boys and a buoy.

Owing to the fact that the St. Lawrence freezes up solidly for several months of the year, Canada's Ellis Island is divided into two parts, or rather there are two complete Ellis Islands. That for winter use is at St. John, New Brunswick, and that for the summer at Quebec. This situation results in the necessity of maintaining two complete sets of immigration buildings and the seasonal transfer of all immigration machinery, including government officials, steamship and railroad staffs, and the various altruistic camp followers bent on completing the newcomer's assurance of welcome. All connected with port immigration affairs—and they constitute a goodly army — possess two homes or none at all, being merely seasonal campers. This makes their uniformly urban attitude toward their work the more remarkable. In the fiscal year 1923-24 Canada received 148,560 immigrants, an increase of 104 per cent over the previous year. British immigration increased in the year by 104 per cent, and Continental by 237 per cent. It is very clear that the period of post-war depression is passed, that the Dominion is benefiting to some extent from the United States quota law, and that altogether a new era has dawned for Canadian transatlantic immigration.

St. John concluded the busiest season in the movement of people it has experienced since the war and at the present time a hectic activity prevails at Quebec. People from all parts of Europe are coming in large numbers and Canada hopes to hold them permanently. With all this great anxiety to secure immigrants and exceeding joy when they are gathered into the fold, it must not be imagined that Canada does not take certain precautions against her future at the hands of these people. Nor is she governed by sportive instincts to give preference to those who can fight their way to the front or who travel on boats which cover the ocean more speedily. Restrictions of various orders have been in force since the conclusion of the war, and even now, when what is considered an open door prevails, health, morality and a reasonable assurance against unemployment and becoming a public charge are necessary qualifications. The investigation and examination is throughout very thorough but is conducted in such a way that so far from resenting it the immigrant is rather inclined to congratulate himself on his good fortune in being chosen for admission to such a select country. The entire treatment which features his admission supports this.

An immigrant is practically assured of entry before he arrives. The examination of really outstanding importance, which is the medical, is performed on European soil before the immigrant embarks for America and he is subjected to another on board the vessel by the ship's doctor who makes his report to the immigration officer. The final medical examination is very brief and the percentage of rejections is remarkably low. Those unfortunates who have contracted diseases on the voyage, and have been detected by the ship's doctor, never leave the ship, and are transported both ways at the expense of the steamship company. Where a steamship company has brought out an immigrant who, in the first place, should have been refused on medical grounds, it is subject to a fine by the government.

The examination room is arranged for expedition and to subject the immigrant to the least possible delay and discomfort. He enters the room at one end and in the space of a few minutes is at the other end an accepted citizen of Canada. Several long, wire-inclosed passageways run the length of the hall and the immigrants file past the inspectors. The examinations, medical and civil, occupy merely about one minute each, and about three hundred and seventy-five immigrants can be handled in the course of an hour. Having reached the other end of the room all worry about his getting into Canada ceases and the immigrant has but to make his preparations to reach the particular part of the Dominion he has decided shall have the benefit of his presence. He descends to the waiting room below.

The next thing is to make provision for the railway journey, rather an awing experience to the immigrant with the formidable yards of ticket instead of the familiar square inch of pasteboard. Booths of the different railways are located in the same room and, furnished with their tickets, the travelers pass on to another part of the same building where the baggage from the steamer's hold has been arranged under initial letters so that it is located without any difficulty. There are numerous customs officers, to each of whom is attached a

(*Concluded on page 10*)

Future Canadian citizens being taken care of in the ship's nursery, en route to the land of promise.

Mr. Ford's Page

EVERYTHING about life seems to be imperfect, save life itself. When we busy our minds with the spectacle of mankind as it makes its progress through colossal blunders, we wonder why human society did not become bankrupt and extinct ages ago. Everything for which it has depended on itself has been grotesquely done, has been filled with moral, economic and physical imperfection; the law of deterioration has been most evident; and yet society has survived. The answer, of course, is life. You cannot hold back life. It pushes up through every system. It adapts itself to every circumstance. It is a river, the streams whereof cannot be holden.

The story of the persistence of life is History. That is why the thing we call History is not that. We think, for example, that the recent political convention made history; indeed, wise men are already saying so. The fact is to be stated in just the opposite way: it was the pressure of life that made the convention. And perhaps it may be true that life made something more important than the convention, because it may have sought a channel there and, being refused, may have left the convention high and dry.

We say that there are two tempers in the world directing the progress of things. We call these tempers Conservatism and Radicalism, if we are in a balanced judicial mood; though we name them Reactionism and Anarchy when we happen to be speaking in the partisan spirit of opposition. Whatever their names, we must correct the opinion that either of these tempers ever directs life; it is life that calls upon the one or the other as it may need them. It is not the weather vane which points out to the winds the path they shall take; it is the winds that indicate on the vane the way they are going.

It is so with parties and social tempers. The shuttle of life moves back and forth; the pendulum of destiny swings right and swings left; but neither the shuttle nor the pendulum is primary; there is something behind and beneath them. So, in a period when radicalism seems to come to the fore, the event is hailed by shortsighted men as indicating a victory of radicalism over conservatism. And when, as at the present time, conservatism seems to be moving up to the helm again, little minds hail it as a victory over radicalism. What either movement means is that life, which at one pole is conservative and at the other progressive, is using now this element and now that for its purpose. Neither conquers; each falls into step as life orders.

THE trend, not only of politics but of life in general, is strongly toward conservatism. The term, like its opposite, has been long used to indicate something that it was not. But as a climate of the mind, a deposit of experience, a mark of sober wisdom, conservatism has a very large place even in the midst of radicalism. The progressive spirit of life is always getting what it wants, and it is always tucking its gains into the safekeeping of conservatism. Our conservative nature digests and makes our own what our radical nature has conquered. But neither conservatism nor radicalism is supreme, one never vanquishes the other; both are hands used by Life. Life uses radicalism now for a little; and now it uses conservatism for a little. Between them they measure the course of the weaver's shuttle, the great weaver, Destiny.

The origin of parties is not in political problems but in human temperament. Perhaps temperament is not the best word, maybe it is not the most inclusive explanation, but it belongs somewhere in the summing up. There are born conservatives and born radicals. Of two famous brothers in this country, one became the staunchest defender of orthodox religion, the other went farthest afield in liberal religion, and one could no more be the other than he could change the color of his skin. Temperament. Two great armies, one striking out in all directions, a great scouting column feeling out all sorts of future follies and wisdom; the other taking care of the lines of communication, and keeping supper ready for the home-returning scouts.

Sometimes to temperament we must add age. If all the men who have been radical in their youth had retained their radical connections, the world would be overwhelmed with radicalism today. But years usually bring balance. A young man soon learns that radicalism must be brought down to earth, that you can't raise livings by making mystic passes with the hands or repeating socialistic creeds. The young man marries, becomes an ancestor, gets a view of the continuity of the generations, stakes out a claim in the earth, and gradually begins to sense the relation of cause to effect. He may remain a radical in principle, but he becomes conservative in action. Hence the saying, "Old men for counsel, young men for war." It's a saying which is not in very good repute these days, but it contains a principle.

Conservatism undergoes the same kind of change. We are not speaking now of the conservatism which would be more accurately named selfishness, nor of the radicalism which should be called jealous destructionism. These things are abhorrent both to real conservatives and radicals. What we mean by conservatism is the temper in which sober caution is predominant. What we mean by radicalism is the temper in which enthusiastic social and moral adventurousness is predominant. The radicalism or conservatism which undergoes a change is that which is born of low emotions of personal antagonism. It is appalling how some classes of men hate other classes of men; how some monied men hate working men, how some working men hate men of means. It need only be said that both these classes exclude themselves from the world's work by their very hatred. They are only among the minor issues with which true conservatism and true radicalism have to deal. They are not forces at all, but fevers.

The balance—contrary to what the orators say—is always in favor of conservatism. Go into the most wild-eyed radical group; the manager of it is always a conservative-minded person. The wild-eyed ones may do the shouting, but the other gives the orders. Just as the old-time saloon-keeper insisted on sober bartenders, so do radical groups insist that their leaders be long-headed conservatives. All the great causes go forward by conservatives. Abolitionists were a hot-headed group; but it was under Lincoln, who was not an abolitionist, that slavery passed away. For seventy-five years the zealots of temperance flamed through the land; but prohibition was finally put over by masses of people who never attended a temperance lecture. The great so-called radical departures that go over and stay over are put over by conservatives. Since conservatives have come to the front in Russia, the radicals are getting bread every day.

These are specimens of the facts which must be understood if the return of our people to public support of the conservative type of mind is to be understood. The most progressive nation in the world has never elected a professional radical, and never will. It has elected men like Roosevelt, for example, who talked in a way to please the radicals, but whose administration was always marked by a true conservatism. Andrew Jackson was not a radical, but a conservative, and he was against a class of conservatives so radical that they imagined they could make the United States an adjunct of a private banking system. All the way down, from Washington to Coolidge, whether Republican or Democrat, the conservative type is the type in which our people have put their faith. That is a tremendous score in favor of the statement that the balance always turns toward conservatism.

It remains for a future page to make clear just what kind of conservatism has come to the country today. To clinch the case for the predominance of the appeal of true conservatism, however, it is only necessary to observe that all men become conservative when they get what they want. Bismarck was execrated by European radicals for half a century because he suppressed one newspaper; when these same radicals came into power they suppressed five hundred. That simply shows human nature. But when men's just rights in opportunity and reward are recognized, this recognition and justice bring social peace and stability—the fruits of a wise conservatism. So well do revolutionists understand this that they counsel an insane spirit of destructive dissatisfaction even when all social claims are met. The fact that there is so immediate a bond between justice and conservatism, one as cause the other as effect, is no small matter.

A volume of 452 pages, durably bound, containing 98 of these articles under the title of "Ford Ideals," will be sent postpaid for $1.00.

It Came—To Pass

THE most colorless Republican Convention ever held, the least profitable to the national mind, the most provocative of criticism of the whole convention system even among the upholders of that system, has taken its place in the list of things that have come to pass. It was unmarked by a single notable speech, a single ringing ideal, a single recognition of the basic ills and basic needs of the nation. There was not a single contribution to practical politics, nor the most distant glimmer of political science.

Only once was there promise of life being injected into the mass, and that was when the Wisconsin men menaced the proceedings with the threat of an Idea. But that hope failed; the LaFollette men played even smaller politics than did the regulars. The Wisconsin men dealt in peanuts and spent their force in plastering puerile personalities with piffling praise. The ideas of Senator LaFollette deserved better presentation than that. The country deserved better than that from the pretended devotees of national righteousness. The party deserved better than that from men who verbally espoused the purification of politics. It was not the strength of regular reactionism, but the utter weakness of Wisconsin progressivism which accounts for the failure of the Convention's one opportunity to rise above mediocrity. The only character the Convention attained was the substitution of courtesy for steam-roller methods in the treatment of insurgency or progressivism; and politeness on that score was easily possible and perfectly harmless, because of insurgency's total lack of moral force.

The Platform which was adopted is a relic of dead things that once had a meaning. It might have been written by any party any time within the last fifty years. It deals entirely in superficial matters, assumes that everything must be right when the Republican party has control, shamelessly attributes to Republican wisdom changes that occurred when no party or statesman had a least lucid thought as to what should best be done; in brief, it is a platform which was made to be as nearly without length, breadth, depth, corners or substance as it was possible to achieve. It is neither a program of action nor a statement of fundamental principles, and not the most addled partisan would consider it a bid for votes. It belies its very name, and its sole function seems to have been the fulfilling of another ceremonial requirement of Convention.

The Ticket is, of course, what it was foreknown to be—Calvin Coolidge. Politicians within the Republican party had not intended it so ten months ago, but so it is. To state the verities of the situation, the Convention was Coolidge and the Platform is Coolidge. It is certain the campaign will be Coolidge. Coolidge is a big enough factor to shut out the embarrassing fact of Washington investigations and the nauseating blatancy of a meaningless Platform. The party and the politicians may well thank heaven for Coolidge; without him, the June convention skies would have been cloudy enough.

Never was the Vice-Presidency more unanimously refused by more men, and perhaps never was the country better served by such refusals. The real depths to which organized politics have fallen may be gauged by looking over the list of candidates proposed for the secondary office. From this remark Senator Borah may be excepted. Some of them would have been a distinct liability, others would have been mere nonentities; whether the final choice will be an asset remains to be seen. The banker with a military title does not exactly represent the plain people of the country.

The country will frankly recognize the fact that Conservatism is in the saddle. Coolidge is conservative; Dawes is conservative; the organization which Coolidge has gathered round him is conservative.

Once upon a time that would have been a damning thing to say. But Coolidge conservatism is a type that rises above partisan and class interests. The most radical thinker wants a conservative manager of his affairs. Coolidge is that kind of manager. The country is full of radically progressive talk, but it is more at home on the hustings than at the administrative desk. We learned long ago that our best speechmakers were our worst working officials, and that our most lavish promisers were our poorest performers.

Conservatism at this hour means the sober application of knowledge and experience to public problems from the standpoint of public service. It used to mean the application of public power for private or class benefit. The same principles of service which have been observed in behalf of privilege can be just as well observed in behalf of all the people. There is a type of mind which conserves, manages well, makes ends meet, administers and develops. It is only wisdom to enlist this type of mind in the service of the nation. In the past it has erred through having a wrong motive. Now it has a new motive. It has become enlightened and has acquired a strong sense of social responsibility—that is, it has in such men as Calvin Coolidge. It is the New Conservatism, and it seems to be having a chance to show what it can do for the nation as a whole. Coolidge is not the nominee of the Republican Convention alone. He is the nominee of the people.

Signor Nitti Says

OF ALL the European nations only Norway and Sweden are honestly keen on peace, according to former Premier Nitti, of Italy, who has gone into voluntary exile to escape the persecutions and annoyances of Mussolini and the Fascisti. "The big Powers are drifting toward war unless they change their policy soon," he declares.

The value of any opinion by Signor Nitti may be gauged by his statement that the United States is showing a more sincere attitude toward peace than formerly!—and he hopes before long to go to the United States and appeal to the people of the country for their help against future war. What does he mean—"than formerly"? Is it possible for any man to impugn the American attitude toward peace at any time?

Recent American observers abroad have reported an absolute desire for peace among the people of every nation, but this is combined with a situation which renders war almost certain. They disagree with Signor Nitti on all important points. While America would cordially receive the former premier of Italy, it may be courteously suggested that peace propaganda is best disseminated where all the wars are made—and that is not in the United States of America.

They Are Through!

WELL, the commencement orators are through, and the world is as ignorant as ever. The liberals have yelled for academic liberty (although they are the only one who have it!); the idealists have denounced our materialism (in buildings made of the finest materials, to which they rode in motor cars the products of "materialistic industry"); pacifists have demanded that the United States wipe its hands which drip with blood and stop the horrific work of stuffing young men into cannon's mouth (although this is the only nation that doesn't do it, and nearly the only one pacific enough to endure the pacifist); the Fundamentalist has insisted on his tenets without the suavity or the learning of the Modernist, and the Modernist has had his cultured sneer at the Fundamentalist without any of the latter's martyr-like sincerity; old orators have counseled caution, and young orators have counseled iconoclasm; normal men have said that the best way through life is to find one's work and do it, find one's faith and live it, find one's soul and mold it; psychopathological literary "artists" have yowled about Youth and Sex and "living your life according to your own ideas"; feminists have proclaimed the Coming Age of Women. A babel of voices has been raised on every conceivable theme from every conceivable angle, and the Next Generation has listened courteously—it was the necessary prelude to receiving a diploma and release.

Perhaps by now we know the secret reason for the destruction of Alexandria's library; it was filled with Commencement Orations.

Laying One Brick Instead of Two

WHAT has come to be known as the "Ca' canny" policy of the British Labor men is turning out to be one of those "chickens that come home to roost," as far as the new housing scheme of the Labor Government is concerned. The report of the National House Building Committee embodies the "Ca' canny" policy in its conclusions, and the cost of building is based on the assumption that a bricklayer will lay only 300 bricks a day, whereas before the war 600 bricks a day was considered a very easy minimum.

The policy of under-production—the laying of one brick where two could be laid—has taken a powerful hold of labor leaders not only in Britain but in other countries of Europe, and it is largely responsible for the deplorable amount of unemployment that exists in England and Scotland today. So high is the cost of building as compared with the pre-war period, that practically all speculative building has stopped. Hence the accentuation of the housing problem.

House building is no longer a sound investment, neither is the purchase of house property. People of moderate means, who would solve the housing problem by getting homes erected for themselves, are deterred by two things—the high cost of building, and the high taxes on property. The laying of one brick where two were formerly laid, and the driving of one nail where formerly two were driven, is to be blamed for this.

But the fallacy that there will be more jobs to go round if workmen pursue the "Ca' canny" idea has taken such a strong hold of British labor, that it is hard to eliminate. It has engendered an unwholesome state of mind that is responsible for much of the misery that prevails. It is the principal obstacle that faces the Ramsay MacDonald Government in its sincere efforts to find a solution for the housing problem. It is a policy which has been persistently preached by labor leaders who are now experiencing its poisonous effects. Until the British workman learns to give an honest day's work for an honest day's pay difficulty will be piled on difficulty, and walls of difficulty will continue to arise.

Reds Finance by Robbery

IN DEALING with the business of bank robbery, American police authorities may do well to consider the experience of Russia. Previous to the revolution in that country, *Red propaganda financed itself by robbery.* The party adopted a regular policy of what was called "expropriation," that is, they violently confiscated wealth for their political purpose. They did not call it robbery; it was war against society. Express trains were held up, government funds were stolen, banks were robbed, and when very rarely the robbers were captured the loot was never found. The most expert criminals in the world, most of whom are now officials of Soviet Russia, were engaged in this work of foraging on society *for the purpose of recruiting the revolutionary treasury.*

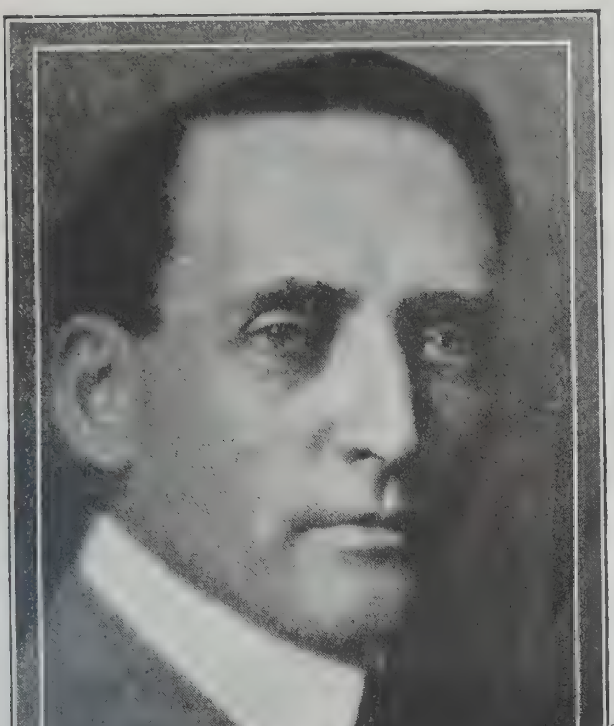
It must be admitted that robbery in the United States long ago passed the status of a "crime wave." It has attained the efficiency and regularity of an established business. Bank and train and government robberies are pulled off with a precision that bewilders the police. The police, following the old categories, assume that they are dealing with plain, everyday thieves, criminals who steal for themselves, and this assumption has left them up in the air. Millions of dollars are stolen outright, billions are obtained by swindling—and the police assume that it is all done by the type of thieves and confidence men who operated before this country was made a missionary diocese of the world revolution.

Perhaps it would be well to widen police perspective to include the possibility of this wide program of skillful robbery being part of the operations of the Treasury Department of the World Revolution. It is known, by bold and boastful confession of the present rulers of Russia, that this was the way they operated in that country. As most of the criminals now operating in the United States have close affiliations with the type that rules Russia, it is not unreasonable to suppose that the operation may have been transferred to this more fruitful land.

At any rate, there is a system, a foreknowledge, a practiced performance in the series of bank and train robberies in the United States that indicates a most highly organized element *continuously* at work. The old-time robber worked when he needed money. These new operators work all the time. Their work has all the earmarks of a program.

University Molds Men and Women for Its Own State

By HARRY H. DUNN



DR. ARTHUR GRISWOLD CRANE,

President of the University of Wyoming.

THE state universities in that part of the Union lying west of the Mississippi River have taken over the work of pioneering in higher education, first done east of that stream by the private and endowed institutions which in most cases preceded the state institutions. This condition is due largely to the fact that men of great wealth in the West fifty years ago did not seek to leave educational memorials to themselves, and to the further fact that men of wealth sufficient to endow colleges and universities were few in number in any state except the three bordering on the Pacific. The result is that the state universities from the Mississippi to the Pacific and from the Canadian border to the Mexican line have had thrust upon them the burden not only of giving general education to all the qualified boys and girls of their respective states, but of giving the great majority of these boys and girls their special education as well. This is true from the University of California, with its more than 10,000 young men and women on the campus, to the University of Nevada, with approximately 1,000 students.

One of these western universities, however, has gone a bit further along the line of specialization for the benefit of its own state, and probably is doing more to provide, for the future, men and women whose training has been with the particular view to preparing them for life in that state, than any other similar state institution in the country. This is the University of Wyoming, which, from an elevation of nearly a mile and a half, at Laramie, holds the educational range of this state of great distances and vast prospects, just as Laramie once mastered the range filled with Indians and buffalo and tremendous herds of cattle. It is one of the few really "free" state universities where the higher branches of education are provided at probably the lowest cost to the student of any similar institution in this country.

In the words of Dr. Arthur Griswold Crane, president of the University of Wyoming, this university "is a part of the free public educational system of the state; it aims to complete the general educational work begun in the primary schools and carried forward through the grammar and high schools in the various communities throughout the state. To do this, it is organized to offer work along the lines of study most in demand by the people of this state. While the underlying principles taught are not limited to the boundaries of any one state or nation, great stress is laid upon their application to the farms, ranches and homes of Wyoming. Especially is this true in our large and growing college of agriculture, one of the most important of the several colleges which go to make up this university. Our soil and climate cause many problems that are peculiar to this state. Not one of the states, not even those that border on Wyoming, has conditions closely identical with those of this state, and the same is true of social and economic conditions. Even the rules of cookery must be adjusted to suit our high altitude and arid atmosphere, and in household decoration, new combinations of line and color have to be made in this region of thin air, bright sunlight and great open spaces."

When Dr. Crane came, recently, to take the helm of this growing university, he was met some distance out of Laramie by a band of students, all dressed in the garb of the cowboys and cowgirls of the great ranges of twenty-five years ago, and by them transferred from his automobile into an old-time stagecoach, in which, surrounded by this mounted band of armed "terrors of the plains," he was hauled in state to the campus. Probably no other university president ever was given such a welcome, typical of a state which waited twenty-two years as a territory before statehood was conferred in 1890, and built such a university as this for its children in less than forty years.

Science Hall, University of Wyoming. This university pays especial attention to the practical results of scientific study. In its botanical department it has the largest collection of Rocky Mountain flora in the world, more than 100,000 specimens.

The history of the plan for a university in this state of the bison and the bald eagle, dates from the act of Congress passed February 18, 1881, entitled, "An Act to Grant Lands to Dakota, Montana, Arizona, Idaho and Wyoming for University Purposes," but it was not until 1886 that the governor of the then territory was authorized by the territorial legislature to appoint a commission to make the selection of 46,080 acres of government lands given to Wyoming by the national government as the foundation stone for its university. F. O. Sawin was appointed as this commission of one, and he selected 45,291 acres, which later was increased to 46,091.34 acres, the revenue from the leasing of which lands now furnishes some of the funds on which this university is operated. Action for the organization of the university was taken by the ninth territorial legislature in 1886, and the first session of the institution began in the autumn of 1887, in the Liberal Arts Building, which, begun in 1887, was not completed until statehood came three years later.

Under the state constitution, this university is to be forever "equally open to students of both sexes, irrespective of race or color." In addition to other income from its lands, from Federal aid, and from a small fraction of the state taxes, the University of Wyoming now receives nine per cent of all the moneys received as Federal oil royalties by the state. So well have these funds been administered for thirty-six years, that there are now seventeen buildings, valued at considerably more than two million dollars, not including the property on the experimental farms. The cost of an education here is probably the lowest of that of any state university in this country and plans have been completed, with the financing, for the expansion of the university to meet the demands of the young men and young women of Wyoming for the next twenty-five years. If the university's present share of the royalties on oil is undisturbed, it will have, within the next decade, one of the finest educational plants—from the point of view of material equipment—in America.

With all this advancement in a state where the population is less than two to the square mile, and where university graduates are confronted with engineering, irrigation and agricultural problems for hundreds of thousands of acres, tuition in all departments of the university is absolutely free. There is a matriculation fee of two dollars, paid only once during the student's entire stay at the university; an incidental fee of three dollars each term; a membership fee of four dollars a term for the Associated Students of the University of Wyoming, which has control over all student activities—and that is the end of the fees. Dormitories on the campus and under the supervision of the dean of women provide rooms for women students at rates from $1 to $3.25 a week. Growing out of the military program of the university during the World War, a commodious dining hall was erected, which is now known as the University Commons. It serves as a dining room for both men and women, and, since the object is not income but service at cost, students are given three meals a day at six dollars a week.

This is education in 1923 at the costs of 1900, and education especially selected and given with the end in

(*Concluded on page 14*)

At right—"Old Main," the first building erected on the campus of the University of Wyoming, in 1887, and still in use, though there are now sixteen other buildings on the campus.

The natural electric fan, visible from the campus, which keeps the University of Wyoming campus cool in the hottest summer. This photo was taken in July. The peak is 12,000 feet high and the lake 10,500 feet above sea level.

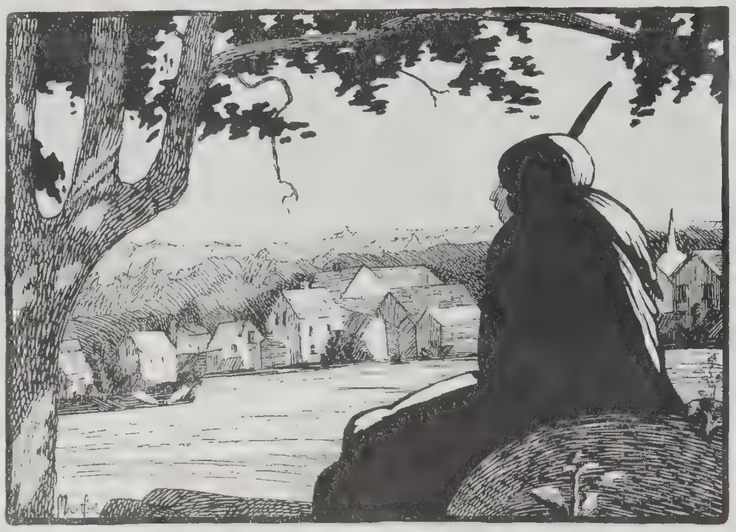
Damariscotta—The Lost City of Bashaba

Quaint Old Village Occupies Site of Place Which Made History

By MRS. E. L. MOUNTFORT

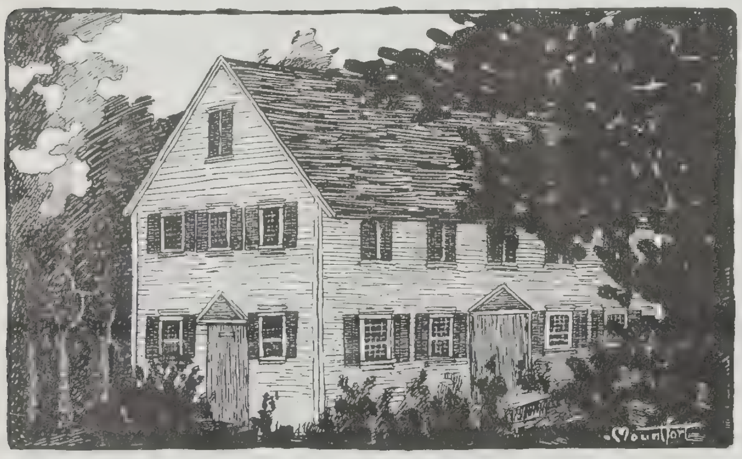


A prospect of the modern Damariscotta.

ON THE banks of the tide river, Damariscotta, which empties into one of the nicks in the serrated coast of Maine, there's a little village of just a few hundred souls, called by the same name, after Damarine, one-time Indian Sachem of Sagadahock (the English called him "Robin Hood"). The authentic history of Damariscotta dates back far enough, for the ancestors of some of these villagers, in 1622, gave of their surplus to Governor Winslow of Plymouth Plantation, when he came, in search of food to save his starving colonists, but ever the story persists of that lost city of Bashaba, chief of the Wawennocks, and some have placed it where this little village now is.

One, David Ingram, of some imagination, and searching adventure, shipped with a slave trader, John Hawkins, in 1568. They were attacked by Spaniards in the harbor of John d'Ulloa, and lost their vessels, but some ninety-six of them straggled ashore on the Gulf Coast, at about where Tampico, Mexico, is today. John Hawkins parceled out what remained of the ship's stores as best he could, giving to each man about five yards of cloth, but there was neither food nor firearms remaining. Only the most resourceful lived at all for very long, but of those who did survive, Ingram made his way, at last, after many privations and much suffering, up to Maine, to the land of the mighty Chief Bashaba of the Wawennocks, and to his capital, Arembec, the fabled lost city of Norumbega, on a mighty river, known then as the River of the Norumbega or Panawanskek.

Anyhow, Dave was an interesting story-teller, whether his hardships and privations getting there had affected his mind or not, for he credited the Indian kings with wearing rubies four inches by two, evidently a sort of talisman, for if dispossessed of them, it seemed, they shortly lost their kingdoms. He also said they were resplendent in gold and silver bracelets and strings of pearls.

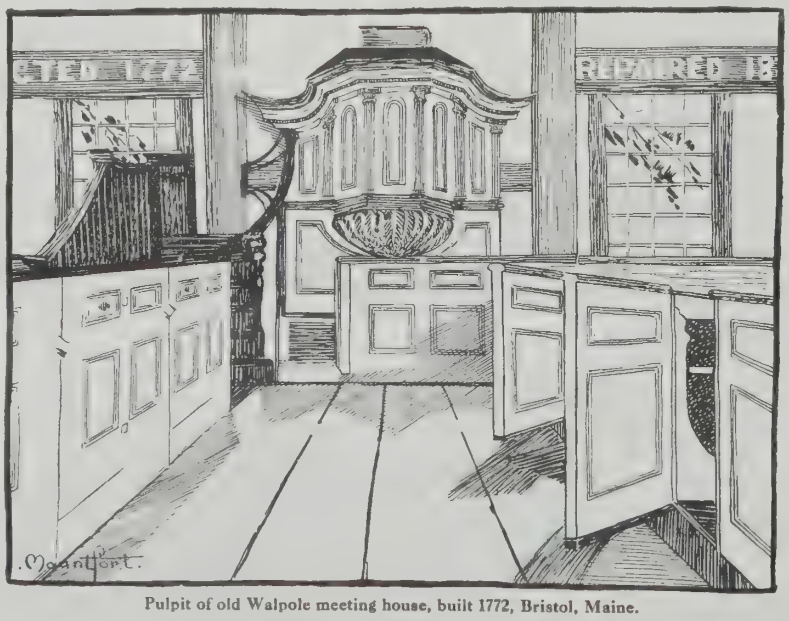


Old Walpole meeting house, built 1772. Shingles are the original ones.

Bashaba's palace (according to the tale) stood on twelve pillars of polished silver, the entrance being of crystal inlaid with precious stones. Everywhere were rugs of choicest furs. All the roofs were of silver or of copper and each house contained a bucket of real pearls sitting by the fireside. Bashaba gave to Ingram a house and a squaw in charge to cook his meals, 'tis said.

These tales of Ingram's induced the King of France to make Roberval the Lord of Norumbega, as well as the Viceroy of Canada.

Certain it is that, not very far above the present village of Damariscotta, on the river of the same name, are the much famed oyster shell mounds, relics of feasts of the long, long ago. One mound, 400 feet by 30 feet, is far the largest yet discovered anywhere. These shell mounds would seem to indicate a meeting place for powwows and attendant feasts, many of them, but their origin is so ancient that none of the Indians living at the time of their first discovery had any knowledge, not even hearsay, as to how they came to be there. Perhaps oysters abounded thereabouts in Bashaba's time, and maybe the river's course has since changed; certainly no live oysters are ever found thereabouts now.



Pulpit of old Walpole meeting house, built 1772, Bristol, Maine.

But, alas, to the east and north of the Wawennocks dwelt the Tarrantines, fiercely warlike. By treachery, at length, they secured an opportunity to surprise Chief Bashaba of the Wawennocks, sacked Arembec, his gorgeous capital, and made captives of his women, putting all his braves to death. Pestilence and desolation followed. No doubt Dave Ingram was safely back in Europe before this happened.

Somewhat southward of Damariscotta, Monseag and Sheepscot bays form a peninsula, on which is now the town of Woolwich. This was once bought from the Indians for a hogshead of corn and thirty pumpkins. Here James Phipps and his wife lived and raised their twenty-three boys and three girls. William, one of the youngest, was later royal governor of Massachusetts. Captain Phipps raised a Spanish ship at Hispaniola and brought it back to England with treasure to the amount of about $1,500,000 for which service he was knighted, the first American-born citizen to receive this honor.

It was Sagamore Samoset, of Pemaquid, who greeted, Governor Bradford on his arrival at Plymouth, with the words, "Welcome Englishmen," for Sir Ferdinando Gorges, at one time feudal lord of Maine, had sent Captain Thomas Derner to make peace with the Indians in 1619, and to restore Samoset to his Indian friends.

Records show that General Weymouth left Ratcliff, England, March 5, 1605, in the *Archangel*, under patronage of Lord Arundel. On May 17 he made a landing at a place which he called St. George, now known as Monhegan Island. On May 19 he entered Pentacost Harbor, now Boothbay Harbor, not far away from the village of Damariscotta. The versatile Captain John Smith, in 1614, attempted an attack off Monhegan Island, but later decided it was wiser to move on.

It is recorded that, on July 15, 1625, one John Brown, of New Harbor, some ten or fifteen miles to the south of Damariscotta, bought from Sagamores John Somerset and Unnogoit, all of the now towns of Bristol and Damariscotta, for the sum of fifty beaver skins.

Muscongus, or Loud's Island, a short distance down the coast, casts no vote nor does it pay any taxes. Its last vote was cast at the time of Lincoln's election—and was thrown out. Civil War times' necessity drafted nine out of the forty-five men on the island, which seemed to the islanders an injustice, and they refused to comply. A sheriff from the mainland, who stuttered, was sent to serve the papers. The wife of one of the men drafted was digging potatoes when the would-be process-server approached and stated his business. Furious, the lady started throwing potatoes at him, and so strong was her arm and so straight her aim that he immediately fled in confusion before her, telling his waiting friends on the mainland: "G-g-g-give her three b-b-b-b-b-b-b-b-bushels of potatoes and s-s-s-s-s-she'll take Richmond."

At first, in those earliest days, the pioneers had all that they could do just to clear ground sufficient to raise food enough for themselves and their families and for the beasts, besides building the houses and barns for shelter and cutting wood for fuel. They had also to raise sheep to provide wool, and this the women made into clothing.

But as soon as they had been here long enough to get a toe hold they saw the need of what would today be termed community interest. So, different householders along the Damariscotta River got their heads together and decided to build a church; but, they were shrewd old fellows, our forefathers, for they didn't just permit each man to give what he wished. No, indeed! Instead, a committee was chosen to levy upon each head of a family his proportionate share. This, however, did not have to be paid in money, for money was scarce then, and, strange to relate, it didn't mean so much at that; for one could neither eat nor wear it, and there were practically no stores! So the days' works were portioned out, as well as the materials required. Each window in the little church cost a cow—and there are thirty of them —quite a little drove! The old church still stands, just as it was built in 1772, with its huge wrought-iron hinges and hand-hammered nails, its hewn boards and hand-made shingles, though a few necessary repairs were made after it had been standing for a hundred years.

A tithing man with a long, long stick, took up his position in the rear, and woe betide any luckless individual who chanced to fall asleep, for the tither promptly rapped the nodding head smartly from the rear. Those sermons were all-day affairs. You took your luncheon with you in the morning and made a day of it. Likewise, you were supposed to be among those present unless you were really sick and could not go. But religion has languished, in Maine, as elsewhere, and now that old church is open only for services during August, when summer people, prompted by curiosity or otherwise, commune from the same silver service that was brought over from England before the Revolution.

They called it the Walpole Meeting House, a good old British name, and that county now bears a name as typically English—Bristol (incorporated June 18, 1765), though it was once a part of Pemaquid. This church was not denominational, and a preacher was secured, of whatever faith, as often as possible, and he was appreciated when they got him, too.

Some there be today, who sit in the same identical pews, in that old church, of a summer Sunday morning, that were first occupied by their ancestors when the church was built. And some of the deacons of today have had ancestor deacons ever since 'twas first decided to have a meeting house, in this, the first portion of New England to be settled by English-speaking people.

In 1620 there were 1,500 white people in Maine, and Pemaquid was then the busiest place on the coast, larger than Quebec, having eighty-four families or about five hundred souls.

The first Christmas observance recorded in New England, if not in the United States or even on the North American continent, occurred at the Isle of the Holy Cross, at the mouth of the St. Croix River, sixteen miles below Calais, by Frenchmen under De Monts and Champlain, in 1604. Champlain, at that time, suggested a canal across the Isthmus of Panama. St. Croix remained French until the cessation of Canada to the English in 1763.

Canada Extends Royal Welcome to Immigrants

Concluded from page 6

railway baggage man, and it is a matter of only a minute or two until the luggage is examined and checked and the immigrant's worry on this score ceases. It will be found on the platform at his destination.

There is only one thing more to be done before the arrival of the train and that is stock up with food for the journey. Formerly this was the only irritating feature of the immigration sheds. The store is operated by the government which sells everything to the immigrant at cost, and the immigrant who may have a large family and be traveling to the other end of the country is assured of good food for the entire journey at the lowest possible rates. The immigrant has been at the sheds scarce an hour and already he has been accepted for Canadian citizenship and is ready to proceed on his railway journey.

When the boat was yet coming up the river, special trains were pulling in at the triple track at the opposite side of the shed to the landing wharf, and as he stepped off the boat into the shed, so the immigrant steps out of the shed into the train. Altogether he is seldom more than from two to three hours at the terminals, and at the end of that time the special trains are speeding westward to distribute their human content into every part of the Dominion. Canada's Ellis Island is once more deserted and immediately makes preparations for the reception of the next immigrant boat.

This is Canada's Ellis Island. Trainloads of people from practically every country in Europe leave it every day, full of confidence and hope. Potentially they are good citizens already. The cause of any subsequent seepage must be sought in the economic conditions which lie beyond.

Political Zion Without the Rose-Colored Glasses

Not a Beautiful Romance But Something Very Different;

Jews Are Not Unanimous; Arabs Indignant

By C. R. ASHBEE

In an article in the English Review for February, C. R. Ashbee makes these observations under the title "Political Zionism Without the Rose-Colored Glasses."

MR. BENTWICH ends his article with the words "Out of the romance of Herzl's mind had come reality, and out of the reality of his work a beautiful romance had been created—the workings of which we see in Palestine today, twenty years after."

One who is familiar with this romance, who has watched closely its operations, may be pardoned for saying that it is a "beautiful romance" only to those who, like Mr. Bentwich and his friends, wear the rose-colored glasses, or are playing the leading rôles. To the vast majority of the population, or to the greater part of the Englishmen who are not Jews, it is not a beautiful romance at all but something very different.

When I quoted these words of the "Philo-Zionist" to a hard-worked official I got the reply, "Romance! Yes, if you call a Zionist Administration camouflaged as a British Mandate, Romance. I call it d..........d injustice." I do not share this view, but I propose to examine the reasons for this exceeding bitterness of the Arab and the Englishman, and to ask what is it lies at the root of the Zionist claim—what is it makes either side think as they do, the practical men on the one hand, and on the other the romanticists.

It is to be premised, however, that there are a few British officials—I have met some—who, so to speak, "go the whole hog" in political Zionism: they are those who believe in the direct fulfilment of the Prophetic Books, and who will quote to you the last five verses of the ninth chapter of Amos. Such men also are romanticists, but, though one may admire their enthusiasm and sympathize with their early biblical training, one does not go to them for a balanced judgment on a complex racial and political problem such as has been created in Palestine by the Balfour Declaration. Mr. Herbert Bentwich, indeed, tells us of those Evangelical Christians who rallied to Herzl's support, but he appears insufficiently to realize that they are not the force they were fifty years ago. . . .

Preferential Treatment

BUT there is a straight issue, a question of right and wrong, with which the Christian who champions the Zionist cause in Palestine is faced. It is this. The Jews may or may not return to Palestine, they may or may not succeed in establishing their purely Jewish state, what are believed to be the predictions of Jewish seers and singers in the days before Christ may or may not be fulfilled, but under no consideration whatever are Englishmen justified in committing wrong in order to accelerate what they believe to be the fulfilment of prophecy or the act of God. . . .

And if it be the old Hebraic Puritanism that is at the back of our Christian support, what is it that is at the back of Zionism itself? A conviction—we see it in Herzl, we see it in Mr. Herbert Bentwich, in Mr. Norman Bentwich, yes, even in Sir Herbert Samuel—that the Jews are the Chosen People, that their God is a God apart. It is all very well to put up fine phrases and use picturesque language about a National Home, or add a clause for the safeguarding of the rights of other nationalities—"self-determination" and so forth. When it comes to the real issue the convinced and conscientious Jew demands and insists upon preferential treatment. This, in the light of his own philosophy of religious exclusiveness, he is justified in demanding; and this in Palestine under Zionist control he gets.

When a few months ago I was in the United States of America I was asked to meet a group of influential Jews; some were doubtful, some extreme Zionists. I was asked to give an example of preferential treatment to Jews and consequent injustice to non-Jews. I said I would do this provided my friends present would each say whether the case cited was injustice or not. They agreed, so I recounted the episode of the Jaffa port concession—its refusal to a non-Jewish group because it was to be reserved for a Jewish group later. The people of Jaffa who were non-Jews thought it a gross injustice that concessions, while accorded to Jews, should be withheld from non-Jews. All my Jewish friends agreed but one, he, carrying the argument of political Zionism *à outrance*, said Sir Herbert Samuel was quite right to withhold the concession, because, under the terms of the Mandate, Palestine is eventually to become a Jewish State, and therefore it is Jews, and Jews only, that should have that or any concession. Sir Herbert Samuel, when this sense of injustice had been pointed out to him, though doubtless genuinely anxious not to be unjust to non-Jews, pleaded that his hands were tied by the Mandate. Other cases could be given. And that brings us to the root difficulty. The Mandate itself is based upon injustice.

Once again let us clear away the cobwebs, let us be honest with ourselves. My American extremist was quite honest; he was out after an idea. I have been engaged most of my life in some idealistic enterprise or other, and I have been proud to number Jews among my most enthusiastic, farsighted and single-hearted supporters. We have always believed in the soundness of these enterprises, but they were sound only in so far as they were not urged in a spirit of exclusiveness. It is when an idea takes the form of private property in the Deity, "My God is my God and nobody else's," that it becomes dangerous.

The Case for the Arab

AND there lies the danger of political Zionism. It is a danger both to the world and to Jewry, and Mr. Bentwich and his friends have to be fought—kindly, affectionately, but none the less firmly fought—because what they stand for is fundamentally unrighteous. Listen to Mr. Norman Bentwich, the present Attorney-General and maker of the laws in Palestine: "The harmony of Hebraic and Hellenic ideas . . . . may be achieved in the future by a self-conscious Jewish people which will imbibe those elements of outside thought that are ennobling, *but will transmute them by the dominating Hebrew spirit.*" The italics are mine. Herzl's plea for the Jews of the Ghetto is a very different thing from this—the dominating Hebrew spirit. By all means let us clean up the Ghettos of the world, but let us not do it by the dispossession or domination of other peoples, and still less upon the faulty hypothesis that the country we propose to take from them is ours by right, or in virtue of promises made by God—promise of which the sublime symbolism may stimulate us to great deeds, but in the literal fulfilment of which the majority of us no longer believe . . . .

It is characteristic of the "Philo-Zionist" and his glasses of rose that he is unable to see that the Arab has a case. He does not know, or will not face the fact, that eighty-five per cent of the population of Palestine are not Jews, and that the Arabs, so-called, the peasantry of the country, are the descendants of those original inhabitants whom the Jews never succeeded in absorbing, and by whom they were ultimately expelled. The "Philo-Zionist" will not face history, and the answer to him, from the Arab point of view, is best summed up in the words of the Moslem Sheikh in Jerusalem, who, when the Balfour Declaration, sublimely ignoring 1,000 years of history, was first read to him, said, "Give Palestine to the Jews? Certainly. Why not? Give us Spain, and we will give you Palestine. We have as much right to the one as you to the other."

Into Pools and Ditches

IN ADDITION to its dead religion, and its unsound history, the romance has its spurious economics. Perhaps Mr. Bentwich will allow me to recount the parable of the Palestine gardeners—Mr. Norman Bentwich is acquainted with those gardeners—who worked for me when I was engaged on the Jerusalem park system. I was asked to employ Zionist labor, and delighted to do so, making one only condition that my labor must be drawn as equally as possible from all denominations. Then it leaked out that the wages of the Jews were being supplemented by some Jewish organization. The Christian and Moslem employes on my staff resented this, to them, false application of the Parable of the Vineyard. Nay, more, they objected that not only did the Jewish gardeners decline to work on an equal footing with the non-Jewish workers, they all wanted to be foremen. Protests were entered against preferential treatment, and the answer was returned by those in authority, and who were dispensing the Jewish dole: "Our people have a higher standard of life, and you cannot expect them to work for the same wage." The Jews did not see it as parasitism. What happened? What was bound to happen? For a while we tried vainly to pay strictly according to merit, but in the end the subsidized Zionist workers had to go, and gave place to others, non-Jews, who were not moved by the Herzl-Bentwich romance . . . .

The politics of Zionism have got to be spewed out; the exclusiveness and nepotism have got to be strictly barred off; the finance and exploitation—oil, potash, and so forth—have to be given their place, like the power-houses and factories of great cities.

Many of us, Englishmen and Jews alike, when we first went out to the East, went with the hope of doing the straight thing to all, whether Arab or Jew. It has been that "dark lanthorn of the spirit" which the political Zionist holds that has lost us our road, and led us into pools and ditches. For I, as many another Englishman who has served in Palestine, know how difficult it is now to get things done that were easy before, when we were trusted and known to be acting fairly to all. We are "sounding for Christendom in a dirty pond."

And the way out? How to regain that confidence of the people which we have lost? There are only two alternatives: either evacuation—we must leave the country to work out its own destinies, that self-determination which we promised when we came recruiting for the Arab army; or a straightforward British Government, administered not by a Jew, nor a Moslem, nor anyone with a sectarian bias, but an Englishman—in the equal interests of all. It would be perfectly possible for the British Government or the League of Nations now to say: "When we initiated this policy of the 'national home' we thought, nay, we hoped and believed, three things: first, that the Jews themselves would be unanimous in their support of it; secondly, that it would not be unwillingly accepted by the people of Palestine; thirdly, that no burden would fall upon the British taxpayer. We now find, first, that the Jews are by no means unanimous, and, indeed, often actively hostile; secondly, that the overwhelming majority of the people of Palestine repudiate it; and, thirdly, that it can only be established by force of arms and at heavy cost to the British taxpayer."

Arabs Bitter Against Jews, Says Observer

STORIES of antagonism between Jew and Arab in Palestine have been slow in reaching the United States. Enthusiastic Zionist leaders have returned from the Holy Land with glowing pictures of how the desert is being reclaimed and developed by Jewish initiative and enterprise so that it again "blossoms as the rose." Racial and commercial rivalries have for the most part either been denied or ignored. But an American observer, Professor Russell Galt, of the American University at Cairo, sees in the "blatant return of the political Zionist, who is without any religious motive whatsoever, in his loud pronouncements that he is going to take the land and put the Arab out, with his grasping Jewish habits given fuller rein by British guns, a national miscarriage of common justice that no man who calls himself a Christian can tolerate."

Professor Galt points out that the contradictory promises of the British Government during the war—independence of Arab countries to King Hussein of Mecca and approval of a Jewish national home in Palestine to Jewish financiers—have brought trouble and disaster. The Moslem and Christian Arabs number ninety-three per cent of the population and have united to prevent the Jews, who comprise seven per cent of the population, from putting them out of their land and their homes, for such, he believes, is the purpose of the political Zionist. In Palestine one witnesses the unusual sight of Moslems and Christians united against the Jew. Riot, murder and anarchy have resulted.

The protest of two Arab students at the university in Cairo who were Professor Galt's guides in Palestine is typical of the feeling of the Arabs. They inquired: "What right has the Jewish minority of seven per cent to put us out of our land and our homes and rule us, when as a matter of historical fact we Arabs have held our Palestine longer than the Jew ever did?"

Methodists Convene a Real Congress of Nations

Pass Resolutions Regarding Peace, Union and Prohibition Laws

By ALBERT SYDNEY GREGG

High Spots

Decided to call a world church council to oppose war.

Voted to unite with the Methodist church, South.

Provided for ordination of women preachers.

Eliminated specific prohibitions against popular amusements.

Simplified "confession" for uniting with the church.

Limited bishops to eight years in one area, and district superintendents to six years in one district.

Commended the Goodwill System for doing missionary work among foreign language people.

Asked Congress for an amendment to the Federal Constitution to prevent child labor.

Urged Congress to centralize prohibition enforcement, provide for selection of agents under civil service, and to deport alien bootleggers.

Appointed a committee to oppose adoption of plank by Republican and Democratic conventions that would weaken prohibition.

Retired five bishops and elected five new bishops.

FOR twenty-nine days—May 1-29—the General Conference of the Methodist Episcopal church was in session in the Municipal Auditorium, Springfield, Massachusetts. It was a real congress of nations, composed of 858 delegates equally divided between ministers and laymen, forty-four of the latter being women. Turbaned Hindus mingled with Chinese, Japanese, Koreans, Germans, Liberians, Italians, Mexicans, Negroes and Anglo-Saxons.

All classes were represented. Millionaires and clerks, judges, ex-governors, Federal officials, lawyers, merchants, doctors, professors, editors, lecturers, Negro letter carriers, and pastors of all sorts of churches big and little, orthodox and liberal, met on a common level.

While the conference was vociferously radical in speech at times, it was conservative in action and persistently refused to vote precipitately on any question. Practically every proposition presented was sent to a committee.

The "war question" came before the conference in the form of a report from the committee on the state of the church. This committee had voted two to one in favor of a strong anti-war declaration which closed with this sentence: "We as an organization separate ourselves from war, and take no part in its promotion."

An emotional upheaval resulted in which the ultra-pacifists almost forced the conference into a position that would have "thrown the Stars and Stripes out of every Methodist church." A minority anti-pacifist report proposed to amend the resolution by adding the clause . . . . "unless indisputably in self-defense, or in defense of humanity."

Telegraphic protests against extreme pacifism began to pour in upon the delegates, with the result that the entire matter was referred to a special committee of fifteen. After several days' deliberation, this committee presented a comprehensive, statesmanlike document which was aptly characterized by the Springfield *Republican* as a "plan let down out of heaven."

Among other things this resolution declared: "We shall launch an aggressive campaign to teach the nature, causes and consequences of war. The glorification of war must end. We set ourselves to create the conditions of peace. Selfish nationalism, economic imperialism, and militarism must cease. We demand that the principle of the conscription of wealth and labor must be the counterpart of any future conscription of human life.

"We urge the President to summon another conference of the nations for a more drastic reduction of armaments. We demand the immediate entrance of the United States into the Permanent Court of International Justice. The participation of the United States in the League of Nations will receive our active support. We shall elect men to office to secure these ends. The ballot and other direct processes of democracy must now be employed in securing a warless world . . . .

"We therefore propose that our church now assume its responsibility by appointing at this general conference a commission of twenty-five members, to be composed of five bishops, ten ministers and ten laymen, authorized to call a conference of the religious forces of the world to consider the best plans and methods for making the impact of Christendom against the evils we deplore."

The foregoing plan was adopted unanimously with very little discussion.

Early in the session a challenge to the leadership of the "elder statesmen" relative to peace and other matters was made in very positive terms by three eloquent young men who appeared before the conference as spokesmen of the National Student Conference held in Louisville, Kentucky, on April 18-20. The three speakers were Walter Mueller, of Garrett Biblical Institute; Stanley High, Boston University; and R. D. Ware, of Vanderbilt University.

Voice of the Young People

THIS student conference, by the way, had a very significant relation to the general conference.

It was composed of five hundred students from more than one hundred colleges and universities, who had met at their own initiative and expense to consider important questions affecting Methodism and the Christian church in general. The speakers said there was no sidestepping of vital issues. The young people had honestly undertaken to make the facts of life conform to the idealism of Christianity, in place of adapting idealism to facts. They discussed peace, harmony in the industries, the race question, prohibition, divorce, and a United Methodism. They did not apologize for their youth, or their uncompromising views. They were supremely interested in building a new world order, and were loyal to the church as a mechanism to accomplish that purpose.

To use a pungent expression of one of the speakers: "The young people of Methodism are asking that the ideals of Christ be given a chance."

Prolonged applause was evoked when the three earnest young men urged that the church do something to make another war impossible.

It was a new note in a Methodist general conference —the voice of Youth and of Tomorrow, summoning the fathers of the church to a renewed and more practical attack on the evils that destroy mankind. And it is worthy of note that the "elder statesmen" accepted the challenge by taking an advanced position all along the line.

Next in significance to the "war resolution" was the acceptance of the plan to reunite the Methodist churches of the North and South. Eighty years ago the church split over slavery. Various attempts have been made to bring the two sections together, but without success. A commission created by the general conference four years ago met with a similar commission appointed by the general conference of the Southern church, and worked out a simple plan for reunion. It is little more than a confederation, but it is a start in the right direction. Bishop W. F. McDowell, chairman of the commission, expressed it thus:

Recognition for Women

"WE HAVE been trying to get together upon a basis of arguing apart and occasionally praying together. We are trying to get together first. We propose to unite by sharing our common tasks at home and abroad . . . . We are willing to take that church as it is; that church is willing to take us as we are. With a minimum change at the start, and the making of changes as we go along, we will soon find that we are together."

The unification plan was adopted by a vote of 802 to 13. Later some of the thirteen protested that they had not been given an opportunity to speak in opposition, and they were authorized to print their remarks in the *Daily Christian Advocate,* official organ of the conference.

The next step will be for the bishops of the Southern church to call a special session of their general conference to act on the plan. If the Southern church acts favorably, the unification plan will be passed on down to the annual conferences of both denominations. After a majority of the annual conferences have ratified the action of their respective general conferences, the final step will be to elect a new general conference to complete the details of the reunion, and choose a new name for reunited Methodism.

Unification, once consummated, would unite about 8,000,000 Methodists in one denomination.

Miss M. Madeline Southard, a woman preacher from Winfield, Kansas, in a stirring speech, demanded a place for women on the general boards of the church. She declared that the failure of the conference to do so in the past was a "hangover from paganism." After the usual exciting debate, her proposition was referred to a committee where it was nicely buried.

While the women did not make much apparent gain in obtaining "official recognition," they did get something worth while after all. The conference voted to give orders to women local preachers, so they can administer the sacraments and officiate at weddings.

During the debate over ordination, sage and sympathetic advice was given to the delegates by Dr. J. R. Chitambar, principal of the Christian College, Lucknow, India.

"Get the women to help," he suggested, "but on ordination go slow. If this conference authorizes the ordination of women preachers, such action will cause complications in our country, for in India the women have not yet begun to wear the breeches."

The conference adopted the report of the commission, which grants orders to women as local preachers, but does not authorize or require them to join an annual conference.

Questions of doctrine and creed did not cause a great deal of discussion. The fundamentalists were on the job early, ready for a fight, but there was no opportunity. The episcopal address, presented by Bishop Joseph F. Berry, contained a statement of doctrinal views that "took the wind" out of the fundamentalists, and the conference had peace on that score.

What is known as the "doctrinal test" was eliminated as a condition of admission into church membership. Hitherto every applicant has been required to answer this question: "Do you believe in the doctrines of the Methodist Episcopal church, as set forth in the book of discipline?" The new questions are based on a confession of faith in Jesus Christ, without any theological definitions whatever.

A "twenty-year war" against the specific ban in the discipline against popular amusements reached a climax in this conference, and resulted in a very important modification in the law of the church on that subject. Theater-going, dancing, games of chance, and so forth, are no longer specifically prohibited, but Methodists are required to avoid diversions "which cannot be used in the name of the Lord Jesus." There was no debate. The report adopted included a "solemn warning and entreaty, particularly against attendance upon immoral and questionable theatrical and motion picture performances."

Dr. George Elliott, who presented the report, said in explanation:

"We are not beating a retreat. We are going forward. Religion must appeal to the conscience, and it is the conscience that must be considered. This new law goes back to Wesley, Paul and Jesus Christ, and forward to a time when law shall be no more because it is written in the hearts of men.

"Preachers will now stand in their pulpits not with a policeman's club, but with a shepherd's crook in their hands."

The race question was raised in several ways. One proposition opposed the exclusion of Japanese, another demanded equality of ratio in the admission of aliens, and another consisted of a protest to President Coolidge and Congress against lynching, and demanding Federal legislation on that subject.

For months before the general conference met, there was much discussion about the "revolt" against autocracy among the pastors, and on this issue a larger number of pastors than usual were elected delegates. This hostility found expression in the action limiting bishops to eight years in an area, and restricting district superintendents to a term of six years. A plan was considered to have district superintendents elected by the annual conferences in place of being appointed by the bishops, but such a change was declared to be unconstitutional. The conference was asked to decide whether it had the power to place a time limit on the life tenure of a bishop, but the proposition was tabled. While no action was taken, it appeared to be the sentiment that any attempt to limit the official life of a bishop would tend to "do away with the episcopacy," which is forbidden in the third restrictive rule of the church.

In setting up plans for dealing with foreign language peoples special mention was made of the Goodwill Industries headed by Dr. E. J. Helms, of Boston. The Goodwill system is in operation in twenty-seven cities, and creates jobs for the very poor and the handicapped by gathering up cast-off clothing, furniture and shoes, remaking this material and selling it at nominal prices. Last year the Goodwill Industries paid out more than $1,250,000 in wages. The plan is to extend this system all over the country. Religious activities are carried on in connection with the industries.

No divorce, except for adultery, is regarded as lawful by Methodists, and no Methodist minister may solemnize marriage in any case where there is a divorced wife or husband living; but this rule does not apply to the innocent party to a divorce for the cause of adultery, or to divorced parties seeking to be reunited in marriage. Several fierce attempts were made to modify this rule so desertion and other grounds would be recognized, but the conference refused to make any change, although the votes were very close.

Against Child Labor

A RESOLUTION was adopted asking Congress to submit an amendment to the Federal Constitution that would enable the courts to prevent child labor. Congress was also called upon to centralize prohibition enforcement in one bureau, provide for the selection of agents under civil service rules, and deport aliens who persist in violating prohibition laws. (Since this was written Congress has taken such a step with reference to prohibition enforcement, though not as a result of the action of the general conference.)

A committee was created to appear before the committee on platform of the Republican and Democratic conventions and oppose the adoption of any plank that would weaken the Volstead Act.

The commission on courses of study for ministers, headed by Bishop Edwin H. Hughes, reported *that only twenty per cent of the regular pastors of Methodism have had both college and seminary training, and that only eighteen per cent have even completed a high school course.* Thus eighty per cent of the men in Methodist pulpits got into the ministry by way of "brush college." They took a four-year course provided for under the regulations of the church, while engaged in active church work, as pastors. Bishop Hughes thinks this situation is "getting no better fast," and while he urges candidates for the ministry to get a college and seminary training, he realizes that the bulk of the preachers will continue to "grab their education on the run, 'brush college' fashion." For that reason he places great emphasis on the importance of improving the conference courses of study, and urges that every possible provision be made to aid the students in obtaining the necessary mental preparation.

Five retirements among the bishops created five vacancies which were filled by the election of Dr. Wallace E. Brown, pastor of University Church, Syracuse, New York; Dr. Titus Lowe, secretary of the board of Foreign Missions, New York; Rev. Dr. George R. Grose, president of DePauw University, Greencastle, Indiana; Rev. Dr. Brenton T. Badley, of Calcutta, India, executive secretary of the centenary mission in India; and Rev. George A. Miller, superintendent of the Central American Mission, Panama City, Panama. All the newly elected bishops have been sent to fields outside of the United States.

In the general shake-up fourteen bishops were shifted to new scenes of action.

Solving Scientific Secrets

Finest Sound Laboratory in the World; Owner Is One of America's Foremost Cryptologists

By GEORGE H. DACY

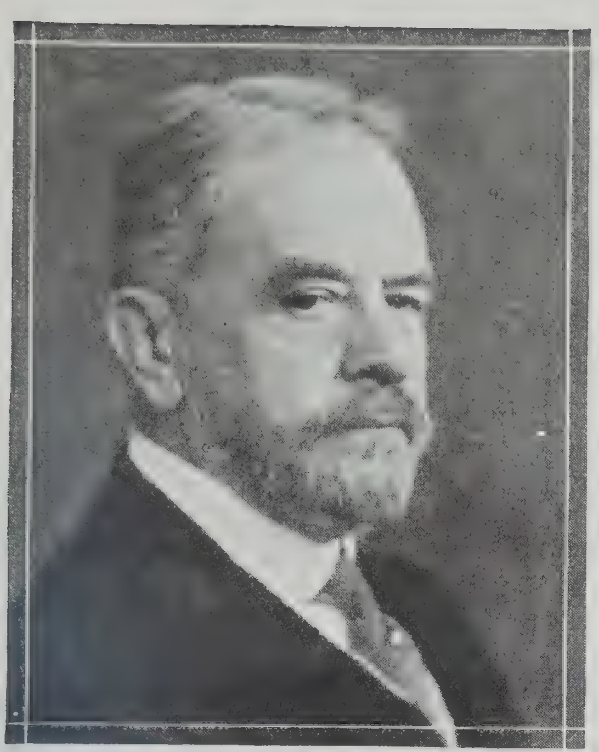


Photo Eugene Hutchinson, Chicago.

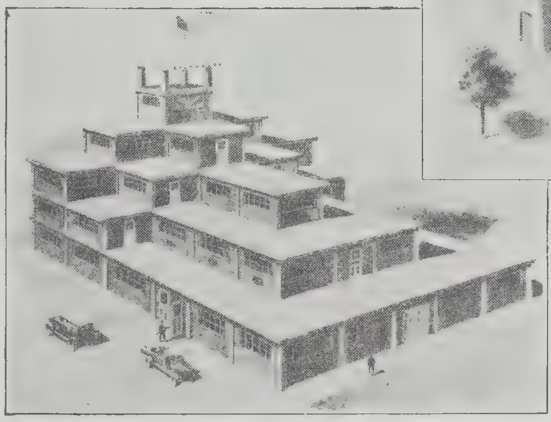
COLONEL FABYAN.

DOWN in the pastoral and peaceful Fox River Valley region of Northern Illinois reside two famous Americans; the one, Sydney Smith, the author of the "Andy Gump" comics, puts the laugh into Sunday reading in all sections of the country; the other, Colonel George Fabyan, outstanding international cryptologist and amateur scientist who has endowed and maintains the largest and finest sound laboratory in existence, specializes in the successful solution of scientific secrets which previously have evaded the investigations of our leading universities and private and public research.

"Syd" Smith, or "Andy Gump," as he is familiarly known wherever cartoons are perused, courts publicity, for it is the matchless dynamo which functions the daily activities of the man who tells jokes with his sketching pencils. Colonel Fabyan, on the other hand, shuns publicity.

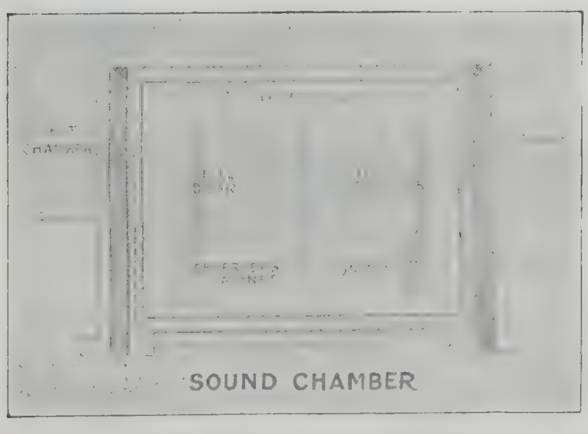
When I visited Colonel Fabyan at his 550-acre estate near Geneva, Illinois, I found him about as communicative as the Sphinx of Egypt until I assured him that I would prepare a very conservative article about the remarkable doings, the remarkable equipment, the remarkable buildings at Riverbank Estate and their remarkable owner. A large man in both stature and mentality, Colonel Fabyan is rugged and robust despite his advanced years. He is still active in the cotton mills industry and is devoting his entire fortune to the commendable work of sleuthing out medical and physical riddles which heretofore have been scientific enigmas.



General view of building showing construction.

Colonel George Fabyan is a self-tutored cryptologist, an expert in the ciphering and deciphering of codes. During the World War, he maintained the only training school for the military intelligence service of the United States Signal Corps in secret code nomenclature at his Illinois farm. At one period, the student officers totaled more than 200, and Colonel Fabyan had to charter a hotel in a neighboring city for their accommodation. An acquaintance well qualified to know told me that the patriotic colonel spent approximately one-quarter of a million dollars in his military research and schooling activities designed to aid Uncle Sam.

The study of codes and secret ciphers has long been a hobby with Colonel Fabyan. He has made a profound investigation of codes and ciphers dating as far back as 2000 B. C. He ranks as one of the leaders in this curious research. During the war, he not only assisted the United States Government in this cryptographical work but also aided the Allies. Decorations such as the Legion of Honor and the Order of the Rising Sun have been conferred on the colonel, while he also treasures rare testimonials from our war leaders at Washington.



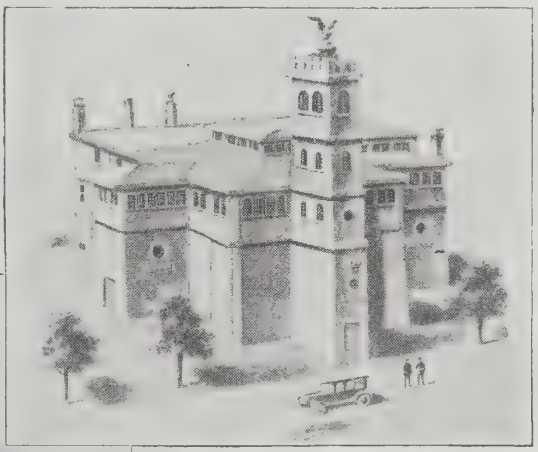
Plan of the wonderful sound chamber.

On a ten-acre field on the Fabyan estate, the first demonstration trenches in America were dug by British officers and soldiers and used for the training of the Americans. Simultaneously, the dozen laboratories owned by Colonel Fabyan devoted their efforts to the problems of high explosives and other military munitions. Colonel Fabyan paid the bills.

If you are familiar with the abodes of the aboriginal cliff dwellers or the adobe villages of some of our southwestern tribes of Indians, you will have some understanding of what the largest laboratory building at Riverbank looks like. The structure is built in terrace form. The roof of a portion of the first story forms a terrace for the second floor. At any time, when additional space is needed, all that is necessary is to add the extra walls and roof. The building has been most carefully planned. Every nook and corner is devoted to specific purposes. There is neither waste nor idle space. Even the tower rooms and turrets are designed to serve their special uses.

The acoustical laboratory was built for the use of the late Professor Wallace C. Sabine, of Harvard University. Professor Sabine, one of the leading sound experts of all time, was an intimate friend of Colonel Fabyan. The latter built the curious research workhouse and financed a marvelous program of sound investigations mapped out by the professor.

The sound laboratory contains a building within a building, the inside sanctum being wholly insulated from errors and sound intrusions introduced from the outside, and is supported by special walls and foundations. In this novel scientific chamber, the sound, reflective, and absorptive properties of many kinds of material have been tested. The acoustical secrets of cement, plaster, stucco, brick, concrete, lath and other building materials have been ferreted out. All sounds produced in the inside chamber can be studied and analyzed as they pass through special panels fitted with test materials to the exterior rooms.



Front view of laboratory.

Talk, or just barely whisper, in this steel-doored chamber and a perfect flood of confusing echoes comes pouring back at you from all directions. The babel and pandemonium which result when you speak, sing, or whistle amaze and startle you. There is no chance for any of the sound waves to escape. It takes from ten to fifteen seconds for an average sound to be absorbed by the four walls, ceiling and floor of the chamber.

In one corner there is an extensive collection of seventy-three organ pipes that range in size and tone from small, shrill-noted ones to large, bass ones that give forth great volumes of sound. In the center of the room is an observation cabinet which resembles an old-fashioned Turkish bath box. The head of the observer is all that is visible, the rest of his body being within the box to eliminate the sound absorptive effects of his clothing during the progress of the experiments. Special steel sound reflectors are used to impinge the sound waves from the organ pipes upon the test panels when their steel doors are opened. The observer can operate the different organ pipes by a special switchboard arrangement, and uses a stop watch contrivance in recording the sound absorptive properties of the different materials tested.

Colonel Fabyan's scientists, as a result of extensive investigations in the sound chamber, have perfected a plaster and wall finishing material which breaks up objectionable sound waves and absorbs them so that reflection is reduced to a minimum. Attractive wall paints have also been developed that can be used for the decoration of this plaster without in any way impairing its remarkable acoustical qualities. Every architect or builder who has seen the experimental rooms at Riverbank—one room is built, plastered and decorated in the ordinary way while the other is equipped with the sound absorptive plaster—have immediately been converted to the use of the new finishing and decorative materials. The commercial laboratory in the community high school at Geneva has been soundproofed with the new materials and despite that twenty-four typewriters are in operation simultaneously in the room, the sound absorption is so perfect that the noise is hardly apparent.

In addition to investigating all the intricacies of sound mechanics, the Fabyan forces are also studying the functions of human hearing and the peculiarities of man's ears under many conditions.

"You probably believe that your ears are necessary that you may hear," Colonel Fabyan remarked as he motioned me into a seat before a laboratory desk. I put my index fingers in my ears as the colonel ordered, so that I could not hear anything he said. Colonel Fabyan then shouted to an assistant on the fourth floor of the building to speak into a microphone transmitter. He handed me an ordinary telephone receiver that had a steel piece fastened to the ear cap. The colonel pressed the receiver against certain bones at the base of my skull and against my teeth and I could understand all that the assistant was saying, despite the fact that my ears were not functioning as usual.

Some time or other, you have probably been present in a church, auditorium or hall where the acoustics were so bad that either you could not hear or else your ears were flooded with echoes and reechoes of the speaker's voice. The Riverbank experts have perfected testing methods by which they can fortify a building against any such auditory defects. From the building plans, they make plaster of Paris models of the building, test its acoustics, and eliminate all features which favor sound reflection.

Medical experts are surveying and experimenting with human ears under the personal supervision of Colonel Fabyan. Investigations of the auditory nerves and the spinal column such as never were attempted before in the history of medical research are now in progress. In the osteology laboratory of this remarkable philanthropic project, interesting specimens of cleverly mounted skulls, skeletons and spinal columns of human beings and many animals are on display. Even the successful treatment of cancer by radium is being investigated. I saw one patient undergo diagnosis and treatment. There is a possibility that his very critical case may even be cured notwithstanding the fact that his jawbones are now temporarily paralyzed.

They have extraordinary devices at Riverbank which take pictures of sound waves in action. A most unusual combination, piano and pipe organ, is an outstanding feature among the sound experiment equipment. If you are a musician and play a few notes, the sweet chords of a well-tuned piano greet your ear. Then Colonel Fabyan will turn a control lever and when you play on the same keyboard as before, the reverberating, long tenure tones of a pipe organ fill the room. The instrument is an electrical contrivance. The organ notes originate from the free vibration of piano strings actuated by electro-magnets governed by electrical currents of alternating frequency. Electro-magnetically operated

University Molds Men and Women for Its Own State

Concluded from page 9

view of molding the mental equipment of men and women for the best development of the state which provides them with that virtually free training. This, of course, is the basis on which all state universities should operate, but many of them are growing as rapidly as possible away from the idea that they owe anything to their own state, and into the idea that they are competing with other state universities in a race to attain the greatest attendance possible, regardless of the source of the students which make up that campus roll.

Attendance at the University of Wyoming for the school year 1922-23 was 2.277, of whom 838 were in the correspondence study division (extension department), leaving 1,439 regularly in residence. As in most of the better state universities of the West, students from outside the state are received and given the same treatment that is given those from Wyoming, but their coming is not specially encouraged. The reasons for this are not selfish, but really altruistic, since, if all students in any state desiring to go to a state university were limited to their own state's university, that state would very soon develop an institution of higher education adequate to the needs of its population. This step is one some states have been slow in taking, since surrounding states are well equipped in this particular and are unable to prevent students from states less liberal in their attitude toward education from coming to them. As a measure of self-protection, some state universities, notably those of Arizona and Nevada, have limited their attendance to a certain number, and, within that number, are giving preference to *bona fide* residents of their own states. This matter of "foreign" students is becoming a serious problem to every state university west of the Mississippi River, and even the University of California, with its 2,500-acre campus and $9,000,000 annual budget, is planning to double the fees to be charged to students from states other than its own.

This year will see the completion at the University of Wyoming of a library building costing $150,000, and housing 50,000 volumes, said to be one of the best and most comprehensive state university libraries in this country. The university also points with pride to a collection of plants of the central Rocky Mountains consisting of more than 100,000 specimens, growing at the rate of about 5,000 specimens a year. It is the largest collection of flowering plants of the West in the world, and is largely the work of Dr. Aven Nelson, president emeritus of the university, to whose efforts the discovery of more than 750 new species of plants in this region was due. He is now head of the botanical department of the university, and curator of this great collection, whose value to the agriculture and cattle-raising industries of Wyoming, as well as to the science of botany, hardly can be estimated.

The university lies on the sky line of the continent, on the wide-spreading Laramie Plains, a mile and a half above sea level, circled by snowy peaks, whose skirts are jeweled with sapphire lakes. The purple palisades of the Medicine Bows raise their silver spires to the westward; th mountains of Colorado, red in the clear sunshine, bound the horizon on the south, while to the east and north the Laramie mountain range curves in a bewildering forest of pinnacles. The history of the university is parallel with that of the pioneer in the great West, and, as the state develops, it is the plan of the government and the university to develop men and women to carry on that history from better to best. As Dr. June E. Downey, professor of psychology at the university, said: "Instead of harvesting memories, or living in histories, the eyes of the University of Wyoming rest steadfastly on the future. Yet it has its traditions. In the town that nestles at its feet (Laramie) convened the first woman jury in the world; here Bill Nye presided over the destinies of his famous 'Boomerang'; the Overland Trail skirts its borders, and a few miles away, a pyramid of granite on the highest point on the Rockies commemorates the great triumph in engineering science that linked the Atlantic Coast with the golden slopes of the Pacific Ocean."

The national intercollegiate debating championship went to the University of Wyoming speakers in 1922-23, after a record of thirteen consecutive victories, in a schedule which called for debates on both sides of three different questions with many of the best debating teams in the universities of Nebraska, Montana, Colorado, Utah, Nevada and California. This record is looked upon with greater pride by the students of this one of our younger state universities than a long line of football or track victories, though athletics in all forms are provided for and encouraged at the Wyoming university.

The sons and daughters of Wyoming are given forty-eight weeks of instruction at the university of their state, divided into autumn, winter and spring terms of twelve weeks each, which make up the school year, and an intra-session of twelve weeks, following the spring term, which the regular students may attend or not, just as they choose. There is also a summer school of six weeks. The university is divided into seven departments—the college of liberal arts, including the divisions of letters and sciences, premedical curriculum, commerce, and music; the state college of agriculture, including agriculture and home economics; the college of engineering, which covers civil and irrigation, mechanical and electrical, mining, and vocational engineering; the college of education, which includes the state normal school and the teachers' college; the college of law; the college of military science and tactics; and the correspondence study division, commonly known in other state universities as the "extension division."

One of the features which has proved particularly effective in binding the students and the graduates of this university to their state, and in setting the graduates along lines of life work in the development of that state, is the teaching of Wyoming history by counties. That is to say, every boy and girl who goes to the University of Wyoming knows the history of that particular bit of the state from which he came as well or better than the student in the average state university knows the history of the United States. Another factor in this same and rather unusual work for a state university has been the special development among the students of general knowledge of all sections of Wyoming, including the industries already established and those possible of establishment, soils and crops, and, last but not least, the immediate and future needs of the state.

Solving Scientific Secrets

Concluded from page 13

hammers cause the staccato notes of the piano as reproduced on the scientific musical instrument. This device is almost matchless in its sweet blend of notes and purity of tone. The piano strings and chimes are located in a tower at the top of the building, being worked by many electro-magnets under the control of keys and stops in the auditorium below. It is notable that this auditorium is used for the round table conferences of the Riverbank scientists. Regularly, they get together with Colonel Fabyan for informal discussions or they listen to lectures by men who come to Riverbank from all parts of the world.

Spirits walk and ghosts talk if the astounding psychic experiments under progress at the Fabyan estate are any criterion. The results obtained have been so startling that Colonel Fabyan will not allow them to be published until the tests have been repeated and the conclusions searchingly verified. The laity and medical and scientific worlds will be filled with amazement when these data are finally presented to the public for discussion and dissection.

The most extensive collection of tuning forks in the world has been assembled at Riverbank and is used in the sound experimentation. The transmission, reflection and absorption of sound are being studied more comprehensively than in any other scientific laboratory of this nature. One snub-pronged tuning fork has been coddled and polished to the point where it now will make 16,000 vibrations a second, an almost incredible record of backward and forward movement. New theories of the chord and tuning fork are being developed.

A huge bronze bell thirty inches in diameter was indulging in a novel foot bath in a mammoth vessel containing 1,200 pounds of mercury. Laconically, Colonel Fabyan replied to my inquiry about it, "Merely a study in maintained vibration."

A monorail car operated by a gyroscope stood discarded near by. It was one of a number of sets of apparatus which looked as though they were out of commission. All of which led me to inquire about what was done with the equipment when the investigations were completed.

"We have to junk such stuff, as a rule," responded Colonel Fabyan. "It is unusual where the devices and apparatus used in one series of tests can be recruited for experimental service a second time. We have several roomfuls of such scientific scrap on hand at present. Our mechanics convert some of the stuff into tools and implements which we sell to the surrounding farmers. The balance is sold to the itinerant junk dealers."

There are thirty-five buildings on the Fabyan estate, as all the scientific workers live in special houses and bungalows under an ideal colony system. A great windmill supplies power to operate a gristmill where the wheat grown on the farm is converted into flour for the use of the investigators. The pork and mutton products are home grown while beef is purchased. It is a happy fraternity and family of technical workers that serve Colonel Fabyan. They are recruited from every prominent university and scientific institution in the country. Many of them come to Riverbank during their sabbatical years and like the life and activities so well that they remain even after their university leave has expired.

Do Women Know How Leaders Commit Them?

Concluded from page 2

might be heard to thank God that she, as regards divorce, is not as the other states. Whereas Nevada, who sponsors Reno as her own, sees in divorce an asset, a commodity with a market value; promotes divorce as a source of revenue. Or so the rest of us are led to believe.

Have the women who speak through these fourteen organizations, and who would impose a uniform law on these two states that represent the extremes of opinion upon divorce—have these women, then, a law to offer the forty-eight states? And have they reason to believe that it is a good law—a law that has been tried out?

Back in the patriarchal 70's, a boy, one Billy W—— lived two doors from my home. He lived to experiment. His workshop, which was a bench in the corner of his father's stable, was as famous in our neighborhood as the Little Scorpions' Club is in the nation today. He was borne out on a plank and to the hospital on one occasion, a scalded victim of experiment as centered in a miniature engine and boiler. Still another time he blew himself through the roof, rafters and window-sashes along with him. But—and mark you this, dear ladies—he experimented in his own family stable, not in mine, nor in his other neighbors'. It was himself he blew up, not us.

Why not draft a model divorce-law; then persuade some one state—New York State has a proverbially bad law—to try it out. How long did the laboratories labor to find, say, the diphtheria serum? And M. and Mme. Curie to discover radium? A good divorce law having been proved, offer it to the remaining forty-seven states.

We have a precedent in procedure if we care for one—a case in point. Some years ago the American Bankers' Association recognized the desirability of uniform laws with reference to negotiable instruments, to do away with the confusion caused by the different laws in the different states. And after careful consideration they drafted a law known as the Negotiable Instruments Act, which then was presented to the legislatures of the different states by the local bankers, and adopted in its entirety by all, or practically all, thus giving the uniform legislation desired.

The duty of the father is to protect against outside aggression. Also of the Federal Government—"protection" by the government meaning to secure to the states and to the individual the rights reserved to each under the Constitution. If the government goes beyond this, it becomes not a protector but an aggressor. In government regulations of commerce, labor, railroads, press, government relief of the poor, government systems of education, there is danger.

"The mischief begins when, instead of calling forth the activities and powers of individuals and bodies, government substitutes its own activities for them; when, instead of informing, advising, and upon occasion denouncing, it makes them work in fetters or bids them stand aside and does their work instead of them. The worth of a state is, in the long run, the worth of the individuals composing it."

Is it that we women here in the United States need to look at things, for a bit, in the large? That we need to realize that our present weakness as citizens lies in the ignorance of our wider ignorance? That we need to lift our eyes from the particular wrong to the especial group, and, sweeping the horizon of the whole, see that there is no graver question in modern popular government than "What shall government do for its citizens?" and "How far shall government interfere with the actions of its citizens?"

When Mars Calls on Mother Earth

Concluded from page 3

Venus, Saturn, the Earth, and so on, swinging in endless and mighty rotation around it. This is absolutely certain.

These planets, which roll in rhythmic order around the millions upon millions of fixed stars, are habitable, judging them by the conditions which prevail upon the Earth and considering their comparative distances from their own "suns." Being habitable, they are inhabited, and, I believe, inhabited by creatures comparable with human beings. If we deny this, if we hold that all the billions upon billions of the worlds of space are uninhabited, we come to the obviously absurd conclusion that life on this earth is an accident, nay, more, a mistake, existing in violation of the order of nature, and without fellow in the universe. Such a conclusion is absolutely unjustifiable; it cannot be held without doing violence to the common sense of mankind. We cannot but observe that on this Earth life flourishes wherever the development of life is possible. Therefore, by whatever process life arose upon the Earth, by that same process it would arise upon the other similarly habitable worlds of space. Thus life becomes and is a general phenomenon of the universe.

General Dow—Father of the First Prohibition Law

GENERAL NEAL DOW was the father of the first prohibitory law enacted in the United States for the overthrow of King Alcohol. It was passed by the Maine Legislature in 1855, but was practically dormant for many years. After the Civil War, the Woman's Crusade of Maine, the Royal Templars, the W. C. T. U. and other temperance societies began to organize.

The most noted temperance orator was John B. Gough, while Luther Benson, the Hoosier orator of Indiana, Francis Murphy, and Miss Frances Willard of W. C. T. U. fame, were most effective speakers. Signing the pledge to abstain from the use of all intoxicating liquors was the most effective method employed in connection with this campaign. Then came the idea that the liquor habit was a disease and should be treated medically.

Out of this idea was born the Keeley Gold Cure and other similar cures which saved thousands of men.

In 1894 the writer, having studied the results of the Gold Cure and having interviewed many men who had benefited thereby, wrote to General Neal Dow for his opinion of the value of the Gold Cure in solving the mighty problem.

The following is General Neal Dow's letter. It was regarded as forcible and characteristic at the time, and strangely enough, in view of our national Prohibition law in 1924, his opinion is as potent today as when written thirty years ago:

> Portland, Maine
> June 26, 1894
>
> Dear Sir:
>
> I have no doubt that the Gold Cure is a very good thing, but can have little or no influence in diminishing intemperance.
>
> It is like the men who with stretchers carry the dead and wounded from the field of battle. The shot and shell and canister keep them always busy.
>
> Nothing but annihilation of the liquor traffic can relieve society from the dreadful curse of the saloon.
>
> Respectfully,
> Neal Dow.

Although it appears to be difficult to enforce the law, another vote by the people would undoubtedly sustain it on our statute books.

Hard Work Equivalent of Genius

Great Men Who Did Things Thoroughly

By VICTOR MITCHELL

HOW often do we hear it said that so-and-so is "a great genius," meaning that the individual referred to is a man whose ability is as far above the average as a lofty mountain peak is above the nethermost working of a coal mine. But what is genius? Dr. Samuel Johnson—as well as many others since his day—denied that genius was born with certain men or inherited by them like a title or a big fortune. "People are not born with a particular genius for particular employments or studies," he wrote, "for it would be like saying that a man could see a great way east, but could not west. It is good sense applied with diligence to what was at first a mere accident, and which by great application grew to be called by the generality of mankind, a particular genius."

Other writers, while admitting that dogged application is necessary to success in all kinds of work, maintain that all the application in the world will not make a man an eminent artist, poet, musician, or mechanic, unless he has a natural gift for some of these pursuits. It is said, for example, that if a child, almost as soon as its little fingers can grasp a pencil, tries to draw surrounding objects, an artistic genius is there, and should not be neglected. But how many children are there, especially boys, who as soon as their fingers can clutch a pencil, a piece of chalk, or a burnt stick, do not wish to cover every available surface—walls, furniture, floor—with crude attempts at the delineation of familiar objects? One might as well say that when a small boy beats a toy drum or blows a tin trumpet, he is a great musician in embryo; that when he gets hold of a superannuated clock and pulls it to pieces, he will turn out a skilful mechanic, or that when he gathers together a few wooden blocks and builds a miniature house with them, he will develop into a great architect. Every little boy does these things, for it is as natural for him to deface the walls and furniture, to make strident noises, and to pile things up, as it is for a duckling to make for the nearest pond, or a chicken to scratch in the litter in search of food.

Dickens and His Methods

THERE is no doubt, however, that when a child comes to the age of reason, any natural aptitude it may display in the direction of any particular employment should be carefully noted and encouraged. The successful development of such definite tendencies is true education, and the training which turns a child aside from its marked vocational inclinations is altogether false. If such manifestations were noted and acted upon, we should not so often see the round plug in the square hole, and the world would contain more of those much-to-be-envied men whose occupation is their pleasure—whose heart is in their work.

Someone has defined genius as "an infinite capacity for taking pains," and experience shows that hard work and successful achievement are inseparable. This is fully borne out by the lives of great men. The world's greatest scientists have devoted many years of research to the subjects which brought them fame; great inventors have worked many years in developing the germ of their discovery, and literary men have attained eminence only after years of toil. Perhaps there is no greater popular fallacy than that words flow from the pens of famous writers just as a clear and limpid stream pursues its placid way among green pastures and flowery meads; that writers, with a fit of inspiration on them, sit down and perform prodigious miracles with fountain pens, with the facility of a stage magician.

I have before me a facsimile of the manuscript of Charles Dickens' "Christmas Carol." Anyone who has seen the manuscript of this, or of any other of Dickens' masterpieces, has learned at a glance from the blottings and interlinings, and from the deletions and substitutions, that their composition was a work of infinite toil. At a banquet given to Dickens not many years before his death, he said that all he could claim in establishing the relations which existed between himself and his readers was constant fidelity to hard work, and remarked that his literary fellows knew very well how true it is in all art, that what seems the easiest done is often the most difficult to do, and the smallest truth may be the outcome of the greatest pains.

Laying Good Foundations

"WHEN I was painting a portrait of Dickens," said Mr. Frith, the distinguished artist, "it was arranged that I should sit in his room while he was at work. He was a most painstaking, industrious, and methodical man, and nothing would divert him from the regularity of his habits. I was there for hours, and he wrote, as it seemed to me, almost with anguish. I looked in his face, and watched the anxiety and the care. I saw the blotting and the rewriting of his work, and was astonished to find how much he owed to his indomitable perseverance."

It has been advanced in opposition to this essential characteristic of hard work in literary composition that Sir Walter Scott, unlike Dickens, wielded an extremely facile pen; that some of his books were written as fast as his quill could fly; but this facility was only acquired through years of preparation, and after Scott had been thoroughly permeated with his subject. He was forty-three years of age when "Waverley," the first of his long series of novels, was published, and for many years previously he had steeped his soul in that romantic lore of which he made such brilliant use. Nothing could exceed his care when getting up a subject. He studied it from every angle, and no detail was too trivial for use in the building up of the whole. It is recorded that in writing "Rokeby" he went in search of "a good robbers' cave, and an old church of the right sort," and did not give up until he found what he wanted. A friend who accompanied him observed that he noted down even the peculiar little wild flowers and plants that grew on the side of the crag near his intended cave of Guy Denzil, and suggested that daisies, violets and primroses would be as poetical as any of the specimens he was examining. But Scott replied that in nature herself no two scenes are exactly alike, and that whoever copied truly what was before his eyes would possess the same variety in his descriptions, and exhibit, apparently, an imagination as boundless as the range of nature in the scenes he recorded; whereas whoever trusted to imagination would find his own mind circumscribed and contracted to a few favorite images; and the repetition of these would sooner or later produce that very monotony and barrenness which had always haunted descriptive poetry in the hands of anyone but the patient worshipers of the truth.

Before he wrote "Lalla Rookh," Moore spent nearly eighteen months in the reading of Greek and Persian works. The result was that it exhibited such fidelity to Oriental manners, customs, and scenery, that its popularity, even in the East, was extraordinary and the people found it difficult to believe that it was written during the depth of winter in a secluded habitation in the wilds of Derbyshire, England, which was the farthest the poet traveled to secure his "local color." Moore's songs were also the product of much labor. On one occasion he wrote to a friend: "You will hardly believe that the two lines which I had, with many hours of thought, proposed to insert in the vacant places, displeased me so much when I read them yesterday, that I am still at work for better. Such is the easy pastime of poetry!"

Byron once declared that Sheridan had written the best comedy, the best opera, the best farce and delivered the best speech ever known. Sheridan, in the eyes of his friends, was a brilliant wit and writer, producing bonmot, speech, or play without effort; but when Moore published Sheridan's manuscripts after his death, it was discovered that all was the product of toil and elaboration. The vein of wit which Sheridan had been going over in the morning, he would wait patiently to introduce in such a manner that it appeared an inspiration; and his speeches were often written several times over, and committed to memory.

Energy Rather Than Talent

THE industry and application of Lord Macaulay, whose writings are so vivid, was untiring. He would spend hours at a time in the library of the British Museum hunting up what many would think an unimportant fact. Those who study his works and note with admiration the brilliancy of his style, little know with what labor they were produced. His thrilling narrative of the Monmouth rebellion and the Battle of Sedgemoor was written in a cottage on the Somerset marshes, in which he spent weeks, so that no detail to be gained on the spot might be wanting in his description. To this painstaking quality, more than any other, he was indebted for his fame. Edward Bulwer Lytton—himself an indefatigable worker—once said: "What men want is not talent; it is purpose; in other words, not the power to achieve, but the will to labor." It was also declared by Lord Chesterfield that "the power of applying one's attention, steady and undissipated to a single object, is the sure mark of superior genius."

Dr. Arnold, the famous headmaster of Rugby, once wrote as the result of his experience: "The difference between one boy and another consists not so much in talent as in energy"; and his successor, Dr. Temple, said: "Nothing can be a greater mistake than to suppose that genius dispenses with labor. What genius does is to inspire the soul with a power to persevere in the labor that is needed; but the greatest geniuses in every art invariably labor at their art far more than all others, because their genius shows them the value of such patient labor, and aids them to persist in it."

If we accept the testimony of these eminent thinkers, it would appear that the secret of success lies in having a definite object, pursuing it patiently and persistently, and bringing to bear upon it every atom of intellect with which man is endowed. The triumphant issue of such efforts is what the world calls genius.

The Disappearing Ranch

Concluded from page 4

mented successfully with the Brahma. We have found that the Herefords have certain constitutional defects unfitting them for range conditions in a hot country. Extreme drought hurts them. They are indolent. Their hair is long, especially in winter, and does not shed before the arrival of warm weather. They are not accustomed to long-distance traveling. The Brahma has none of these defects. While the white face needs shade, the Brahma will lie in the sun to sleep. In the beginning a beast of burden, he stands up well under long travel. With these facts in mind, we have crossed the Brahma and white face, and the combination has made an ideal animal; heavier, stouter, and easier to handle.

"We extended our experimentation to horses and sheep. We have imported Arabian stallions. We are breeding the Togenburg Swiss goat, and if ever the American family overcomes its prejudice to goat milk, we will have an important contribution to make to the dairying industry."

Some Ranching Hazards

MR. KLEBERG discussed the hazards of ranching on a large scale. Some seasons are good and some are bad. It is necessary on the King ranch to farm 10,000 acres for reserve feed, and at peak times to employ 2,000 persons to conduct the business of stock, farms, and dairy. A drought that kills the grass is a very serious matter, since there are 100,000 head of cattle on the King ranch, with an annual calf crop of 50,000—all fine stock.

"In 1918," the ranch master said, "we had a disastrous drought, and our man power gone to the war. It was so bad that I sent crews of Mexicans through the pastures at night, with torches, burning the thorns from the Mexican cactus plant that the stock might eat both pad and water-bearing fruit. It was heart-breaking to see the stock strung out in long processions, following the torch bearers from plant to plant, lowing piteously the while. It was a time when the country needed meat as never before, and Nature appeared to pick that time to deal her heaviest blows. But we weathered it.

"For many years the Mexican fever tick has been a serious menace. Quarantines have been imposed from time to time by many states against Texas stock. The first dipping vat ever built in the world was built on this ranch, in 1889, even before the Federal government recognized that there was a tick menace. We had discovered it and called the government's attention to it. When you consider the number of cattle on the ranch and the fact that we have them dipped every eighteen days, you will appreciate our difficulties. I am glad to say that we now are—from end to end—entirely free of the tick. The small herd of 2,000 white face yearlings which you saw have been dipped twenty times. But it was worth it. Keeping them free of the tick, we put 500 pounds of weight on a one-year-old.

Bells of the Past

"SUCCESSFUL ranching requires large capital and large land holdings, with a railroad near. Captain King and his associates realized that when they financed the building of two railroads into this country. The day of haphazard stock raising is gone. Inclosure of the range in fence brought about the disappearance of the longhorn. The ranch which does not now improve the blood of the herds will never succeed—a scrub cow eats as much grass as a thoroughbred. The ranch must meet the changing order and accommodate its steps to progress. That done, the future of the ranching industry is secure. It will remain secure as long as the human family eats meat and uses leather."

The booming of a bell on the tower summoned us to the departing guest's farewell meal. We gathered in the great dining hall. There were a dozen of us, with plates laid for twice the number. That is a custom in the cow country. At the head of the long table sat the owner of the ranch, the venerable Mrs. King; at the foot, her son-in-law; and along the sides, his wife, sons, daughters, and guests. At a smaller table a nurse was attending to the wants of the younger generation, the sturdy and noisy grandchildren. The atmosphere was informal; the young ladies wore boots, khaki trousers and loose shirts, with knotted red handkerchiefs about their necks.

The meal was served by *mozos* pattering in and out in their loose slippers. The low-voiced orders from master to man were given in the Spanish tongue. Musical Spanish phrases fell thick and fast. In the food was an intriguing touch of garlic. If the viands were Mexican in flavor, it was but a contribution to an effect already overwhelmingly Spanish. The mansion itself, the roofless *portales* surrounding the *patio*, the dome-shaped turrets, the tower, the antiphonal chant of the bell—

"Bells of the past, whose long-forgotten music
    Still fills the wide expanse,
Tingeing the sober twilight of the present
    With color of romance"—

It *was* romance. Mrs. King retired to a sunny veranda. Pillow-banked and shaded under a gaudy Mexican blanket strung between two columns, she gazed out over the broad acres that are hers only. What she saw was a herd of sleek Brahma steers, with nubs for horns, browsing over a meadow of Bermuda grass. They filled the picture which, thirty-five years ago, from that very same hillside, had been occupied by a certain lank, stringy, rangy animal grown not to meat but to horn. It was progress, too. As Mr. Kleberg had said, the cowman who goes out to meet the changing order need not fear the future. His business is secure, and will remain so as long as the human family eats meat and uses leather.

CHRONICLER OF THE NEGLECTED TRUTH

Mr. Sapiro Speaks for Himself on Witness Stand

His Testimony Before Royal Grain Inquiry Commission at Winnipeg

Aaron Sapiro is one of the luckiest men in the United States, but he runs true to racial form by crying "persecution" whenever his plan is challenged.

It is not because Aaron Sapiro is a Jew that his system of co-operation is being analyzed in The Dearborn Independent for the benefit of American farmers—although it is rather amazing, when you come to think of it, that four Jews suddenly bob up in the United States announcing themselves as saviors of the farmer! If they were four Chinese or four Armenians or four Hindoos it would be just as amazing.

When one of them, unknown before, appeared as chief of everything during the war, when another comes into view as chief of the Government department which says which groups of farmers shall and which shall not benefit by government loans, when another happens to be the chief merchant for all the country towns of the United States, and another the organizer of American farmers into a system that is splitting the co-operative movement and aims at a World Trust of food producers—*when all the key men of this movement are Jews*—it is a fact of sufficient interest, and it may be of sufficient importance, to attract attention.

If four Jews have conceived a plan more beneficial to everybody concerned than all the other farm leaders have been able to do, that is an important matter. Quite regardless of its racial origin, every system must be measured by its merits.

Aaron Sapiro cannot hide behind his "persecution" cry when it comes to a discussion of

(a) the merits of his plan and

(b) the history of its operation wherever it has been adopted. Jewish or Gentile, it must stand or fall on these points.

The amazing fact that the world-wide organization of the farmer is purely a Jewish idea gains further interest from the Twelfth Protocol which states:

> "Our calculations reach out especially into the country districts. There, we must necessarily arouse those interests and ambitions which we can always turn against the city . . . . It will be necessary for us before we have attained full power to so arrange matters that, from time to time, the cities shall come under the influence of opinion in the country districts, that is, of the majority prearranged by our agents."

Of course, there may be nothing in all this. In which case the Jewish interests involved will not object to its being mentioned because they will have no difficulty in explaining it satisfactorily to Americans.

In fairness to Aaron Sapiro, we shall let him speak for himself. The testimony quoted here was given before the Royal Grain Inquiry Commission, sitting at Winnipeg, Canada. Sapiro had gone to Canada to put over his plan of co-operation among the wheat growers of the Canadian Northwest. He made numerous speeches in which he sometimes expressed himself extravagantly—he is a master on the platform. This examination by the Royal Commission is preferred to the speeches for reasons of greater presumed accuracy of statement.

The Chairman: Call Mr. Sapiro.

Mr. Aaron Sapiro called, sworn and examined.

The Chairman: Are you of Chicago, Mr. Sapiro? What is your address?

Witness: 3400 Sheridan Road, Chicago.

Q. By Mr. Woods: Mr. Sapiro, we have had the opportunity of reading, some of us of hearing, your general statements on the subject of co-operative marketing; and it may be assumed therefore, that we are familiar, generally speaking, with the way in which you have presented the matter from the platform. Consequently, our time being valuable, you will understand me if I limit myself to inquiring from you as to certain of the matters that the plan raises that have suggested themselves to me, for the information of the commission. I suppose you are familiar with the general nature of what this commission is investigating.

A. Just very generally.

Q. The order-in-council of the Federal Government appointing the commission to investigate very broadly and generally all matters connected with the western wheat crop, one of which is the marketing of the crop; and inasmuch as the plan of co-operative marketing that we have heard of from you, among others, is of considerable interest in that regard, we have asked you to come and give us an explanation of some of the matters that have occurred to us . . . . Now you are generally familiar, I suppose, with the present marketing system of Western Canada grain?

A. Oh, it pretty nearly parallels the experience we have had in the United States. I know that fairly well.

Q. There is, first, the gathering in of the crop in bulk, through a country elevator system?. . . . After the crop is gathered in through the country elevator system, it is transported by the railway system to a central market. A. I know your system.

Q. The elements of it being, first, the gathering in; the second place, the grading in that central market, or classification of it, and the disposal of it by agents of the producer at that central market; the third being the storing of it at the terminal elevators where it is to be shipped; and the fourth being the exporting of it to the seaboard and from there to its market. It is quite clear that these various steps in the marketing of the product all entail certain expense. That is right? A. No question about it.

No Saving in Handling

Q. No question about that. We cannot do things for nothing. No, what I would like to get from you, as tersely as you can put it, is what one or more of those elements, if any, does the co-operative marketing plan, as suggested by yourself and those who are advocating it, look to eliminate? That is, the expense of what portion of any one or more of them does that plan look to eliminate?

A. Now, I should like to ask for the privilege of answering that particular question in my way, because this whole subject of co-operative marketing is a controversial subject. Great groups of persons are in conflict on it, because it directly affects the pocketbook interests of different groups.

The Chairman: Yes, go on.

Witness: Now, that question that you asked is really one of the things that are put out in controversy—not, of course, by you—but by others—in order to cloak the real purpose of co-operative marketing. *We have no interest whatsoever in suggesting that there will be even a tiny saving in expense in the physical handling of grain* . . . . But the people who advocate co-operative marketing never come out and state that the purpose of the co-operative marketing movement is either to change or to eliminate any of the factors in the so-called physical handling of wheat. Our purpose is totally different.

Q. So then, I may take it then that the essence, if I may put it that way, the pith and substance of the pool conception is the holding of the crop by a pool or trustees for a pool, so that the crop may be fed to the market as the market will absorb it, to the best advantage of the producer from a monetary standpoint?

A. I think generally that is the correct idea, but I would like to phrase it this way; there are two different viewpoints toward the grain industry. With one viewpoint we keep our eye on what the producers are receiving. With the other viewpoint we simply keep our eye on what the Trade is getting . . . . Now in the United States that was recognized a great many years ago, and so our farmers at that time started in to organize the co-operative elevators, as they called them, on the Rochdale plan. Those elevators were organized exactly like the individual elevators were organized at the start in the entire Dominion of Canada.

Q. Based on the Rochdale system; that came from the co-operative.

A. Unfortunately based on the consumer co-operative system instead of being based on the producer co-operative system. They did one or two good things. They stopped frauds as to grades, and gave local selling points where the farmers had no local selling points before. They did those two good functions, but they were unable to do anything, when you come right down to it, toward the primary problem of raising the price level of grains; because all they did was to afford a place where a farmer would bring in his wheat and sell it to the local elevator at the current market price. Then the local elevator, in order not to take a loss, would resell it as fast as it could; so that your local elevator simply became a sort of a local commission house; it had nothing to do with controlling the flow of the supply of that grain, and therefore had no effect in raising the market.

(Witness enters into lengthy history of pools, grading, minimum contracts, and so forth.)

Q. Our time is limited, and I have to allow other parties to examine you. I do not want to take up more time in examining you than is absolutely necessary.

A. I understand that, Mr. Woods, but I would not answer any questions without the privilege of likewise explaining the background of the movement, because I have been warned in the public prints of the type of question that is lying for me, and I want my background laid, if I may.

Laying a Background

Q. You need not worry about the type of question.

The Chairman: I think we had better go on for a while.

Mr. Pitblado: I do not want any speechifying here this morning.

Witness: I understand Mr. Pitblado objects to speechifying, but I do insist on the background being laid if I am to answer any questions.

The Chairman: Go on, lay your background.

(Witness continues as before.)

By Mr. Woods:

Q. The question that I asked is whether the pith and substance of the pool idea, as suggested by you and those who think with you, is or is not—whether I am properly expressing it by saying that it is a feeding of the market by that pool through its trustees with the purpose of keeping up the price of the grain to the producer.

A. Put it in another way. It is for the purpose of keeping in the hands of the producers, instead of putting in the hands of the Trade, the control of the flow of grain as to quantity and to value.

Q. Well, then, that is another way of putting the same thing. Now you do look, as I would take it, from what you stated, so far as the marketing of the Western Canada grain crop is concerned, to an initial advance to the producing member of the pool when he delivers his grain.

A. You mean what you call an advance payment? Yes.

Q. And you have to have money to make an advance payment. A. May I just interrupt? You don't mean when you are starting a pool. You mean when you are starting the handling of wheat under the pool; because they are *two distinct financial problems.*

Q. Now, then, you look to giving the producer of that grain a certain amount. Where does that money come from or where is it contemplated to come from?

A. If the price of wheat is very high, then the percentage that is paid as an advance payment is low. If the price of wheat is low, then the percentage that is paid to the farmer as an advance payment could range anywhere between seventy-five and eighty-five per cent. Now we get the money in the United States—and in a minute I will state where it is contemplated to get it here—first from local bankers, if the local banks have funds on hand with which to do it. That is not the case in most instances, because *the banks in the producing sections are not the heavily capitalized banks in the United States.* Where we cannot get enough money there, we go to New York banks or Chicago banks or banks in Boston or Philadelphia.

Q. All right; I just want it generally, you get your money from banks.

A. And borrow generally from them. *We go to two government institutions, one of which is the War Finance Corporation, which is still empowered to lend money to the Growers' Co-operative Association; or we go to the New Intermediate Credit Banks, which have been set up under the Federal Farm Bureau of the United States in different districts*, and which likewise are entitled to advance money to co-operative local associations.

Q. Now will you come to the point where you expect or look to get money in Canada? A. In Canada your banking system is different from ours. From a good local banking system, we would expect the Canadian banks to advance these pools so much a bushel on the wheat delivered at approved elevators either at country points or at terminal points. If the Canadian banks are not prepared to do that, American banks are prepared to do so.

Q. What I am getting at is that the money that comes from this initial payment is to be provided in Canada by banks who lend on the security of the grain on a certain margin. That is the way? A. Yes.

Q. How are they going to keep their margins good if the wheat drops?

Making Good the Margin

A. That is always the question asked by every banker to whom this is first presented. You see these are not holding associations; they are selling associations. The attempt is never to hold the crop so as to get the top price. The attempt is to sell the crop slowly so as to get the average season's price without breaking the price in the autumn. Now we are making sales all the time. Take, for instance, as we are doing in the United States with cotton, which is an exact parallel. We make sales, and we get in a certain amount of money—about the loan value. We pay off a pro rata of the loan as it is sold. The balance of the money we keep in the treasury, so that we constantly have on hand additional cash as additional collateral to the loan already made. So, as the thing goes, we are increasing the margin for the banks and not taking a chance on the margin going below the so-called sale value.

Q. The time the grain is coming on the market and the initial advances have to be made, is not the proper time from the standpoint of the producer to sell the grain? A. Always do some selling. They always sell all the time. It is simply a question of how much you are selling.

Q. Then it is quite obvious that you have to have money to make that advance? A. Surely.

Q. You have to take it on the security of the grain unless you have some government behind you? A. Certainly.

Q. But it still stands that the amount which you have to sell, either at the instance of the banks, because the margin has dropped, or otherwise, depends upon whether the price of wheat goes on falling or not?

A. You mean that you might sometimes have to sell a good deal more in order to meet conditions? Of course.

Q. Now I think that is candid. We will say that this pool is handling—which is not out of the way—a hundred million bushels of grain, and we will say that wheat drops from these accidental circumstances two cents a bushel, basis 1 Northern. That is a good big drop, I grant you. A. Yes.

Q. That is a good big drop, but at the same time—

A. That would not affect your collateral. A drop of that amount would not affect it.

Q. But it matters not for my purpose whether the bank or financial institution takes a certain risk down to a certain margin or not; there theoretically may come a time below which—A. Theoretically there may come a time—let us put it this way—when the market price will go down from a dollar to eighty cents, or will go from a dollar to seventy cents. The chance is not likely, but for the purpose of your question, which I anticipated, let us assume these facts.

Q. It does go below the safety point, to a point where the financial institution, whatever financial institution it is, says to you, "Make good your margin." A. The question is, where will you get your money, and what will happen to the bank?

Q. No: pardon me; I would rather put my question. The question is, I gather from you, that you have to then sell your grain in order to make good your margin?

A. You would not be able to do it even by selling your grain, if it went down to seventy cents, and if you were then to dump a hundred million bushels on the market it would send it down further, and you would not be able to get eighty cents out of a seventy cent market, so both your producer and the bank would lose. In that event they would lose.

Q. So what I am getting at is this. To be quite safe, to implement their tacit undertaking with the producer, namely to hold his grain for the best market—

A. I must stop that. It is not the purpose of the pool, and I was very emphatic in saying that the purpose of the pool is not to hold wheat for the top market or for the best market.

Q. Well, put it for the average market.

A. It is not to hold grain at all. It is to do orderly marketing of grain by constant selling, but without dumping at the seasons when the market is already overloaded.

Q. At all events, it is a tacit understanding that it won't be put on at a time when the market is at its lowest ebb and is falling?

A. Oh no; we don't pretend to be prophets. We do not pretend to know what is the lowest ebb. We sell on all markets, even falling markets, but we do not sell a half or three-fourths of the grain on a falling market.

Q. You would have to make your initial advance to the farmer at such a point that there would unquestionably be no chance whatever of the margin having to be called on. That is a proper synopsis of your statement.

A. I would say, no reasonable chance. That is the very method we have used in the United States.

Q. And which has proved successful?

A. *No bank has lost money.*

Q. The Chairman: You say no bank has ever lost money in the United States?

Witness: Not on these commodity co-operatives. None that I know of. And I represent the majority of them.

By Mr. Woods:

Q. The next fundamental thing I had in my mind in thinking over this matter, as being a thing I would like to hear from you, is this: Having regard to what I have described as the pith and essence of the pool idea, that is, the keeping of the price up, at all events an average fair even price all over, and getting a higher price for the product, is it or is it not necessary and essential to the full accomplishment of that purpose that there be not merely a pool in Canada, but also that allied to the pool in Canada there be a pool in the other wheat producing countries that might compete with Canadian wheat?

A. I will explain that in this way: If there were a pool formed in any one of the provinces of Canada it would have some good effect on the market. If there were a pool formed in each of the three provinces, and if those three pools were to get together and form a dominion pool, it would have a larger effect in stopping dumping and in helping to give the basic price a chance to raise itself. If, in addition to that, the pool in Canada were to unite with a similar pool in Australia and New Zealand, and were ultimately to unite with a similar pool in the United States, it would have a still greater measure of success in helping the basic price of wheat to be raised to a reasonable level. In each one of these instances they would have a measure of success dependent upon the field in which they operated.

Q. Then it would be necessary to the complete success of the pool idea, a fully organized marketing system, that the pool should be allied with pools in the other countries that produce grain in competition with or that might compete with Canadian grain?

A. No. I would not say that at all, unless what you mean by "complete success" is a condition where the farmers actually name the price for wheat—which I do not contemplate at all.

Q. You do not then contemplate the complete joining up of these pools?

A. Not under our present human conditions. I think we will be able to get three or four countries together in the period of a few years.

Q. That is in an international pool? A. Yes.

Q. What three or four countries?

A. I think it would be possible to get Australia, to get the Canadian crops, and to get the better crops in the United States, and perhaps the Argentine.

Q. You think that that would be a possible thing, to have those controlled by one selling organization?

A. No, just simply the export surplus of each one of those four countries to move through a common channel at Liverpool and on the Continent.

Q. And be sold by one selling organization? A. Yes.

By the Chairman:

Q. When you say, "a few years," would you give us an idea of what you mean by that?

A. I do not want to be a prophet. In Australia they already have made a start. In the United States it will probably take a bit longer on account of the confusion caused by the McNary-Haugan Bill. It will take us in the United States, I would say, at least five years to complete a co-operative pooling of grain there. In the Argentine it all depends on whether or not there is government action, because some of the men who have been in my office were intending to go back and urge the Argentine Government to create wholesale government pool. That might be done in a year and might take two years. I should think it would take a period—it may be done in one year, to united Australia and Canada. It would take from two to five years to get these four countries together.

By Mr. Woods:

Q. I find in the Winnipeg paper of the twenty-second of February, an account of the debate or speech that you made in Saskatoon. I want to see if you are properly quoted, because it is because of my reading this that I am asking you this question. It says: "Mr. Sapiro said that pools can hardly operate in Manitoba and Alberta unless Saskatchewan comes in"?

A. Well they can operate but they cannot be enormously effective in Canada without Saskatchewan. Saskatchewan is the heart of the wheat problem in Canada.

"Over the Hills to Tut's Tomb"

A Visit to the Valley of the Kings

By LEONORA RAINES

DON'T think that you can roam along the desert, find the Valley of the Kings, pick out the tombs, and wander into that of Tutankhamen. You might as well attempt to have a chat with President Coolidge when he is holding an important Cabinet meeting. The priceless hole is guarded by soldiers and the door is not ajar.

To begin at the beginning: If you have permission from the Cairo Minister of Public Works, and Mr. Howard Carter—who is a temperamental sort of a person—does not postpone the date set for your visit, and if no accident has happened in the "hole," you may count on getting in. The men in the tomb can work only a few months of the year on account of the excessive heat of the desert, and during their season there must be few interruptions.

We leave Luxor early because a visit to the valley takes the entire day. The weather is good, for January has passed. It may be windy and cool, but the sun is shining, and that gives life to the scene and animation to the excursion. Blithely we step into the boat which is to convey us across the Nile, for the ancient city of Thebes, once the stamping ground of the Pharoahs, is on the other side. We take seats and the Arabs grasp the oars, shove off the mud-banks, and we begin to cross the current of the river.

Listen to our sailors! They strike up a song that is neither musical nor beautiful; only unusual. One man gasps out a note in a minor key, and the other answers—an eternal repetition that calls for an eternal response. Each tug at the oars brings the sound, and the men take their tempo from their oars. They are saffron-hued humans, bare of foot and leg. Their galabeiha, which is clean, is in ribbons. But their faces are innocent and their smiles infectious.

As we near the banks, tiny Africans who await their clients come dabbling out. The babies—they seem to be but a few years old—are in crafts made of tin boxes. The youngsters paddle with their hands, occasionally halting to bail out water. They're naked, the little fellows, and their ebony bodies so thin that the poor baby ribs may be counted.

No fear of drowning, for the water is shallow. The boys come nearer us, grin at the passengers, hold up faces with lips spread, displaying white snaggled teeth. The grin is for a gift, of course.

"Bakchich, leddies, bakchich."

"Leddies," is the only word they know outside their Nubian patois, but the word earns them a living. Each child catches a rain of piasters, and they paddle back happy, jubilant of their success. They run to shore to assist at our landing, wet, naked bodies, grin and all, for the piasters have made them our slaves for life.

Having rowed the boat as near shore as they can, our sailors roll up their clothes, fold their galabeiha about the waist, and make a seat of their hands.

"Leddies fust," they call, proud of their English.

The first lady hops on. Feminine charges deposited on the shore, the sailors motion to our men. The Arabs make a wry face as the heavier burdens fall against their arms, but manage to get through, landing all passengers. We hurry across the sands where carriages, camels and donkeys wait ready for customers. As part of the road is rocky and the reflection of the sun strong, we take a surrey with a fringed top—a turnout that would merit a laugh were it not for the Arabian steeds that pull it.

For a distance we skirt the river. Gorgeous flowers abound everywhere—bursts of poinsettias, splashes of bougainvillea, touches of acacia, fields of poppies. We go through farm lands where the fellah stoops amid his grain or lies at full length in the sun, his turban undone and doubled over his face. Women work there too, without a veil, for the peasantry has been the first to discard the face muffle. Other women, up to their knees in water, are washing clothes in the Nile.

The water wheel which brings up the water to irrigate fields just as it did thousands of years ago, is still to be seen. The small boy who attends his gamoose and sees that the plodding creature doesn't fall asleep at her job, glances a moment at the travelers in their cloud of dust, and lapses into dreams again.

It is Monday, market day, and scores of natives are on their way to town. It is like a crowd that might be passing into Noah's Ark. The entire procession seems biblical, even to the faces of the people, for to judge from old frescoes and carvings, these are just the same as they were in the days of another age. We see Jacobs and Isaacs, many, some on camel and on donkey, some afoot, toiling along with staves in hand. There are Ruths. There are sweet-faced young women on donkeys, infants in their arms, men walking alongside—for all the world like representations of the Holy Family and its flight into Egypt.

The entrance to the Tomb of King Tutankhamen.

There is something uniquely appealing about the crowd, and uniquely sad. The people are of one type and one sympathy, but we feel that they have been the oppressed of the earth and that they know it without resenting it. Some of the women carry great burdens on their heads. They move along superbly erect, with a grace which is achieved only by carrying weights on the head and balancing children on the shoulders.

As we turn into the Lybian Desert, the Nile, highway of Egypt, fades out of sight. Then the solemnity of the Valley of the Kings is upon us. Mountains of sand dunes that look like dead waves lie around as far as the eye can see. Miles in advance are cliffs that suggest the Palisades of the Hudson. The Egyptian Palisades are yellow. Above is the blue sky, fading into violet. Kites which have pursued us from Luxor and pierced the air with their cry, have left us to accompany other travelers bringing up the rear.

Now that we have left the glutton vultures behind, there seems nothing living about. The horses have slowed down. Silence has fallen, for not only the spell of the desert is there, but the epoch when the mighty Pharoahs lived their prehistoric lives. A ghostly uncanniness is in the air.

The Valley of the Kings at last. No one speaks. We feel that we are in a great cemetery, each pile of sand a grave, each cliff a monument.

The tomb of Tutankhamen is not so deep nor difficult to move about in as are others in the vicinity, nor are the walls so highly decorated. But the colors are alive and full of charm—preserved, it is said, by the identical temperature of the atmosphere century in and century out. There is one large chamber and one alcove, the latter evidently built to fit the sarcophagus.

The blue, incrusted, gold-mounted outer-casket is uncovered for us to view. It is as though the body had been placed there the day before, and was awaiting the final rites. Features of all the kings are accentuated in the head-plates, and this one is no exception. The great inlaid blue eyes, staring at the roof of the mortuary chapel, give one a shock.

The mummies of the two serfs, killed the day of Tutankhamen's death to be ready to meet and wait on him at resurrection, were in the next room, but have been removed; likewise the interior organs of the king's body, preserved in their own receptacles. These in due time will be placed in the Museum at Cairo.

The place is bare save for the sarcophagus, but the dismantling and opening of this has been left till the last. The rock surface of the rooms was covered by the ancients with very thick plaster, and this was indented to mark the colored pictures. There is an elegance in the roof and walls just as there is an elegance in the sarcophagus. It sets one marveling at the development and refinement of an age that lies dimly toward the world's beginning.

"Enemy Citizen" Worse Than "Enemy Alien"

What Must Be Built Into a Man Before He Becomes an American?

By ALBERT ERNEST JENKS
Professor of Anthropology, University of Minnesota.

Copyright, 1924

THERE seems to be a question in the minds of some persons as to the real meaning of "Americanization." Is it the legitimate word for a legitimate process? This paper attempts to answer the question, reducing the matter to its simplest terms.

We have admitted to the United States in the past forty years too many aliens of races not easily assimilated to American life. The nation is late in recognizing this fact. Our gates should now be closed. I emphatically urge this point. This is absolutely necessary if the fundamental character of our nation is to survive.

But when this is said, *there remains no excuse for the conclusion that there are so many aliens here already that they cannot be assimilated*, and that, in consequence, we must sit supinely by to await the tragedy which has befallen every government of unassimilated peoples. Since there is a great mass of unassimilated aliens in our midst, what is the legitimate process for hastening their assimilation?

What Americanization Is

AN AMERICAN is a person who is psychically alert and responsive to the life, ideals and interests of the American nation, rather than to the nation of his foreign ancestral past.

Americanization is the act, process or result of becoming an American. The condition of being an American is primarily a psychic condition, and is much more emotional than intellectual. It is not simply a physical or biological condition. Since being an American is primarily a psychic fact, the intellectual and emotional condition of a person in America is capable of change. The process of change, as it increases toward America, is the process of Americanization.

In countries which almost entirely breed their own inhabitants, as do England, Holland, Germany, France, Japan, and so forth, practically all residents are citizens who primarily react naturally toward their own nation. The case is different in America which has imported so large a per cent of its inhabitants.

The Americanization process often is not rapid. Any person familiar with aliens as intimate friends, or even as close acquaintances, knows many worthy men and women who have here encountered such conditions that America has not yet even begun to take the place of the Old Country in their emotional life. "What!" you say, "Not love America?" No, not yet—as a substitute for their motherland.

There exists in America today a body of largely unanalyzed powerful emotionalism, of dominant and compelling thought, and of dynamic idealism which constitutes our "Americanisms." Together as a whole these make up the "character" of our nation. These characteristic Americanisms distinguish us from all other nations. They are the product of our physical environment, of the peoples who founded our nation, of our history, and of our ideals which half lead and half drive us forward.

We must realize that Americanisms are not something an immigrant acquires in his homeland at the time he purchases his ticket to America. Neither are they bestowed on him by our courts when he renounces allegiance to a foreign government and receives his naturalization papers as an American citizen. One's Americanisms are beyond purchase, gift or will, and are not necessarily a birthright. Yet it is possible for a foreign-born American resident not only to acquire this asset of Americanisms, but to acquire it quickly. Many a person of foreign birth received such unjust treatment and found himself bound by such hard and cruel conditions of life in his motherland, and has been so fortunate in America, that he becomes almost at once an American. But this is not usual.

This matter of becoming an American is not simple. It is a very complex thing for the foreign-born, and has often been delayed until after three or more generations of American birth. We must be reasonable about it, because we deal with facts, stubborn facts, and most stubborn, since we deal much more largely with human emotions than with ideas to be learned or truths to be accepted. Many foreign-born parents and grandparents in America idealize their motherland, and pass on to their descendants vivid emotion-stirring tales of the old nest in Europe. I recall the statement of a superior woman whose parents were married before leaving Scotland for America where their children were all born. She said, after visiting the Scotch home of her ancestors, "I was greatly disappointed. It was not nearly so Scotch as my own childhood home where father and mother saturated our lives with tales and experiences of old Scotland."

I know of localities today wherein for four generations American citizens have been born, but are un-Americanized. Because of the culture of their home area there has been a continuity of Old Country influence practically unbroken by American influences. In the midst of an extensive nest filled with people of their own race, where they intermarry, and chiefly and preferably speak the mother tongue, and where their rural life is quite sufficient unto itself, they have remained un-American. Let us recall that some of our Colonial ancestors had been in America for one hundred and fifty years at the time of the Revolutionary War, yet the feeling for Great Britain was so strong with some of them that scores of American families were permanently split—many persons still swayed by Tory emotions left their kinsmen in the "States" after freedom was gained, and took up permanent residence in British possessions. Not a few thus went to Canada.

No. This thing called "Americanisms," or any other set of nationalisms, is not like a garment to be put off or on as we use our coats. It is a condition within the soul of a man. *But Americanisms may be attained.* Once attained, they are decidedly enduring. The point to be remembered is that the attainment of Americanisms may be very slow or it may be more rapid.

The Americanization process is that of assimilation. Assimilation is the psychic incorporation of the various peoples here into the then existing character of the nation. One is completely assimilated only when he is emotionally dead to all his foreign ancestral past and is emotionally responsive solely and wholly to America.

Because our Americanisms are the natural characteristics of our nation, if from now on we are wise and determined in guarding our gates, they have a far better chance to survive and to continue to characterize us than have the characteristics of any other group of people which has come to America. The natural character of our newer immigrants will be changed to an extent, and changed more than they can change the character of our nation. As always, there will be the natural struggle of the strong characteristics of our newer peoples to survive. Certain worthy characteristics and valuable contributions of each will survive. There will be artificial assistance given to help the survival of certain strong characteristics, and, similarly, there will be artificial pressure brought to weaken and destroy undesirable characteristics. But there is no reason now to doubt that the American nation of today will continue to contribute to the Americanisms of succeeding generations much more than will all the other groups now here. The contribution of any one group will be small indeed as compared with the aggregate of the national body and of the contributions of the other separate groups.

No group of aliens here has good reason to think it can run away with this nation, and there is no reason for believing that all of them put together can run away with it. Should they all try it, they would shortly find they were going in half a hundred different directions. Already we see our nation has a character so dominant that civilized nations can pretty accurately foretell what course she will pursue in any developing crisis. Is it not wise, then, for us all to unite in hastening the inevitable process of assimilation toward America's dominant character? It can be done. As has been said, the process will be slow, or more rapid; its rate of progress depends on us.

Because the matter is something definite and specific, the various factors which contribute to, or detract from, which hasten or retard the process of assimilation, may be determined with very gratifying definiteness. Consequently, it is possible to develop a *modus operandi*, that is, a technique, a method, a program, a trained personnel and organizations to hasten the assimilation process. This is what we mean by Americanization in its active sense, as the word is commonly used today. We are not attempting to do something to a man irrespective of his will, but to hasten a process that takes place in his own soul. And let it be emphatically stated that it is of imminent importance to America whether the assimilation of her aliens takes place with reasonable quickness, or is a slower process delayed for generations.

What the Americanization Problem Is

THE Americanization problem is one of building a nation out of the numerous and varied racial and cultural elements in America. The efforts to build nations have long been continued in different parts of the earth. As the pages of history are turned back, one sees three main types of reactions and results of the many efforts at nationalization:

First, they have had the driving force or prophecy, as in America at her best periods, when it would almost seem that our nation possessed superhuman qualities for widespread betterment and contentment among the foreign peoples here, and, consequently, for their assimilation.

Second, they have had the deadening effect of hopelessness when the morale of a resident people is broken by the irresistible, unsympathetic and heedless nationalizing forces in whose grip they are. The Jews in old Russia well illustrate this condition.

Third, they have had the inflammable effect of lawless and indiscriminate destruction, or of more ordered revolution, when spirited men in desperation have lost faith in the moral purpose and the integrity of those controlling the nation and shaping its policies. Illustrations here are quite innumerable. We have only to look at the face of recent history in old Russia with her Finns, in old Germany with her Poles, in old Austria-Hungary with her various Slavs, in Great Britain with her Irish, and in Korea under Japan, to know that men have never been nationalized at heart by force.

It need not be expected that America's effort at nation building will result in the deadening inaction of hopelessness. Hopeless men have seldom come to America. Most of us have noted that some of the peoples most repressed and submissive in Europe, in America quickly fill up with American ozone and expand to the bumptious extreme. Whether America's effort at nationalization is to result in the most desirable dynamic drive for the betterment of our nation as a unit, or is to result in lawlessness, in the destruction of that genuine happiness without which a nation must deteriorate, all depends on the spirit in which we attack the problem and the amount of intelligence we put into its solution. Just so far as our spirit of nation-building compels aliens to think in terms of oppression here or in Europe, or of racial persecution by the European governments from which they fled to come to America, just so far will it fail.

What, then, is the normal process of assimilation? Let us look at its most important contributing factors.

The most important factor in assimilation is *the desire for assimilation.* The assimilation of a person against his will is an impossibility. Past and contemporary history brings us no surer truth than this.

America has been fortunate in this respect. Most of the peoples who came to her in the earlier immigrations came determined to become American citizens. They deliberately planned to burn their bridges of historic and hereditary emotions behind them. Assimilation is immeasurably rapid when one's chiefest desire is to be considered at the earliest possible moment a typical American. When to this desire on the part of the alien there are added sincere good will and positive help by those already American, the assimilation process may become very rapid indeed.

Ignorance of Racial Values

IN THE deluge of the newer immigration many persons have come to America primarily for material gain, rather than because they wished to be Americans. We even have now in our midst those who deliberately and wilfully resist assimilation. America today has no place for such people. We have difficulties enough without them.

The first Americanization problem is twofold. First, to reach the wills of the great mass of the unassimilated in America and make them desire assimilation. And, second, much the more difficult, and upon which the first depends, to reach the wills of those already American and make them alert and active in sincere good fellowship toward the assimilation of the unassimilated. Only by these methods will true assimilation be possible. Of course, we might use force; an alien may be compelled to take out his first papers, and there are cases known of persons who, in order to continue to draw their salaries, were virtually forced to take their second papers. Such a procedure is woefully stupid, for what does it matter though one does forswear allegiance to the land of his birth and swears allegiance to the land of his salary, if he is still at heart an "alien"? An *enemy citizen* is many times more dangerous in our midst than is an enemy alien.

There is nothing unscientific about a deliberate attempt to educate the unassimilated toward America, and a deliberate attempt to educate the American in regard to the unassimilated. Anthropological knowledge of peoples is necessary in both cases: first, to acquaint the aliens here with the dominant character of the American people; and, second, to acquaint the average provincial American with the characteristics of the alien peoples in our midst. We are coming to realize today as never before that *one of the most fundamental and permanent facts of human life is race. The American is very ignorant of racial values. A weak sentimentalism keeps many Americans from scientifically evaluating the so-called races of man.* There is practically no limit to the extent to which such anthropological knowledge may be pursued. We have many Slavs in America. To venture out into any attempt to understand the soul of the Slav carries an American into far fields of scientific interest. If the non-Slavic setters-up of the new Slavic nations in Europe had made more such anthropological excursions, one might have looked with greater hope on the future of Europe.

The second factor in assimilation is *a common language.* There is no strong homogeneous nationalistic group which does not possess a universal means of intercommunication—a common language. It is no wonder that certain primitive peoples say that a man's talk is his life-force: "Live men have words; dead men have lost their words—they are dead."

In Bulgaria, under four hundred years of Turkish rule, Bulgarian literature was destroyed and the language was kept alive only by the women in the homes, a handful of monks, and the brigands in the mountains. But the very power of the force spent to uproot the language made it survive to blossom out as the strongest factor in the nationalistic revival of Bulgaria in the nineteenth century. It has seemed practically impossible to destroy by force a native language, but it is possible to help a people desire and acquire a new language.

The English language is one of the most important factors of assimilation in America. I wish we could say with national distinction the "American language." Many an alien in America logically says he wishes to learn the American language. But, though there are more than sixty languages and dialects spoken in America among our modern peoples, the language spoken by the majority is English.

And, since it was the natural linguistic survivor during those formative days when our national character was being shaped, it will continue to be our language in the generations to come as that character grows and ripens.

The English spoken language is decidedly memorable. Its sledge hammer blows delivered in short Anglo-Saxon words, or as longer words with stressed syllables of harsh consonantal sounds, seem to have an advantage all over the world today. Its harsh brutality makes it easy to remember—actually difficult to forget. Such a hold does its vigor have on the young, even the foreign-born, children of our immigrants that their mother tongue often becomes a thing disused, disclaimed and despised. The immigrants who learn in the streets or school the

A Red Ring Around Germany

The Most Expensive Country in Europe; Bavaria Has No Love for Foreigners

By H. H. ALLEN

—Munich, Germany

"CAN I travel in Germany this summer—or would it be wiser not to?" This is a question which the hundreds of thousands of American tourists who go abroad each year are asking. And having read columns of contradictory reports about the convulsions and putsches of the Reich, the adventurous American traveler is naturally curious to go over and take a squint at things for himself.

Well, the answer is: "You can travel in Germany this summer—but it would be wiser not to."

In the first place, Germany is the most expensive country on the Continent. During the time when the mark was tumbling daily and living in the Reich was phenomenally cheap for the man with stable currency, the German "hoteliers" fell into the astute habit of squeezing all they could out of the unwary foreign traveler. Now that the money is stable and prices are high, they can't quite get rid of the habit.

The result has been that foreigners living in Germany have fled pell-mell from the country. Italy, Switzerland, and France gladly received the tourists, especially Americans, whom Germany was unpolitic enough to alienate.

To aggravate the matter still further, the state demands enormous taxes from foreigners. In Berlin the municipal tax is fifty per cent of the hotel rate. In some smaller cities, especially summer resorts like Weimar and Eisenach, the rate goes as high as seventy-five per cent. By the time you have paid two or three dollars for a bare little room, plus fifty to seventy-five per cent for city taxes, plus thirty per cent for national tax, plus twenty-five per cent for "service," plus fifteen per cent for light and heat, you can readily see that traveling in Germany is a matter ot paying luxury prices without getting any luxuries.

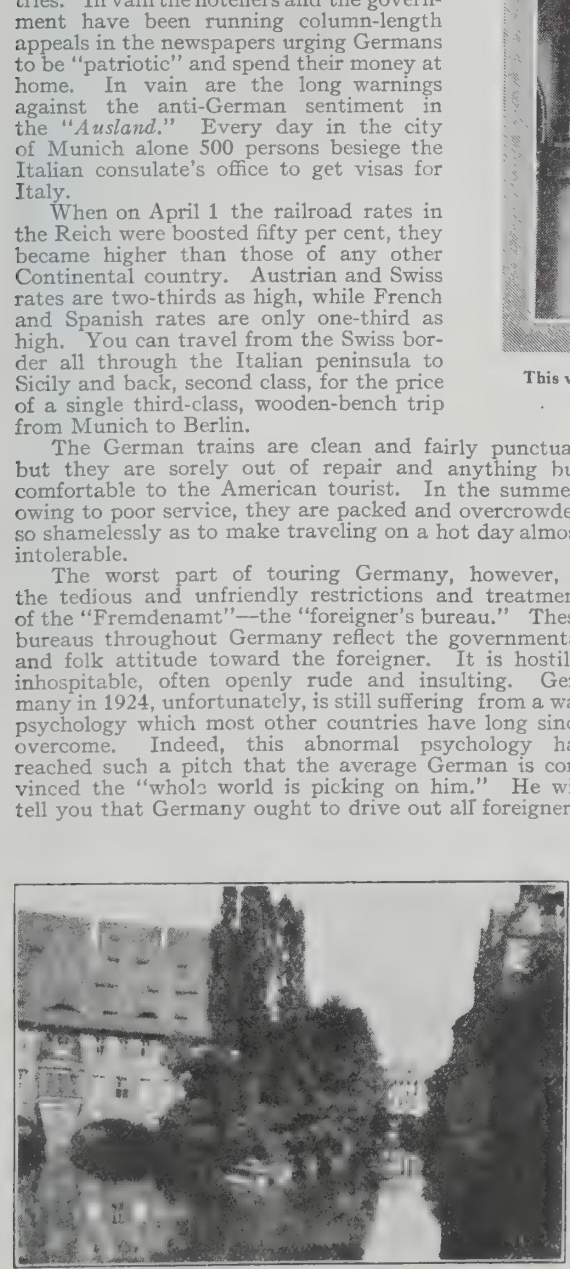
Meanwhile, in Italy, Austria, Switzerland, and France, hotel and pension prices are so far below the German current rates that there has been a swift exodus of German vacationists into those countries. In vain the hoteliers and the government have been running column-length appeals in the newspapers urging Germans to be "patriotic" and spend their money at home. In vain are the long warnings against the anti-German sentiment in the "*Ausland.*" Every day in the city of Munich alone 500 persons besiege the Italian consulate's office to get visas for Italy.

When on April 1 the railroad rates in the Reich were boosted fifty per cent, they became higher than those of any other Continental country. Austrian and Swiss rates are two-thirds as high, while French and Spanish rates are only one-third as high. You can travel from the Swiss border all through the Italian peninsula to Sicily and back, second class, for the price of a single third-class, wooden-bench trip from Munich to Berlin.

The German trains are clean and fairly punctual, but they are sorely out of repair and anything but comfortable to the American tourist. In the summer, owing to poor service, they are packed and overcrowded so shamelessly as to make traveling on a hot day almost intolerable.

The worst part of touring Germany, however, is the tedious and unfriendly restrictions and treatment of the "Fremdenamt"—the "foreigner's bureau." These bureaus throughout Germany reflect the governmental and folk attitude toward the foreigner. It is hostile, inhospitable, often openly rude and insulting. Germany in 1924, unfortunately, is still suffering from a war psychology which most other countries have long since overcome. Indeed, this abnormal psychology has reached such a pitch that the average German is convinced the "whole world is picking on him." He will tell you that Germany ought to drive out all foreigners, shut itself up from the rest of the cruel world, and remain aloof, pure, proud, and independent.

It is Germany's great tragedy that its people cannot understand that a nation squatting in the middle of Europe, surrounded by 150 other millions of people who are just as human and just as good, cannot today play a prolonged game of political solitaire.



Nuremberg possesses many ancient buildings, some of which are glimpsed in this peaceful scene.

As soon as you reach any German town or city, you must report to the police in person. Usually you have to wait several hours in a stuffy little hall, where petty, insolent bureaucrats, with a top-sergeant's voice and manners, quiz you in none too friendly fashion. You are seldom allowed to remain in any city more than a week or two, unless you wade through oceans of red tape and have the most pressing of reasons. When you leave the city you again have to report to the police for "Abmeldung." Both "Abmeldung" and "Anmeldung" leave your pocketbook considerably thinner. And the minute you hit the next town, you have to go through the process all over again.

Among the simple people the hostility against foreigners arises from the belief that they are "buying out the country for nothing." Every time a boat lands in Hamburg or Bremen the people on the street say: "Here comes another load of rich Americans to buy us out cheap." They will tell you that England sent over all her unemployed to buy clothing and food in Germany, and that Dutchmen and Czechs swarmed city-wise into Germany to buy up "half a dozen sewing machines' or "five pianos at a time."

This view of Munich shows one of the busiest parts of the city with some of its public buildings.

That these reports are stupid and false is obvious the minute one examines the export restrictions and taxes, which are so formulated in Germany as to make sure that the foreigner cannot leave the country with anything valuable. The amount of money, the amount of baggage, and the amount of clothing one takes in and out of Germany are so regulated that invariably the foreigner leaves with considerably less than he brought in.

Furthermore, it has never apparently occurred to the Germans that, even when the mark was low, nobody but an imbecile would pay from $500 to $1,000 to travel to and from Hamburg to save a few dollars on a pair of shoes, or a vase, or an overcoat he might possibly smuggle out. They were too shortsighted to see that foreigners who left their stable currencies in the country were leaving a reserve which eventually enabled Germany to stabilize her mark.

But now the mark is stable and the stores have tagged on super-American prices. Has the attitude toward the foreigner changed? Not an iota. The dull-witted German masses still work on the theory that every stranger who crosses the borders must necessarily be trying to "buy us out cheap"—although in the next breath they will tell you that Germany is the most expensive country in the world. How the foreigner can buy cheaply where the German cannot; or why the foreigner should buy articles in Germany when he can secure them in better quality for less money in his own country—without being insulted into the bargain—are questions that have never entered the German's head.

Most of this sentiment, in fact, is being cooked and served to the German people by the fiery nationalists who realize that the world will not tolerate the pre-war Germany they wish to restore. By stirring up intense sentiment against the foreigner and urging the German to disregard and scorn the opinion of the rest of the world, the nationalists hope to oil their way back into power. The youth of Germany, in particular, is being trained by nationalistic leaders to believe that the world outside the Reich is cruel and wicked and wrong, and that anybody who doesn't belong to the "clan" should be scorned and driven out of the country. This is what they mean by the "Reinigung"—cleansing—of the "Deutsches Volk."

Bavaria has some beautiful cities, such as Rothenburg, of which this picture is highly characteristic in its quaint artistry.

In nationalistic Bavaria, the perfervid stronghold of the deified Ludendorff and Hitler, the anti-foreign sentiment is strongest, and police restrictions most cumbersome and stupid. Bavaria has some beautiful cities, such as Nuremberg, Rothenburg, and Munich, and its Alpine scenery is among the loveliest mountain landscape in the world. But you want to mark it off on your map with a big red circle as a perfectly fine place to avoid!

At least, Bavaria isn't altogether safe today for the foreign tourist, and won't be for several years until its outlook becomes a little broader and infinitely more sane. That this will sooner or later happen is inevitable. The Bavarians seem temporarily to have forgoten that, unlike the rest of Germany, their state is not industrial and depends for the larger share of its income on tourist trade, much like Switzerland and parts of Italy. When, during the next two or three years, the Bavarian nationalist discovers how essential to his daily bread the foreign traveler really is, his patriotic ardor is scheduled for an abrupt cooling.

Not only does one require a special visa to enter Bavaria, but here the fees for spending a few days in any city or town are most exorbitant. While it is true that a large number of Americans came to Bavaria to see the Oberammergau Passion Play in 1922 and the Wagner Festival in 1923—a fact which the Bavarian never fails to quote as evidence of the "buying-us-out" theory—it is also true that Americans always toured Bavaria in large numbers even before the war.

In Munich alone before the war there was an American colony of artists, students, and bonvivants numbering about 8,000. In 1923 there were scarcely 150 Americans living in Munich, and these were held by business duties. Still they were pointed out noisily by the "Muenchner" as examples of the heartless greed and covetousness of the American people who were supposed to be "flooding all Germany and living like millionaires on nothing."

So keen is this benighted hostility to the "Sau-Auslaender"—foreign swine—that travelers are frequently insulted and even attacked on the streets of Munich for speaking in a foreign tongue. A delegation of Italian students who toured Germany with an eye toward relief of their northern fellow-students were pelted with stones at the Munich station because somebody "thought they were talking French." An American professor who came to Munich with $5,000 for relief was called a "Sau-Auslaender" and insulted because he spoke with a foreign accent. An English journalist at the Hitler trial was asked by a German colonel what he "meant by talking English in my presence."

As a result, what was once a gay, free, cosmopolitan city has now become a provincial town, narrow-minded, complacent, shortsighted, and ignorant. Oswald Spengler, the celebrated German author of "The Decline of the Occident," summed up the situation patly when he declared that the nation had fallen into the great danger of "being too much concerned with its own church tower." "By one stroke," he added significantly, "we have become a province. We no longer know what is going on in America, or China, or England. Worse, we don't even care to know. It is a dangerous sign that Germany has become hostile to foreigners."

An American journalist recently told a German passport official that practically all other countries were gradually lowering the barriers and welcoming foreigners, in the hope of re-establishing a sense of trust in Europe. When would Germany follow suit? Here is his reply:

"That letting-down-the-barrier stuff may be all right for other countries. They need foreigners. We don't. We don't want them here. We're going to keep our fees as high as we can. Last year we were 'verlottert'—dumped—with 'Sau-Auslaender.' This year we've got to keep Germany clean."

And before you decide to go to Germany, you want to think over his words.

The Soldiers' Home—Where Lincoln Stayed

When the Sergeant Called the President an "Old Fool"

By STEPHEN POOLE

SITUATED about three miles from the business district, in the residential section of Northwest Washington, is the United States Soldiers' Home—one of the beauty spots of Washington. It was at this home that Abraham Lincoln wrote the second draft of the preliminary Proclamation of Emancipation. Of the countless thousands of tourists who annually visit the nation's Capitol, only a small percentage visit the Soldiers' Home.

The home is for soldiers of the Regular Army, and was established in the District of Columbia, March 3, 1851.

General U. S. Grant, in his Memoirs, gives an interesting note in which he says:

"It had been a favorite idea with General Scott for a great many years before the Mexican War to have established in the United States a soldiers' home, patterned after something abroad, particularly, I believe, in France. He recommended this uniformly, or at least frequently, in his annual reports to the Secretary of War, but never got any hearing. Now, as he had conquered the state, he made assessments upon the different large towns and cities occupied by our troops, in proportion to their capacity to pay, and appointed officers to receive the money. In addition to the sum thus realized he had derived, through capture at Cerro Gordo, sales of captured government tobacco, and so forth, sums which swelled the fund to a total of about $220,000. Portions of this fund were distributed among the rank and file, given to the wounded in hospital, or applied in other ways, leaving a balance of some $118,000 remaining unapplied at the close of the war. After the war was over and the troops all home, General Scott applied to have this money, which had never been turned into the Treasury of the United States, expended in establishing such homes as he had previously recommended."

(C) Harris & Ewing

Anderson Cottage, U. S. Soldiers' Home, where Lincoln resided during part of his stay at the home.

The organic Act of Congress, creating the Soldiers' Home, appropriated for its support the sum of $118,791.19, which was probably the residue of the tribute levied by General Scott. This Act also appropriated $54,136.00, which was the unexpended balance of an appropriation made for the benefit of discharged soldiers who were disabled by wounds. The Act further provided as a perpetual revenue for the home all stoppages or fines adjudged against soldiers by sentence of court-martial, over and above any amount that might be due for reimbursement of the government; all forfeitures on account of desertion; all moneys belonging to the estates of deceased soldiers, and unclaimed for three years (the latter to be repaid to legal heirs on demand); and that twenty-five cents a month be deducted from the pay of soldiers in the army. In 1859 this amount was reduced to twelve and one-half cents a month, and was finally repealed by Act of Congress approved May 11, 1908.

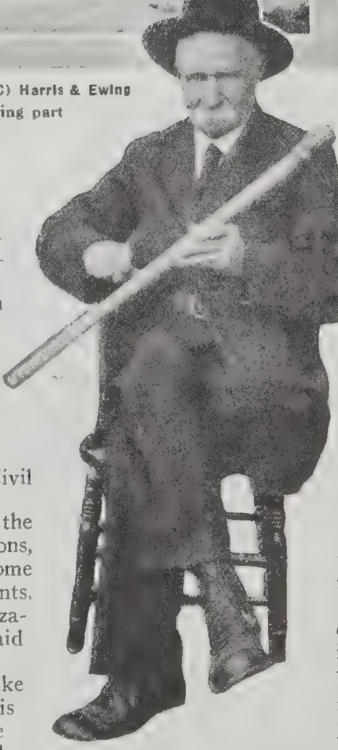
The home is equipped with handsome buildings, with all modern improvements. The spacious grounds are traversed with beautiful drives, many of which command excellent views of the city, the Potomac River and the surrounding country.

The grounds consist of about 501 acres. To this, in 1872, was added the adjoining estate of "Harewood," containing 191 acres. About 150 acres of the estate are used in the cultivation of farm products, the larger part of which are consumed by the needs of the home. The total cost of the land amounted to $326,193.34, and the buildings have cost upward of $5,000,000.

To those who have wondered what became of the soldier who served the better part of his life in the Regular Army, and was then retired upon pay that would probably not take care of him in his old age, the answer is—the Soldiers' Home. Here he is assured a home of all modern comforts and conveniences, the best of medical care, and ample protection against all the uncertainties of civilian life. Beneficiaries of the home are supplied with uniforms, subsistence and medical attention.

The benefits of the home are not extended to any soldier in the regular or volunteer service who was convicted of crimes of a civil nature after his admission into the service of the United States; neither will a deserter, mutineer, or an habitual drunkard be received, without such evidence of subsequent service, good conduct, and reformation of character, as is satisfactory to the commissioners. The home has a maximum capacity for 2,000 beneficiaries. However, there are at present only 1,386 beneficiaries on the roll. This number is classified as follows: Served in Mexican War, 1846-1848, 1; served in Civil War, 171; served in Indian wars, 308; served in Spanish-American War and Philippine Insurrection, 660; served in China during Boxer uprising, 1900, 17; served in World War, 115; without war service, 94. Ages run from 92 years for Mexican War service, to 47 years for veterans of the World War. The average age of Civil War veterans is 79.

A great many of the beneficiaries of the home are distributed in other institutions, when their state of health requires. Some are in institutions for tubercular patients, and some few are cared for at St. Elizabeth's Hospital. All expenses are paid from the funds of the home.



E. A. Buck, U. S. Soldiers' Home, who carves the Lord's Prayer on a walking stick.

"All play and no work" does not make Jack "a dull boy," in this instance. It is generally conceded that the men have labored long enough. They have served their country well. However, there are many things to occupy their time. Among the various amusements provided the members of the home during the past year were the gymnasium and facilities for playing pool, billiards, chess, checkers, and shuffleboard. The motion pictures, however, continue to afford the members the most-liked form of recreation. Particular care has been used in the selection of the reels and shows provided. The home also has its own band which, during the summer months, gives six outside band concerts each week. During the winter months five concerts are given weekly. A chapel with a seating capacity of approximately 150 is attached to the home, and is used by all denominations. Two chaplains are provided, one Protestant and one Catholic. All members who die in the home are buried with military honors in the national cemetery which is really a part of the estate, and just across from the administration buildings. This cemetery was used for the first burials of soldiers who died in the hospitals and on the battlefields around Washington during the Civil War, and was continued to be so used until interments were authorized to be made at Arlington. The only vault in the cemetery is rather a pretentious one, and is that of Major-General John A. Logan.

The library contains more than 15,000 volumes of well-classified books and more than 100 periodicals.

At the Soldiers' Home every battle engaged in by the American Army since the Mexican War is refought. Which is the greatest fight in our national history depends entirely upon which veteran you are talking with. However, veterans of all wars have a decided respect for Gettysburg.

There is a period in the history of the home when Abraham Lincoln made it his summer White House. If you approach a group of veterans and inquire as to which building Lincoln occupied, one will probably point out the governor's quarters, while another will point out the Anderson Cottage.

The artist, F. B. Carpenter, who painted the "Proclamation of Emancipation" which was purchased by Congress for $25,000, in his book, "Six Months at the White House," speaking of a conversation with Lincoln, said that the President, after writing the Proclamation, had waited until he heard of a Union victory before making it public. Carpenter quotes Lincoln as saying: "Finally, came the week of the battle of Antietam. I determined to wait no longer. The news came, I think on Wednesday, that the advantage was on our side. I was then staying at the Soldiers' Home (three miles out of Washington). Here I finished writing the second draft of the preliminary proclamation; came up on Saturday, called the Cabinet together to hear it, and it was published the following Monday."

This clearly shows that Lincoln was staying at the Soldiers' Home in 1862 and that he did some work there on that famous document. An examination of records, with a view of ascertaining just which buildings at the home were occupied by certain officers, indicates that Lincoln was living in the governor's quarters at that time. Also, certain alterations in the building tend to prove that he was.

There is very little doubt that he was occupying rooms in the Anderson Cottage in 1864. In fact, there is but little doubt that each summer while he was in the Presidency he had his summer White House at the Soldiers' Home. It is certain he did not occupy the Anderson Cottage in 1861, as that was occupied by the deputy and acting governor of the Soldiers' Home, Major T. L. Alexander. Lincoln probably used the governor's quarters during that summer. President Buchanan established the precedent of making the home the summer White House. He lived there during the summer of 1857. Others following Lincoln did likewise, the last being, perhaps, President Arthur.

Further evidence of the fact that Lincoln resided there during the summer of 1862 is found in the book by David Homer Bates, "Lincoln in the Telegraph Office." Mr. Bates was an operator in the telegraph office of the War Department and knew Lincoln well. He says that on November 9, 1862, the President sent the following telegram to Mrs. Lincoln, who was visiting friends in Boston:

> "Mrs. Cuthbert and Aunt Mary want to move to the White House because it has grown so cold at the Soldiers' Home. Shall they?"

Mrs. Pomeroy, the famous Civil War nurse, in her diary (as related in "War Reminiscences," by Anna L. Boyden) says:

> "On Tuesday last I had a pleasant ride with some Washington friends. We went first to the Soldiers' Home . . . . We rode around the President's country seat, which is one of the five houses . . . ."

An interesting story concerning Lincoln has recently come to the knowledge of the writer, and is corroborative evidence of his residence at the home during the summer of 1861: The President went to and fro between the Soldiers' Home and the White House in a barouche, escorted by a troop of cavalry; that it was his custom to go down the Seventh Street Road, which crossed

Part of the fine herd of certified Holstein-Friesians on the grounds of the Soldiers' Home.

Mr. Ford's Page

WHAT does the return of the American people to the paths of conservatism signify? It is not a repentance for some failure of radical extravagance. It is not psychical weariness induced by long dalliance with strange and alien ideas. It is not the sag back of an unprogressive people who have seen the promised land of revolutionary dreams but have not energy enough to enter in. The American people have returned to conservatism because it is the normal habit of their life.

Indeed, they have never left a true and normal conservatism. Not once in the story of their development is recorded an event which indicates that a radicalism foreign to their nature seized them and led them to overt action against the progressive continuity of their career. Even the American Revolution was undertaken for the enforcement of one of the most conservative Anglo-Saxon principles. There has never been a moment of the least danger of the American people going Bolshevik or revolting, because there is in this country no one for the people to revolt against but themselves. There have been moments when it was feared that some sort of a revolt might be started, but not by the American people. Aliens are present among us who would gladly upset our American liberty if they could, but that is a thing by itself, it is not native to the people.

THE people of the United States are returning to conservatism. After spending some years in hospitably listening to alien proposals, and thoroughly understanding what those proposals mean, they are more than ever convinced that their own American Idea is the only thing for America. The return to conservatism means that the people have satisfied themselves that they are on the right track. They believe that they will reach the desired social and economic goal by progressing along the tested and proved path rather than by turning again into the wilderness. No alien idea thus far offered has proved successful on its own soil. But the American Idea works out, not only in America, but wherever it may be transplanted. This is proof that our people have discovered and applied a universal principle.

In no country has there been achieved so large a degree of public opinion as in this country of ours. Public opinion is exceptionally developed and coherent here because underlying it is the element of public conviction. National thinking is deeply controlled by national believing. It is the beliefs of America that have proved her anchor. There are, in other parts of the world, national tempers which are predominantly cynical, or suspicious, or derisive; the big quality in our national temper is our insistent believing. That always indicates normality.

Now, it is just because our nation has this quality that it is able to extend hospitality to alien forms of thinking. Certainly there is no political philosophy, no social idealism, no religious cultism in the whole world which will deny the mental hospitality of America. About all that we have been doing the last several decades is extending that hospitality. And because we listened, but most of all because we actually understood, every form of alien idea has been encouraged to rise and shout that it had captured the mind of America!

They did not know that it was our capacity to understand them that was really their undoing.

What has occurred, and what is described as the return of the American people to conservatism, is this: the American mind, having extended hospitality to the utmost, and seeing that hospitality misunderstood and misinterpreted, is beginning to assert itself. The host of this great national house is speaking last.

This is the meaning behind the recent immigration legislation. One says this the more readily since to say it does not imply that the legislation was wholly wise. But there has come in this country a resurgence of the American idea, which the abusers of our mental hospitality had thought was overthrown, or about to be. It was not overthrown nor even seriously menaced, but it occurred to our nation just to make this fact clear in some unmistakable act. There is doubtless a better way of doing this than by shutting our gates to the peoples of the world, but that act at least is unmistakable, it is like a man decisively closing his doors to the ill-mannered ones who have taken advantage of his friendly and helpful hospitality.

It is an act which will have an awakening effect and is having one now. The reactions of the shut in and the shut out elements, as already developed, are worthy of being observed.

It requires only time to bring clearly to the minds of all immigrants that they came to this country because it was the kind of country the American idea had made it. They did not come to save the country from the consequences of the American idea, but to participate in the benefits which that idea has created. So that any claim that they had a hand in the creation of the American idea is to be mistaken by the matter of some centuries. A certain stock of people won a certain standard of life and liberty, and willingly shared it with others. The others do honor to themselves by showing an ability to appreciate that standard; they dishonor themselves otherwise.

It is gladly agreed that the material assistance, which all races who are capable of creative industry have rendered in the material development of the country as the necessary physical support of the ideal structure, is considerable. They have come from every quarter of the world, pioneers of their people, seekers of the benefits of America for their children. Prior to a few years ago, they came with the laudable purpose to "get in on" America for themselves and their families. They were glad to be here. They were glad to learn how to let America come into their minds. But they did not bring the American ideal here and plant it; it was here and planted before they came.

What they brought was an industrious spirit, a willing hand, a thrifty habit, a desire to build new family foundations in the land of promise. They have been rewarded for their contribution beyond their highest dreams. But they did not come to change America; they came to share it. Only men who seek their votes will falsely flatter them by saying that America is a kind of political stew made of the ideas of all nations. Those who came from abroad did not come to set up their old political ideas here, but to claim the shelter of the ideas already established here. To be sure they brought their customs, their traditions, their natural love for their native hills and rivers—and that is to their honor—but, freed from the false flattery, they would be the first to deny that they came here for any other purpose than to share Americanism. And we, on the other hand, can testify that Americanism is never so unworthy and weak as when it is found in a solution of foreign political ideas.

A large element in what we style the return to conservatism is this renewed consciousness of our American idea, and the responsibility which we have to keep it pure for the benefit of the world. We have listened so long to the alien idea, newly brought over, by later propagandist not by bona fide immigrants, that we have come back with a start to a consciousness of the hour which the clock of the world's destiny has struck.

The blame for whatever time we have lost falls only on ourselves. After all, no one can injure the American idea except Americans. The embargo that needs to be put on is against our own tendency to grow careless, to suppose that because we were born in the United States we are therefore fully equipped Americans.

Every generation has to be Americanized, taught that the nation represents a crusade for liberty, taught that our very existence is such a challenge to the powers of darkness everywhere that we are beset on every hand by unsuspected enemies. And our protection against these enemies is not to go gunning for them, but to keep the light of Americanism bright, for its very rays are potent to destroy all subversive forces that come within its range.

We are witnessing today the sobering of national thought as the result of national reflection. Alien ideas which sought to allure us have been failures in their native haunts. The American idea is a success for humanity.

A volume of 452 pages, durably bound, containing 98 of these articles, under the title of "Ford Ideals," will be sent postpaid for $1.00.

Is Indianapolis Wise in This?

NOT content with having a comparatively small bonded indebtedness, the city of Indianapolis has just issued $280,000 of four and three-quarter per cent bonds upon which the total interest charge will be $206,150, which is 73.6 per cent of the principal.

They are so-called serial bonds. In 1926 ten thousand dollars' worth of bonds will be paid off and the same sum annually thereafter until 1953, when the whole issue will have been liquidated.

By levying a direct tax of less than ninety cents per capita Indianapolis could have got this money without paying one cent in interest. The population of Indianapolis in 1920 was 314,194.

The assessed valuation of Indianapolis is $618,-444,460 and aside from this bond issue the bonded debt was but $6,579,500, which is but slightly in excess of one per cent of the assessed valuation.

The taxation necessary to carry this debt is proportionately so much less than that of the average city that the city of Indianapolis would be justified in raising such sums as $280,000 by direct levy rather than wasting $206,150 in interest upon such a loan.

The eighty-nine cents it would have cost each citizen to raise this loan will cost $1.54 by the present method.

Stands by Agent

THE indignant refusal of Premier MacDonald, of England, to recall H. A. C. Cummins, diplomatic agent in Mexico, upon the request of the Mexican Government, cannot be fully understood without taking into account the difference of custom in cases of this sort between England and America.

The United States has always held that when a diplomat becomes *persona non grata* his government should recall him upon receiving a hint to that effect and has acted accordingly where its representatives were no longer welcome.

However, England has always denied that any government had the right to ask for the recall of its diplomats. Lord Palmerston, the pugnacious prime minister who probably raised England's foreign standing to its highest, established so many precedents of this sort MacDonald would have been thought lacking in spirit if he had not challenged Mexico.

For a time, in 1856, it was felt the United States and England might come into a collision as a result of Washington asking that the English minister, Crampton, and the English consuls in New York, Philadelphia, and Cincinnati, be recalled for their activities in recruiting for the English foreign legion for Crimean war service.

Crampton was popular at Washington and the Cabinet was not enthusiastic about sending him home.

The English Government refused to recall Crampton and the London *Times* and *Post* demanded that our minister, Dallas, be given his passports if Washington expelled Crampton after London had refused to recall him.

The English business men and the liberal organizations were opposed to trouble and in spite of the uproar Palmerston informed Parliament that the Cabinet would "not terminate their present friendly relations with Mr. Dallas."

Lord Salisbury refused to admit the right of the United States to demand the recall of Lord Sackville when Cleveland asked for it. However, like Crampton, Lord Sackville was finally given his passports. It will be recalled that Sackville was inveigled into expressing his opinion of the Presidential candidates and although it was favorable to Cleveland, the anti-British could only be placated by action.

As to Mexico, England has been preoccupied with so many more serious problems that she has deferred recognition. The Mexicans have misinterpreted the situation and the warm weather was conducive to everyone losing his temper. It will all blow over.

Milk Cars

THERE are indications that the milk can will be discarded for a more economical container for large milk shipments to the big cities.

A number of special milk cars equipped with two glass lined steel tanks each holding three thousand gallons of milk, and with suitable pumping and agitating machinery, have recently been put into service. More of them are expected to be used.

It does seem inefficient to pile cars full of heavy cans which are wasteful of space and then go through the slow, expensive process of unloading them by hand, emptying and washing them, reloading them on to trucks and finally unloading them in the shipping districts. The milk can is a relic of the days when the fresh milk supply of even the bigger cities was a much simpler matter.

Nowadays the great seaboard cities reach as far as Wisconsin, Ontario and Quebec for fresh milk. The old cheese belt of up-state New York now sends its milk production to New York City.

Handling the fast trains carrying these milk supplies has become an important transportation problem. The trains of cars filled with empty cans have to be rushed back to production centers just as quickly as they were dispatched to the markets. One railroad has just developed a three-cylinder locomotive that has hauled trains of forty milk cars over the Alleghenies at an average speed of fifty-five miles an hour.

Jewish Chautauqua

IF THE Mormons, the Mennonites, the Methodists or the Masons were using our universities this summer for special lecture courses, the fact would attract attention, and the attention would not be resented. The Jews have been using our universities every summer for quite a while, giving lecture courses on Jewish subjects, all of which may be described under the general head of pro-Jewish propaganda. The lectures are delivered under the auspices of the Jewish Chautauqua Society, which commands large sums of money for this purpose.

The universities, colleges and summer schools to be favored this summer by the various rabbis engaged in this work (all the lecturers are Jewish rabbis) are as follows: The University of Arkansas, the University of Colorado, Clark University, the University of Illinois, the University of Iowa, the University of Louisiana; Farmington, Maine, State Normal School; Minnesota State Teachers' College, the University of Minnesota, the University of Nebraska, the University of North Carolina, the University of the South, the State College of Pennsylvania, the University of Missouri.

In some of the colleges, class credits are given for the courses. In the University of Virginia alone, thirty Jewish lectures will be given during the summer season.

There is no objection to any serious and respectable group being permitted to present its subject, be that group Greek or Barbarian, Christian or Jew, but this freedom of utterance must be dealt out with an even hand. If there is a Jewish Question which draws rabbis out to lecture all summer, is there not a danger of request being made to present that side of the matter which the rabbis may overlook? Take the subjects—"Civilization—What the Jew has Contributed to it," or "The Jew's Place in History"—which are to be discussed at most of the above institutions, is there any doubt that there will be striking omissions, which the scientific method would not permit?

As well read world news through the dispatches of the Jewish Telegraph Agency, as hope for historical perspective from the rabbinical lecturers who will appear in our educational institutions this summer.

Enforcing—What?

LAWS are not and cannot be enforced. Only the penalties attached to laws can be enforced. The notion of law enforcement as distinct from penalty enforcement has led to confusion in the nation.

What is a law? It is the common thought and practice plus government sanction: that is, the people have recognized their native rules of conduct as the accepted rules, and have formally laid them down in statutes. Thus it is idle to say that laws are imposed on people from above or from any source but themselves. The notion of our government being able to make laws which the people do not want is a ridiculous bugaboo which has no reality.

In a polyglot country like the United States it is sometimes made to appear that law is in contravention to the views and desires of great blocks of the population. Doubtless that is true. If American law represented the desires of some blocks of our population, it would be very different; just as American morals would be different if our moral standards were those of some of our newer citizens. But insofar as the American standard of conduct is concerned, that conduct which American native character may be depended on to approve, it is true that our laws proceed from our people, and have their sanction.

Attempts to establish the contrary view are based on the desire to drive a line between Government and People by representing the former as the master of the latter, which, of course, it is not and in this land can never be. Our Government, good or bad, is ourselves; and in its Government the Nation may behold itself as in a mirror.

Now, observance of the law is a foregone conclusion since the principles of the law were honored or observed before they were written on the statute books. The Government has no duty to go about enforcing obedience to law. Its duty in this respect is to enforce the penalties of disobedience to the law. And this it must do unless it is to take sides with the lawless minority against the law-abiding majority. In cases where the lawless minority and the enforcing officials have the same tastes with regard to the forbidden thing, the people have the sorry spectacle of their representatives and their enemies forming an alliance. There is more than enough of that condition present in the land today.

A pertinent application of this principle may be made to the prohibition situation. No one has inquired of the law officers if they think that obedience to the Prohibition law can be enforced. That is none of their business. They were not invited to advise the Nation as to what laws should or should not be made. Their business, according to their oath, is solely to see that disobedience to the law is punished as the statutes provide. That is all.

Nothing indicates the twisted view of law which has sinuously made its way into the public mind than the whines of public officials to the effect that this or that law cannot be enforced—the law in question usually being one that is displeasing to the riotous and sporty element. Such whines should be rebuked by every mayor and governor. Nobody asks a law officer to enforce obedience to law, but only to enforce the penalties of the law on those who disobey.

From Rico to Hawaii

THE plantations of the Hawaiian Islands will probably be manned by American citizens from Porto Rico instead of Japanese, as a result of the new immigration bill.

With a population of 1,300,000, Porto Rico has a surplus of at least 400,000 people.

The proposal has been made that army transports carry the surplus Porto Rico labor to the Hawaiian Islands either free or at a nominal fare. There were 5,602 Porto Ricans in the Hawaiian Islands in 1920. The climate and products of Hawaii are quite similar to those of Porto Rico, the natives of Porto Rico being accustomed to raising apples, coffee, sugar cane, pineapples and other products which are common to the two territories.

The Porto Ricans in Hawaii have shown a tendency to remain in agricultural work while all other classes of imported labor including the Filipino drift to the cities.

The Porto Ricans are unusual in that they are the only people the United States has annexed who have joyously assumed their new relationship. They make excellent soldiers under American training and standards of living. Two regiments in the Regular Army are made up of Porto Ricans. One is stationed in Porto Rico and the other in the Canal Zone.

The War Department asserts that inasmuch as the Hawaiian Islands were acquired as a military outpost, more attention should be given to the character of the population.

The Trial of Bishop Brown

Called "Modernist," But Behind the Times

By REV. FRANK S. BALLENTINE

BISHOP WILLIAM MONTGOMERY BROWN

Excerpts From the Charge

Formal Presentment of Bishop Brown to the House of Bishops by Bishops Hall, Francis and Gravatt.

To the Right Reverend, The Presiding Bishop of the Protestant Episcopal Church in the United States of America:

We, Arthur C. A. Hall, bishop in and for said Church, having jurisdiction in the diocese of Vermont, Joseph M. Francis, bishop in and for said Church, having jurisdiction in the diocese of Indianapolis, and William L. Gravatt, bishop in and for said Church, having jurisdiction in the diocese of West Virginia, on their oaths present:

That on to-wit the eleventh day of October, in the year of our Lord one thousand nine hundred twenty and on divers days and times thereafter, to-wit from thence hitherto, at the City of Galion, in the state and diocese of Ohio, and at the city of Chicago, in the diocese of Chicago and state of Illinois, and at divers other places within the United States of America, William Montgomery Brown, who was then and there a bishop in said Church, and formerly bishop of the diocese of Arkansas, but being at the time of the happening of the events herein set forth, without jurisdiction, having theretofore resigned the same, did hold and teach, publicly and advisedly certain doctrine contrary to that held by said Protestant Episcopal Church in the United States of America, in manner following:

Said William Montgomery Brown, having theretofore written a certain book entitled "Communism and Christianism," . . . .

In which book, as originally written, and also as added to and amended, he, the said William Brown, did publicly set forth and teach certain doctrine, in words and figures as follows (reference being made to the words and page numbers of the eighth edition thereof, published on or about the fifteenth day of April A. D. 1923) namely:

On page 22: "Within the social realm, humanity is my new divinity, and your (meaning thereby members of said Protestant Episcopal Church) divinity (my old one) is a symbol of it, or else, as I think, he is at best a fiction and at worst a superstition." . . . .

On page 51: "Orthodox Christians say that Jesus founded their sectarian churches, though each sect insists that he had to do with only one church, theirs. I doubt that he lived."

On page 61: "Do you not now see with me that the christ of the world is not a conscious, personal god, but an unconscious, impersonal machine? It is to the machine of man, not a lamb of god, to which we may hopefully look for the taking away of the sins of the world." . . . .

On page 81: "Gods in the skies (Jesus, Jehovah, Allah, Buddha) are all right as subjective symbols of human potentialities and attributes and of natural laws, even as the Stars and Stripes on a pole, Uncle Sam in the capitol and Santa Claus in a sleigh are all right as such symbols; but such gods are all wrong, if regarded as objective realities existing independently of those who created them as divinities and placed them in celestial habitations."

On page 82: "So far I have not found it necessary to renounce the Christian God or any of the things which go with him and I have no idea of doing this, any more than I have of renouncing the American Uncle Sam and the things which go with him, but I place the Brother Jesus of the Christian religion and the Uncle Sam of the American politics on the same footing with each other and with others of their kind as subjective realities. I could be a Jew and an Englishman as conscientiously as a Christian and an American." . . . .

On page 91: "'The Lamb of God that taketh away the sins of the world' is the sign of the zodiac, Aries (sheep, ram) through which the sun passes towards the end of March, when all the saviour-gods annually died and rose again." . . .

On page 106: "There is no rational doubt about the fictitious character of the divine Jesus." . . . .

On page 154: "From the viewpoint of the self-styled one hundred per cent Christians, I am a betrayer of Brother Jesus, because I do not believe that he ever had any existence as a god and that, if he was at any time a man, the world does not now and never can know of one thing that he did or of one word that he said." . . . .

All of said doctrine as contained in each passage above set out being contrary to that held by said Protestant Episcopal Church, as contained in the Book of Common Prayer and especially in the Apostles' and Nicene Creeds.

(*Signed*)
Arthur C. A. Hall,
Bishop of Vermont.
Joseph M. Francis,
Bishop of Indianapolis.
William L. Gravatt,
Bishop of West Virginia.

Charles Lemuel Dibble,
Church Advocate.

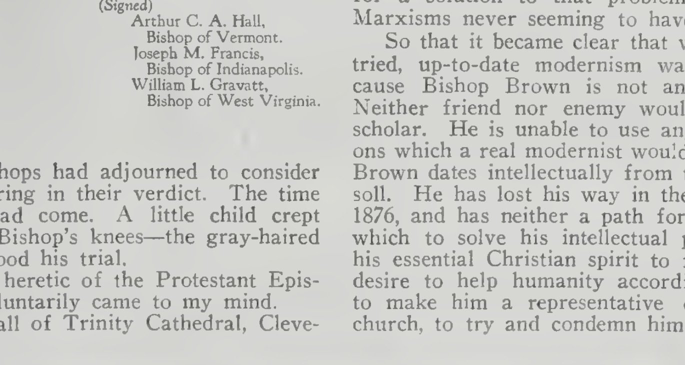
THE seven trial bishops had adjourned to consider the evidence and bring in their verdict. The time for their return had come. A little child crept from the crowd to the Bishop's knees—the gray-haired Bishop who had just stood his trial.

"So that is the arch heretic of the Protestant Episcopal espiscopate!" involuntarily came to my mind.

The scene was the hall of Trinity Cathedral, Cleveland. It was late in the afternoon and Bishop William Montgomery Brown was in the midst of his apologia. It was the story of his life he was telling, and the story of his mind as well.

He had been brought up in such ignorance, he told us, that when he was twenty-one years of age, he could not spell his own name correctly. A wealthy woman of Cleveland had taken him up and educated him for the ministry of the Episcopal Church. He had been a missionary at Galion, Ohio, his present home, and had been made an archdeacon. He wrote a book, "The Church for Americans," which had attained so great a success as a presentation of the orthodox Episcopal position, that much attention had been attracted to him, resulting in his exaltation to the Bishopric of Arkansas. (He told the writer privately that in those days his mission work was so easy that he "could make an Episcopalian out of a gatepost.") In this way he rambled on through his story, stopping here and there for humor and anecdote.

When he wrote his book, he said, he was as orthodox as any of the Bishops then trying him, as orthodox as the most orthodox of them could wish him to be, so orthodox that he had been invited to lecture at Kenyon College, at Gambier, in the Episcopal school of theology. He was going along happily in his work for the church when something happened.



Bishop Brown's beautiful and picturesque home at Galion, Ohio.

A physician called his attention to Darwin's book on the origin of species. He had preached against the Darwinian theory of evolution, but had never read Darwin's book. His opinion of it was formed at second hand, even at third hand. He was thoroughly converted to Darwin's theory. It had the effect of a revelation upon his mind. Then when the Great War broke, he was introduced to the work of Marx, and came to complete agreement with the Marxian position, and became a communist. So that his religion today may be described as Darwinian Marxism, which, as Benjamin Kidd showed in his "Science of Power," is a thoroughly German production.

Upon this change in his mind, Bishop Brown wrote his "Christianism and Communism," upon excerpts of which he was tried for heresy. The Bishop claimed that these excerpts did not correctly represent his position, but it is doubtful if any candid reader would say that they seriously misrepresented it. Doubtless, however, it is part of the fact of the matter that it is not alone the book but the Bishop's attitude and associations for years that formed the principal basis for the case.

One impression which grew with the hours was that the Bishop's science was almost as archaic as he represented the trial court's theology to be. He still glows over Darwin as the revelator of a new world, but seems to be unaware that Darwin has been seriously superseded in the scientific world itself. Marx's recognition of the social problem seems to answer in Bishop Brown's mind for a solution to that problem, the fatal defects of Marxisms never seeming to have touched him at all.

So that it became clear that whatever else was being tried, up-to-date modernism was not that thing. Because Bishop Brown is not an up-to-date modernist. Neither friend nor enemy would describe him as a scholar. He is unable to use any of the modern weapons which a real modernist would have wielded. Bishop Brown dates intellectually from the days of Bob Ingersoll. He has lost his way in the incipient liberalism of 1876, and has neither a path forward nor backward by which to solve his intellectual problem. He had only his essential Christian spirit to fall back upon, and his desire to help humanity according to his lights. But to make him a representative of modernism in the church, to try and condemn him as if modernism were being tried and condemned, was grotesque. The real modernists do not reckon Bishop Brown as one of themselves. They are one with the conservatives in this.

All this was brought out more clearly under cross-examination by his own attorney. In answer to questions, Bishop Brown told the bishops who were trying him that his introduction to the idea of evolution reorganized all his ideas.

"I made an examination of everything under the heavens," he said. "I lost faith in the supernatural. I saw flagrant misconceptions in the popular idea of the Scriptures. Observing my experience as a preacher, I saw that I never preached on miracles without treating them as parables. Then I brought my psychology to bear on the question. Why not consider heaven a state upon earth? According to the Bible, heaven is up, hell is down. But according to the science of astronomy today, there is no up and there is no down. In other words, what is up now, in twelve hours from now will be down."

Referring to the new revelation which he says Darwin and Marx brought to him, he said: "This new thing coming into the world is the actual living God. I might say with Omar: 'I myself am God.' The truth is great, but liberty to seek the truth is greater still."

He even said: "No supernaturalistic representation is denied by me. But I interpret it symbolically."

He says that he still believes in the Book of Common Prayer from cover to cover, and believes in the Bible in the same way, but reserves the right to interpret both spiritually, by which he means symbolically, with no essential literal connection. He said he assented to every article of the Christian faith as contained in the Apostles' and Nicene Creeds, but again claimed the right to interpret them spiritually or symbolically. In his book on "Christianism and Communism" he said, he "had no purpose of attacking religion."

Bishop Brown told how he had written to all the Bishops of the Church, when he found himself slipping away from the orthodox position, asking them to give him their counsel, but the result was that he became more and more convinced of the total bankruptcy of his former views.

In contravention of all this, the church advocate made his closing argument on straight statements of the facts as seen from the church point of view. Bishop Brown had denied God as an objective reality, and this contravened the first article in the Apostles' Creed, he said. Furthermore, Bishop Brown's explanations of his belief in the creeds evacuated those creeds of their meaning—first he made them mean something other than they patently mean, and then accepted them: which is contrary to the principle that no explanation is valid that destroys the whole meaning of that which is explained.

The church advocate insisted, however, that the Episcopal Church believes in a progressive revelation. He said the issue was not between Modernism and Fundamentalism. The Scriptures are a record of humanity's increasing receptivity of inspiration. Even the great university of Lausanne, he said, presided over by the renowned Cardinal Mercier, sustains and supports the doctrine of evolution and reconciles it with Catholic teaching.

The church advocate even admitted that it is permissible to deny the doctrine of the Virgin Birth, "but you must admit that Jesus was truly born."

I myself am firmly convinced that Bishop Brown is theoretically and intellectually very far from the right road. He has run wild with scraps of ideas and snatches of science. He was much more logical and convincing when writing on "The Church for Americans" than in any of his so-called "heretical" works. But that does not in any way change the essential factors of the trial.

I noted that the prosecuting attorney for the church never once by word or inference suggested the person of Jesus as the standard and norm of doctrine and life. It was the Prayer Book. It was the Apostles' Creed. It was the Nicene Creed. It was abstractions. It was theories. It was interpretations and inferences. The concrete, real Jesus he never referred to. Nothing seemed farther from the church advocate's mind.

Bishop Brown is, in my opinion, theoretically wrong But is this the way to deal with a man who is seeking light? "Him that is weak in the faith, receive ye, but not to disputations about doubts." St. Paul, a considerable authority, said that. Even the apostles did not assume to dictate opinions, for it was St. Paul again who said to the Corinthian church (which heaven knows had moral and intellectual heretics enough): "Not that we have dominion over your faith, but are helpers of your joy."

How does such a scene come to be possible?

Bishop Manning, at the height of the furor concerning Dr. Percy Stickney Grant, said in his own office that his advisors counseled him that he could not successfully prosecute Dr. Grant. Nor could he.

Paraguayan women in the market place at Asuncion.

Where East Is West

By CARROLL K. MICHENER

An Oriental method of burden-bearing inherited by the women of Brazil from the Moors of old Portugal.

The Moorish custom of carrying burdens atop the head persists in Panama and Brazil.

THE Moor planted in Spain his persistent essence of the Near Orient, and the Spaniard carried it onward into the New World. It is indelibly marked in cast of countenance, in walls and gardens, in philosophies of life, and in the whole social structure of Latin America.

Throughout the Spanish world, to begin with external and material evidences, the prevailing type of architecture is Moorish—low walls flush with a narrow street; massive guardian doors and windows jealously iron-barred; within, hidden from the life that passes except for perhaps a tantalizing glimpse, a patio open to the sky and sighing with the music of fountains and of green leaves. The archways that edge these patios and shield the walks confronting public squares suggest Arabian bazaars.

But the parallel of streets and houses does not end with Arabia. The Oriental world is much alike, whether east or west, and the narrow streets and blank walls of a Moorish city have their counterpart in China. There the retirement of a dwelling house within itself is even more pronounced. The iron-latticed windows—the *miradores* through which the woman of a Moorish-American household may look upon the somewhat forbidden world without—are suggested only in the gateman's niche, and the patio is a paved and flower-potted courtyard securely screened from prying eyes by the "devil wall" that is set before the door to keep out evil Chinese spirits capable of moving only in a straight line.

The wall that turns its side of rudeness and strength upon the outside world reflects, of course, an insecurity in the social order. It belongs to a period of medieval stress. But there are other things it mirrors as well, and chief of these is an attitude toward women. The harem is traditional among both Moors and Chinese, although the latter have foresworn it along with their dynastic past. And there is no harem without walls to shield and keep its treasures for the master's eye.

To escape from her walls has been the difficult task of the Latin-American woman. And curiously she is a short step behind the woman of China in suffrage emancipation, though the barriers of both are most peculiarly alike.

The Spaniard's attitude toward the other sex—and it is as true of South America today as of Spain—is a compounding of Gallic chivalry and Oriental contempt. The evidences are in all phases of Spanish-American life, just as they lie in the philosophies and moralities of Arab and Chinese. Proverbial literature is full of them, and the sayings of Spain and China are strikingly similar. Both are extravagant in praise of woman's charm each damns her frailties in acid ink.

One signal difference is the Spaniard's estimate of his mate's mentality. He appears to be fully conscious of her intellectual qualities, although he may be silent about them; and there is many a distinguished foreign observer of both Spain and Spanish America who has called the women superior in this respect to the men.

In China woman's mental potentiality is as great, though she has had less opportunity for development. Chinese literature, which is man-made, has not, however, confessed this.

Gentlemen of China and of South America have not been much accustomed to appearing in public with the women of their households, although in this the yeast of feminine emancipation has done some slight leavening. In general, one's wife, in China, is still relegated to the "inner chamber," and it is the professional entertainer, the "singsong" girl, who lightens the idle hours of tea houses and places of public amusement. In South America, likewise, the wife of Don Fulano languishes at home while he ranges at large to his men's dinners and to his various romancings. Just as it is a breach of etiquette to inquire after a Chinese gentleman's wife, so is it a false step for South American gentry to speak to the wife of an acquaintance should she be encountered unescorted in a public thoroughfare. Either custom hints of Oriental distrust, and the conviction that rigid conventions are necessary to safeguard weak woman from a predatory world.

In both China and Spanish America the restricted position of woman results in a matrimonial code iron-bound with convention. Courtship and marriage become family and clan affairs, rather than the business of individuals. The responsibility, financial and social, inhering in a daughter, creates the urgency of marrying her off at the most adventitious moment. This pressure, whatever else it engenders, leaves little room for old maids, who are not numerous either in the Spanish world or in the Orient. A spinster is a cull in the matrimonial market, and there is little other refuge for her than the veil.

Still another common urge, working constantly against the state of celibacy, is philoprogenitiveness.

Curiously, these races so adept in parenthood evidence alike the weakness of spoiling their children. The autocratic family ruler in neither Spanish America nor China is capable of leashing his own indulgence or the resulting arrogance and wilfulness of his children. They have no proper discipline, and, indeed, Chinese children, in spite of the Confucian teachings of filial piety and reverence for age, are by no means taught to obey their parents. As a rule their notion of prompt obedience is of the haziest character.

As for the aboriginal inhabitants in the Andes region of South America there is in their children quite another resemblance to the Orient. They make no such infant outcry as their white fellows, but exhibit, apparently from birth, the stoicism toward pricks and pangs of life that is inherent in the Oriental mind.

In their general effect the bronzed, crop-haired urchins of the Andes, with their sloe eyes and the Mongolian slant of their cheeks, are a striking reminder of the East. In no more dramatic situation is this true than in the schools, from the classrooms of which can be heard the ululation of a continuous chorus of study aloud, just as in the schools of Old China. The simile can be carried even further, for there is an emphasis upon memory training, through committing to mind fixed answers to formal textbook questions—a system not wholly alien to that of the old learning in China, which consisted very largely of memorizing the classics.

But the striking parallels that exist between one-half the New World and most of the Old end, by no means, with the women and children. One who knows the Orient is more than likely to be instantly aware, upon landing in Peru, of a certain familiarity in his surroundings. Reminiscences and suggestions of the East will crowd upon him in the Narrow thoroughfares, emerging from the sounds, the smells, the very walls, and above all else from the Mongolian tint and contour of indigenous faces. These first impressions will multiply rapidly. They may well become an obsession.

To make a record of some of these coincidences is not, it must be understood, to offer a new ethnological theory. There has been enough

Left—This ferry boat at Havana would be at home among the Sampans of Shanghai.

Asia and America in a Bolivian village.

Santiago, Chile, except for its straight streets, resembles an Oriental city. With its flat roofs, low buildings, and arched facades, it is reminiscent of Granada, the last stronghold of the Moor in Spain.

At right—An Oriental avocation upon the streets of Lima, Peru.

controversy of that kind over the origin of the American Indian, an argument centering about the popularized assumption that the Red Man came from Asia or the Pacific Islands, either by way of the Bering Strait and Alaska or upon ships driven by storms and ocean currents over the long sea routes.

The proponents of this theory refer to such historical records as Indian hieroglyphics that resemble the Chinese, ancient Mongolian implements and coins found in the Pacific Northwest, and early visits by Oriental mariners to points on the western coast of the Americas. They speak of the striking likeness of the old Mexican religion to early Buddhism, and of certain resemblances between religious practices of the Incas and those of Asia. There was a belief in transmigration of souls, for example; and the monastic system in Mexico, the religious festivals in both Americas, the worship of household gods, the burning of incense and the chanting of prayers—all these were similar to the theological forms of China.

Likenesses were to be found as well in customs political, martial, industrial and architectural. The rope bridges in old Peru were made of twisted willow branches, almost exactly like the twisted bamboo bridges in various parts of China. Throughout the four thousand years of Chinese history, the emperor plowed a furrow annually, with a yellow share, in deference to the empire's fundamental occupation of agriculture, and in Peru the same ceremony was performed with a plow of gold by the reigning Inca. There were like parallels in the use of charms and amulets, in the practice of cremation, in preservation of the ashes of the dead in urns, and in the idea that an eclipse was produced by a celestial dragon swallowing the sun or moon.

The Incas kept their records by means of knots tied in strings of various colors and shapes, called *quipus*. And in the Chinese histories it is set down that a similar primitive system was in use before the invention of writing. The counting frame of the Peruvians is said to have been little different from the Chinese abacus that has not yet ended its usefulness. The *chasquis*, those swift postmen of the Incas, who carried not only messages but parcels—delicacies of the coastal gardens being transported to royal tables over the long mountain leagues before their bloom found time to wither—had their prototypes in ancient China.

Then there was the matter of ears. In old Peru, as in China, good fortune was in direct proportion to the size of these appendages. It was the grotesque belief of Cathay that one whose ears were long enough to reach his shoulders would attain to the highest felicity. And there was the legendary example of the great Liu Pei, whose attainment of such an auditory dimension enabled him to found a dynasty. Part of the ceremony of admitting young Peruvian nobles to the Inca chivalry was the piercing of their ears with a golden bodkin, which was allowed to remain there until an opening had been made large enough to accommodate the enormous pendants that were peculiar to their order. In the case of the sovereign Inca these ornaments were so large as to distend the cartilage of the ear until it reached nearly to the shoulder, producing what seemed to the European eye a monstrous deformity, but a thing of beauty and fashion in the regard of the Peruvians. "The larger the hole," comments one of the Spanish conquerors, "the more of a gentleman."

These and other things establish a suggestive, if not a conclusive, relationship between ancient Peru and the East. To quote Prescott, the historian: "The subjects of the Incas, in their patient and tranquil devotion to their native soil, bore greater resemblance to the Oriental nations, as the Hindoos and the Chinese, than they bore to the members of the great Anglo-Saxon family."

Whatever question there may be as to the Far Eastern orientalism that exhibits itself in South America today—by coincidence, if for no other reason—there can be no argument as to the secondary influence from Western Asia. The Spaniard, for seven centuries, went to school to the Moor, and the entire Spanish world still wears the Oriental mantle of Moorish custom and thought.

It is interesting rather than extraordinary, therefore, that the social order in South America should be in so many points similar to that of the Far East. The clan spirit of the Orient—to continue with these parallels—is well marked in the Spanish-American, though it is not developed to the Chinese extreme, which results sometimes in an entire village or provincial district claiming a single name and one family hierarchy. Family solidarity, nevertheless, is strong in those of Spanish blood, and just as the sons cling to their father's house in China, so does young Don Fulano de Tal bring home his bride to join the company of his mother and probably her numerous brood of daughters and daughters-in-law. There is often what seems like a small village housed under some old Spanish-American roof, though time and change do what they can to disrupt this feudal grouping.

An Oriental corner in Paraguay.

Such a form of family life has an inevitable effect upon the whole social structure. Charity begins and ends mainly within the consanguinous circle, and public spirit is shackled close to its near and exacting demands. This is one of the serious difficulties of modern China, which is still saddled with nepotism and interprets public weal too much in terms of its cousins, its uncles and its aunts. Spanish America possesses the wider background of Europe for its political adventures, but the clan spirit no doubt has a great deal to do with its many inauspicious experiments in the realm of democracy.

The seclusion of the harem and the promiscuity of life in the large family group suggest a singular incongruity. In spite of the barriers that hide the home in both China and South America there is a degree of publicity in the business of living that would be intolerable to the Anglo-Saxon, who must be sometimes alone. This is doubtless the outcome of a swarming, compressed family circle. Both peoples seem calloused to close and constant personal contact.
